FOR at least two decades American city politics from the kitchen bars of Portland, Maine, to the Tia Juana race track has moved in fixed grooves. So machine-like have been the pulsations, despite all the sound and fury of "reform," "clean-up" progressivism and changes in form of government that this writer once conceived the project of formulating the science of city politics on mathematical lines; in other words, of introducing among the sciences *the dynamics of demagogy*. The test of any science is the ability to make accurate predictions on the basis of its principles and data. This could be done unfailingly under recent conditions and can still be done with a fair chance of success in a majority of American cities.

To cite a concrete instance, which serves to illustrate the whole theory: In the fall of 1919, the writer was induced to assume the editorial management of a "lame duck" newspaper in a western city noted for the virulence of its politics and the number of spectacular reformists and uplifters which it had produced. This city, by the way, years ago passed through the political phases which the two "hick" towns of America (Chicago and New York) are now undergoing.

The city in question had changed its form of government so many times that its inhabitants looked back on such things as the commission form of government or the initiative and referendum with a sort of dim reminiscence in which they were jumbled with the Declaration of Independence, the Missouri Compromise or free silver.

The municipality was equipped with every form of ordinance, commission, bureau or other device of regimentation which could have been conceived by the most optimistic advocate of the improvement of the human species. A German Burgomaster of the old régime would have envied the mayor of this mountain metropolis the legal grants which gave him the right to regulate intimately the lives of its citizens. *In theory, nearly everything was verboten; in practice everything "went."*

Despite all these ultra modern improvements, the writer, who had come from a city where they were so crude that they still copied their primary registration lists out of the city directory and frequently imported extra voters from Chicago, did not feel out of place. After a few days' inspection it was easy to see that the good old game was still being played in the good old way. The three essential factors of political power here as elsewhere were: First, *patronage*, which all professional politicians know is more than half the game, but which the people have never appraised at anything like its real importance; second, *anti-social privileges*, including liquor, commercialized vice and questionable amusements—in short, the whole open or closed town "agenda"; third, *public utilities*.

Every problem of political tactics *for the past 30 years* can be reduced to a process composed of these three factors. Given the environment and "background," any such problem can be worked out mentally or on paper with the certainty of a chemical reaction or simple algebraic equation.

Mark that this statement applies to the *past* 30 years. The fact that it *no longer* applies is the reason why city politics is in chaos and the politicians are running around in circles. Why these three factors no longer encompass the whole field of city politics, is the reason this sketch is written.

But to continue our illustrative story of the city of terrestrial altitudes and political pitfalls; the writer was informed shortly after his arrival that the city administration, which our paper was supporting, had been returned to power a few months previous in an exciting election in which the victorious candidate had been opposed by the banking interests, the church element, the public utility corporations and by practically all citizens who dodged large income tax levies except a few oil magnates who belonged to the Rooseveltian traditions of Armageddon. They had "battled for the Lord" so successfully that with the aid of the Mexican, Russian, Jewish and Italian vote, plus the assistance of our newspaper, they had polled about eight thousand plurality. Our paper, which had always been stridently for the "common people," although very few of them bought it, had tried to deliver the "labor vote" along with the rest, only to discover for the "steenth" time "that there ain't no such animal." The other newspapers, whether yellow or black, had supported the big money combination.

How aud Why "Crusades" Are Started

AFTER the situation had been outlined to the writer he asked his predecessor: "When will the vice crusade begin?"

"Why vice crusade?" he asked. "This isn't an open town. At any rate it's a Sunday school burg compared to 'Frisco or Omaha."

"But didn't you tell me your traction company has only succeeded in raising its fare to six cents and had to put over a framed-up strike to get that?" I asked. "They need seven to pay dividends. This mayor of ours got elected by promising a five-cent fare. He is a good fellow, but not a crook and rather hard boiled. He was a Federal marshal so long he has the cop's psychology. You ought to know that under such circumstances the financiers figure he must be removed. How do you attack any city administration? Every man who has ever worked for our newspapers knows how. Through the police department! Our game and the mayor's game is to try to convince the people that all the wide-open town talk they will start is inspired by the traction corporation, and he will have to give the boys' a little leeway too. A mayor with a corporation fight on his hands cannot usually afford a closed town."

It was only 25 days later that an 18-month vice crusade was begun.

This little situation is an example which could recently be duplicated in hundreds of cities and states. From the time of the Civil War until after the death of Mark Hanna, the liquor interests and its subsidiaries usually worked hand in glove with the privilege-seeking corporations—usually the railroads in the states and the public utilities in the cities. About 15 years ago public utilities found that their liquor allies were becoming a burden rather than an asset and began to seek alliances with the militant moral element.

This process, of course, was gradual. In Pennsylvania, for instance, the liquor-corporation alliance has probably not ended yet. In Tennessee, it ended in 1903. In Cleveland and Toledo aggressive anti-corporation mayors like Tom L. Johnson and Brand Whitlock were continually assailed by those that thought they were too lenient with the "liberal" crowd. Practically everywhere the political play was something like this. The "outs" attacked the "ins" with one of two charges—either that the "ins" favored the wide-open town element, or the public utility corporations. Formerly, if the "ins" were radical, they usually antagonized the public utilities and favored the "wets" and open-town elements. If they were conservative they usually favored the financial and corporate interests and endeavored to win popular support by warring against vice.

Municipal politicians early learned the lesson of military strategy, that the finest defense is an attack.

Nearly all campaigns in great cities during recent years have waged around public utilities, or the conduct of police affairs. In the days when public service corporations really exercised some influence in city politics, bitter onslaughts were launched against them. Real abuses of corporate franchises were seized upon by demagogic politicians and magnified a hundredfold. Once the idea of the predatory, unscrupulous, insolent corporation was created in the mind of the voter, it was easy for each election's new generation of candidates to keep it alive, whether the abuses ceased or not. What might be absent in sincerity was easily made up for in ferocity of the attack.

In cities, where, for one reason or another, the public service corporation attack was not as effective as could be desired, the question of the regulation of gambling, the social vices, crime, was a paramount "issue."

In the days of the saloon, the city administration in power was able through its control of the police department to dictate how much of after-hour and Sunday violations of the laws should be permitted. It was able through a combination of fear and favor to command the so-called saloon vote—the saloon-keepers, bartenders, their dependent relatives, drifters, and others. It was natural that the "outs," envious of this solid vote in favor of the "ins" should inveigh against the "wide-open town," "police protection," and seek thereby to corral the sincere law-enforcement element in the city. Gambling and the social evil were similarly used by politicians among the "outs" as talking points in campaigns in which police corruption or inefficiency was being assailed. This comparatively simple political system is now dead or dying everywhere.

Saloon Was a Powerful Factor

PATRONAGE is still a powerful factor, although during the war period when official salaries were so much smaller than even the earnings of an incompetent in private industry it lost a great deal of its potency.

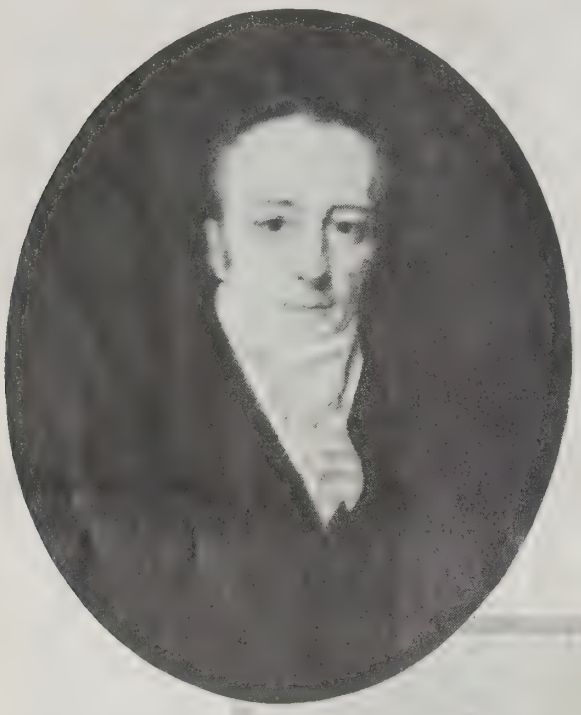
Prohibition has about finished the saloon as a political factor. It survives to a vastly diminished extent in Chicago and a few smaller cities, but grows weaker every day. Some people may doubt whether prohibition prohibits. The professional politician entertains no misgivings as to its political potency. It has smashed his whole world. There is simply no substitute for the saloon as a unit of political organization. Those people who regarded the saloon as merely a place where drinks were sold never grasped one-tenth of its social significance. It was really the only place in which half of the people even seriously discussed politics. It was, indeed, a poor man's political club. Had it not been for the debasing grip of the synthetic-liquor makers, brewing syndicates and the politically controlled police departments upon the American pot house, it might probably have had some justification as a democratic debating society. In its crude way, it supplied community relationship and solidarity. It also supplied political leadership—mostly bad but not altogether so. Years ago, there were saloon keepers and bartenders who were men of good counsel and keen political guidance for their rough fellows, but that was before the Americans, Germans and Irishmen were run out of the business by the Mediterranean and Alpine and Mongoloid criminaloids, who were subsidized by alien brewers and whisky distributors.

The political influence of the public utility corporations has been approaching zero in the same ratio that the value of their common stocks has been approaching the same point. The utility companies are now really out of politics. They got the worst of it and they know it. For a long time they exerted a corrupting influence and sometimes ruled with iron hand. Those were the days of franchise steals and the bribing of city councils. Then came the reaction led by men like Tom L. Johnson, of Cleveland, and scores of worthy imitators throughout the country. The professional politician quickly discovered that it was suicidal to play the game for the utilities and profitable to bait them.

Public Utility Baiting Almost Passe

IN RECENT years, for one sincere opponent of public utility interests in politics, there have been twenty or thirty demagogues who have used the issue and its battle cries for their own ulterior purposes. Some of the worst political gangs in America today retain their precarious hold on power by ferocious verbal attacks on bankrupt public utility corporations which have not the political influence of the monkeys in the zoo, and which are, in fact, completely out of reach because they are in the hands of Federal courts.

Perhaps there is no more disheartening spectacle for the well wisher of city democracy than the success of these gangster medicine men and shamanists. In the more backward cities, like New York and Chicago, they beat their tom toms and howl in their tepees and large sections of the people still believe that they are frightening away the evil spirits and bogey men of the traction and gas companies.



People are beginning to recognize it as old stuff. How soon a majority will recognize it as such is the question. When a majority does understand how long it has been fooled by the sham battles of politicians against lawbreaking and against public utilities—battles in which deafening volleys of blank cartridges have been fired at each other by the opposing political batteries—when a majority does understand, there can be no doubt that a great disgust will sweep the present generation of politicians from power. The freak elections of last autumn show that the understanding is spreading.

The next phase—? This is history, not prophecy.

The Smithsonian: the Nation's Greatest School

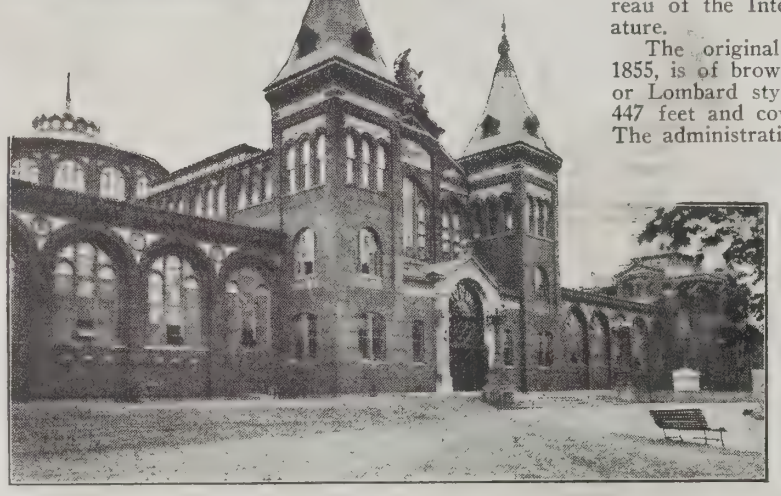
Origin and Growth of Museum Founded on Gift to America by Son of an English Duke

By H. O. BISHOP

JAMES SMITHSON,
Founder of the Smithsonian Institution at Washington.

Main building of the Smithsonian Institution.

WASHINGTON boasts one of the most remarkable public institutions in the world in the Smithsonian Institution, fitly situated about midway between the Capitol and the Washington Monument. It is an institution with a history that goes back nearly 100 years. Curiously enough, America owes "the Smithsonian," which has taken its place as an institution scarcely less national than Congress itself, to the bounty of an Englishman. Standing out as conspicuous a feature of the architecture of the capital city as the monument or the White House, our country is indebted both for the idea which it embodies and the nucleus of the considerable fund that made that embodiment possible to a foreigner, who never even visited the United States and who in his lifetime was not suspected of cherishing the least interest in this country or its future.



James Smithson, founder of the Smithsonian Institution, was a natural son of Hugh Smithson, first Duke of Northumberland, known, as is the present holder of the title, as a conservative of conservatives and one having little esteem for republican ideals in government or society. In early life, James Smithson was known as James Louis Macie, his mother being Mrs. Elizabeth Keate Macie, member of the well-known Hungerford family. Born in France in 1765, he was educated at Oxford, where he won his Master of Arts degree. Thereafter, he devoted himself to scientific study and research, becoming one of the foremost mineralogists of his time. In 1787, he became a fellow of the Royal Society, before which he read, in the course of his subsequent career, no less than 28 notable papers, 18 of which were published in Thomson's "Annals of Philosophy."

He spent most of his time on the Continent and died in Genoa in 1829, having three years before made a will bequeathing his entire estate to the United States of America "to found at Washington under the name of the Smithsonian Institution, an establishment for the increase and diffusion of knowledge among men." Some hint as to the motive that induced him to give his fortune to the American Republic, then in its struggling infancy, rather than to his own nation, is found in a writing relative to the bequest making this prediction: "My name shall live in the memory of man when the titles of the Northumberlands and the Percies are extinct and forgotten."

It is surmised that a sense of wrong in the illegitimacy of his birth alienated him not only from his native land but also from its aristocratic institutions. In the degree in which he lacked reverence for British hereditary nobility and privilege, he probably developed keen appreciation of democratic ideals and the opportunities offered in the new republic for individual and national advance. Merit, rather than the accident of birth, must have been the lodestar in the life of a man who by sheer work and achievement—proving ability of the first order and a character that endeared him to most of the notable scientific men of his age, succeeded in carving out for himself a career of marked distinction and usefulness. He probably felt also that in the free air of America the sciences he loved would flourish as they never could in the old world.

Poetic, if tardy, justice was recognized when, in 1904, Smithson's remains were brought to this country and interred in the grounds of the institution he founded.

It was not until six years after Smithson's death that the British Government officially notified the then Secretary of State at Washington, John Forsyth, of Georgia, of the bequest. Its strangeness seems to have been a veritable surprise and one that somewhat nonplussed our officials. President Jackson, in December, 1835, turned over to Congress the papers in the case, accompanied by a message asking prompt action. The Senate referred the matter to the Judiciary Committee, while the House appointed a special committee to investigate "the propriety" of accepting the unusual gift. It was not until July of the following year that the law was enacted empowering the President to obtain possession of the Smithson fortune, Richard Rush, of Pennsylvania, was appointed as a special agent to go to England and collect the money. At the end of two years he had succeeded in settling up the estate and brought home $508,318.46 and a notable collection of minerals made by Smithson.

United States National Museum, Arts and Industries Building, Smithsonian Institution.

Half a million dollars was "big money," indeed, in those days, when the first American millionaire had not yet dawned on the horizon. The money was deposited in the United States Treasury, where for eight long years it remained without earning interest and more or less of a problem. Although President Van Buren, in his message of December 6, 1838, invited the attention of Congress to the obligation devolving on the United States to fulfill the object of the Smithson bequest, Congress kept on discussing and "considering" the matter year after year, until August 10, 1846, when the act was passed under which the bequest was invested in government bonds as a trust perpetually entitled to an annual income of six per cent as an endowment in perpetuity of the Smithsonian Institution.

Definite resources were thus assured for carrying out the purposes of the founder. Since the original bequest by Smithson, other bequests and gifts have come to the institution from generous benefactors, varying in sums from $250,000 to $1,000 or less, so the total invested permanent fund now aggregates more than $1,000,000, and is increasing from year to year. Unfortunately, the original Smithson collection of minerals was destroyed by fire in 1865.

In discussing the acceptance of the Smithson bequest in 1836, John Quincy Adams, in the House of Representatives, said: "Of all the foundations of establishments for pious or charitable uses, which ever signalized the spirit of the age, or the comprehensive beneficence of the founder, none can be named more deserving of the approbation of mankind than this. Should it be faithfully carried into effect, with an earnestness and sagacity of application, and a steady perseverance of pursuit, proportioned to the means furnished by the will of the founder and to the greatness and simplicity of his design as by himself declared 'the increase and diffusion of knowledge among men,' it is no extravagance of anticipation to declare that his name will be hereafter enrolled among the eminent benefactors of mankind."

Eighty-six years have passed since Mr. Adams spoke those prophetic words. The Smithsonian Institution is today known to all men of science, and its founder's name is everywhere held in the highest esteem. He has a monument that his noble ancestors might well envy.

In receiving the property and accepting the trust, Congress constituted an administrative establishment, whose statutory members are "the President, the Vice-President, the Chief Justice and the heads of the executive departments." The business of the institution is conducted by a board of regents composed of "the Vice-President, the Chief Justice of the United States, and three members of the Senate and three members of the House, together with six other persons other than members of Congress, two of whom shall be resident of the city of Washington and the other four shall be inhabitants of states, but no two of them of the same state." The regents elect one of their number as chancellor, usually the Chief Justice, who is the presiding officer of the board, a suitable person being elected as secretary of the institution, who also is secretary of the board and the executive officer and director of the institution's activities.

The annual income of the institution is now about $100,000, derived from interest on the permanent fund (in the United States Treasury) and on special funds, and contributions from various sources. This income defrays the operations of the institution proper. There are, besides congressional appropriations annually of about $600,000 for the maintenance of the bureaus or branches of the institution that have been developed beyond its early activities, including the United States National Museum and the National Gallery of Art, the International Exchange Service, the Bureau of American Ethnology, the National Zoological Park, the Astrophysical Observatory and the United States Bureau of the International Catalog of Scientific Literature.

The original Smithsonian building, completed in 1855, is of brownstone in the twelfth century Norman or Lombard style of architecture. It has a front of 447 feet and covers about 60,000 square feet of land. The administrative offices are here, as also are several sections of the library, the museum division of plants or national herbarium, and the division of graphic arts; also the offices and the library of the Bureau of American Ethnology.

Adjacent to the administrative building on the east is the Museum of Industrial Arts, built of brick in a modernized Romanesque, covering about two and one-third acres, and completed in 1881. Here are exhibited objects relating chiefly to the arts and industries and to American history.

On the north side of the park is the Museum of Natural History, completed in 1911. This fine structure is of granite in the classic style, with dome and columned portico. It covers an area of about four acres and in its ground floor and the three floors above it there are 468,118 square feet of floor space, one-half of which is devoted to exhibition purposes, the other half being utilized for storage rooms, offices, laboratories and other purposes. As the latest of the great museum buildings of the world, it embodies many not found in earlier museums. Here are displayed the collections pertaining to anthropology; biology and geology, and the National Gallery of Art.

Through the generosity of the late Charles L. Freer, of Detroit, there has been erected in connection with the National Gallery of Art, a special edifice of artistic design to house the splendid collection of American and oriental works of art presented to the institution by Mr. Freer, who also placed at the disposal of the institution more than $1,000,000 to defray the cost of the building.

The Astrophysical Observatory is housed in a group of small wooden structures south of the Smithsonian administrative building.

The National Zoological Park, which has become one of the most attractive features of the Smithsonian Institution, occupies 169 acres in Rock Creek Valley, in the northwest section of the city.

The Smithsonian plan of organization embraces the two objects named by the testator; one, the increase of knowledge by the addition of new truths to the existing stock; the other, diffusion of the knowledge thus increased. No restriction is made in favor of any one field of knowledge, and hence each branch is entitled to and receives a share of attention. Part of the plan has included the formation of a library of science and art, a museum, a gallery of art and pro-

visions for physical research and popular lectures.

The activities of the institution embrace all branches of natural science, the fine arts and the industrial arts. It has at all times fostered progressive scientific research. Since its establishment the institution has inaugurated and maintained, or has had share, in a great number of astronomical, anthropological, biological and geological expeditions and explorations in every portion of the world, resulting in largely increasing our knowledge of the geography, the meteorology, the fauna and flora, and the ethnology of all lands, and in the acquisition of a vast amount of valuable material for the National Museum.

The Smithsonian is not an "educational institution" in the sense which the term applies to a university with a corps of professors and students, and yet its educational functions are of the highest rank, for the members of its scientific staff and their many collaborators are constantly engaged in investigations in which students of science the world over participate. The museum collections and the collections of animals in the Zoological Park are, morever, a constant source of original information for specialists and groups of pupils from public and private schools in Washington and elsewhere.

The institution aids investigators by making special grants of money for research and exploration. It advises the government in matters of scientific importance. It co-operates with all departments of the government and with many scientific and historical national organizations.

By the act of 1846, the Smithsonian Institution was made the custodian of the national collections in both nature and art—a very important provision. The museum branch was definitely organized in 1850, the title "U. S. National Museum" being authoritatively given to it by Congress in 1875. During the first few years the expenses of the museum were wholly met from the Smithsonian fund, and it was not until 1878 that the government began to make further provision for its maintenance.

Four general divisions are recognized: Natural history, including ethnology and archeology; the fine arts; the industrial arts, and history.

The division of natural history is divided into three departments: biology, geology and anthropology. The collections of natural history have been received in greater part from government surveys and explorations, and are richest in material from North America. Many other parts of the world also are well represented in one subject or another, especially Central America, the Philippines, Malaysia, some portions of Europe, Africa and South America. The deep-water zoological collections from both the Atlantic and Pacific oceans are the most extensive and important in existence.

Among important early sources of these collections may be mentioned the United States Exploring Expedition of the Amazon Valley in 1838 to 1842; the Perry Expedition to Japan; the North Pacific Exploring Expedition of the Navy; the railroad and wagon road surveys by the army in connection with the opening up of the Far West; the Canadian and Mexican boundary surveys; certain geological explorations, and the work of the coast survey in Alaskan waters, besides many expeditions organized or assisted by the Smithsonian Institution itself. Of more recent date are the investigations of the Bureau of Fisheries, the Geological Survey, the Bureau of American Ethnology and the Bureau of Plant Industry, Entomology and Biological Survey of the Department of Agriculture. Of private donors, some of whom have made gifts of great extent and value, the list is very long.

The specimens recorded in all branches of natural history up to the present time number a total of several millions, the annual accretion during several years past having averaged a quarter of a million specimens.

Of arts and industries, there are on exhibition extensive collections of firearms, the most complete in this country; boat and railroad models, electrical apparatus, timekeeping and measuring devices, musical instruments, ceramics, graphic arts, textiles, laces, embroideries and collections in mineral technology and in photography.

The growth of the National Museum has heretofore been greatest in natural history lines, including exhibits relative to primitive man. The development of the natural resources of the country and the study of the American aborigines through government surveys and explorations have contributed toward building up collections illustrative of nature and early man that certainly equal and perhaps surpass those of any other country. The millions of specimens and hundreds of thousands of distinct species and forms serve as the bases for extended researches and discoveries. Through co-operation with the executive departments of the government, the museum collections are a constant aid in solving problems in agriculture, in mining, in fisheries and in Indian affairs. Unrivaled conditions are here afforded for the arrangement, care and safety of the nation's treasures, for unrestricted study of them in the advancement of knowledge, and for their use in promoting and broadening public education.

In recent years, great advance has been made in the development of the department of technology—a Museum of Industrial Arts. It is in this department in particular that the museum fulfills one of its chief functions. The exhibits are so selected and so installed as to teach visitors how articles of use are made and what they are made of. The exhibits illustrating the textile industries and mineral technology, in particular, are very complete, consisting of specimens of raw materials, machinery used in manufacture and the finished products.

The division of history has likewise been greatly broadened in recent years. Here are displayed memorials of many leading American soldiers and sailors, inventors, explorers and men of science, and memorials of important events in American history. A collection of costumes worn by ladies of the White House during each administration since 1789 is of much popular interest.

The museum has been defined as one of record, of research and of education. As a museum of record, it preserves the very foundations of an enormous amount of scientific knowledge in the many thousands of typical specimens gathered in natural history investigations, and these are increasing rapidly. As a museum of research, the collections serve as a stimulus to inquiry and as foundation for further investigation. The installation of exhibits is carefully planned to make the museum an actual aid to public education. Natural objects and varied and myriad manifestations of human thought and activity are illustrated by specimens bearing descriptive labels. Races of men are illustrated by groups of figures in their native costumes; mammals, birds and other zoological specimens are each assembled in groups amid representations of their natural surroundings.

It is "a consultative library of objects," an agency for the instruction of all the people of the country, "and it serves the needs of those whose lives are not occupied in the study of science, as well as those of the professional investigator and teacher."

CHARLES D. WALCOTT,
Secretary, Smithsonian Institution since 1907.

Natural History building of the Smithsonian Institution.

Oval—Freer Gallery of Art, Smithsonian Institution.

Elk group in Smithsonian Institution.

The foundation of a National Gallery of Art was contemplated and directed in the act of organization of the institution in 1846 and in the program of operation adopted by the board of regents in 1847. But several years passed before the art gallery was actually opened. This national gallery received very great stimulus in 1906 through the bequest of Harriet Lane Johnston, niece of President Buchanan; the munificent gift of Charles L. Freer, already mentioned, and the gift of William T. Evans, thus bringing into national ownership several rich collections of paintings and other objects of art.

The William T. Evans gift included more than 150 carefully selected works of modern American painters; the Charles L. Freer collection, numbered some 5,000 items of paintings, sculptures, pottery, bronzes, jades and other works of art, as well as a collection of 82 drawings in pencil, pen, charcoal, chalk, crayon and water color executed by eminent contemporary French artists.

The donation by Mr. Freer of his collection and his provision for its preservation form one of the most notable gifts of its kind in the world's history. Mr. Freer describes his collection as follows: "These several collections include specimens of very widely separated periods of artistic development, beginning before the birth of Christ and ending today. No attempt has been made to secure specimens from unsympathetic sources, my collecting having been confined to American and Asiatic schools. My great desire has been to unite modern work with masterpieces of certain periods of high civilization harmonious in spiritual and physical suggestion, having the power to broaden esthetic culture and the grace to elevate the human mind."

The Bureau of American Ethnology is an outgrowth of early ethnological and archeological researches of the institution, and of later investigations conducted in behalf of the Commissioner of Indian Affairs to determine the affinities of the various tribes of Indians and to serve as a guide in grouping them on reservations, as it was believed that an effective classification of the tribes materially reduced the danger of warlike outbreaks. A vast amount of linguistic and bibliographical information relative to the American Indians has been published by the bureau, and great collections of ethnological material have been gathered for the anthropological department of the museum.

The collection of mammals, birds and reptiles in the National Zoological Park numbers about 1,400 individuals, representing some 360 species. Its visitors now average about 2,500,000 each year, including many groups of public and private school students accompanied by their teachers. Wild turkeys, partridges, peacocks, squirrels and wild rabbits wander in perfect freedom throughout the park.

One of the principal aims in establishing the park was to promote the preservation of races of animals threatened with extinction, such as the American bison. Several bison were procured for the park and have thrived there.

There are several cages for birds in the park. The great "flight cage," 158 feet long by 50 feet in width and height, is built over several full-grown trees and has running streams supplying pools for the water fowl, of which there is a valuable collection.

Among the particularly important exhibits is a fine collection of ungulates, or hoofed animals, no less than 50 species of wild cattle, deer, sheep, goats, antelopes, horses and their kindred.

The Astrophysical Observatory, founded in 1890, investigates solar radiation, and solar phenomena generally.

Charles Doolittle Walcott, the present head of the Smithsonian Institution, was born at New York Mills, Oneida County, New York, in 1850. He became interested in scientific affairs at the age of 13 and his interest has increased every year since. He obtained a grasp on the practical side of life by working for two years as a clerk in a country hardware store, selling everything from currycombs and jews-harps to plows and threshing machines. He also spent several years on a farm doing all sorts of things. He entered the government service in 1879, as a field assistant of the Geological Survey. In 1891 he was advanced to the position of chief paleontologist. In 1894, President Cleveland appointed him director of the Geological Survey. In 1907 he succeeded Professor Langley as secretary of the Smithsonian Institution.

Round-head Influence Blights American Letters

Age of the Vulgar, Rule of the Plebeian, Comes to the American Novel

IN A most notable article on the causes of the decadence of present-day American fiction, Gertrude Atherton, in *The Bookman* for March, has been wise enough to find the racial key and courageous enough to turn it in the door of hushed-up facts. The first part of her article deals with the origins of the distinctive racial strains which have made a vital impress on human progress.

Mrs. Atherton's thesis is that the three ancestral races of Europe were the Nordics, the Mediterraneans and the Alpines. The *Mediterraneans*—long-headed, dark, small and lightly built—came from Southern and Southwestern Asia and were responsible for the civilizations of Asia Minor and Northern Africa. They pushed across to Spain and France and, entering the British Isles, became the "ancient Britons." The *Alpines* came to vigor on the Iranian Plateau, and their kinsmen who turned east became Mongols. They are round-headed, stocky and powerful. These Alpines are placed, in Mrs. Atherton's thesis, in a part of France, a part of Germany, Czecho-Slovakia, Poland, Austria, Hungary, the Balkans, Jugo-Slavia, Finland and Russia. The *Nordics*, originating in the grass-lands of Russia, were of great stature, fair hair, blue or gray eyes, white skin, and a great genius for war and government. They were of longer and greater face and head measurements than the Mediterraneans, and had straight noses. They are the Anglo-Saxons—Scandinavians, Hollanders, Saxons, British, Huguenots, Irish and other strains of the same general breed.

It is not necessary to accept Mrs. Atherton's thesis in detail, especially as to the origins of these distinct streams of human potency. Racial origins present a problem as yet hardly touched, and Mrs. Atherton may have overlooked a most important consideration as to the possible origin of the Nordics. But in separating the streams and bringing them vividly to view, she has done a creditable and highly useful piece of work.

The civilization which we call Christian and modern is a Nordic creation (to use Mrs. Atherton's racial designations, which a later generation may revise). Especially is this true of the civilization of America.

But over the civilization thus created and established there has flowed vast volumes of Mediterraneans and Alpines. The wars of the world for civilization and liberty have mostly devastated the Nordics. Mrs. Atherton expresses a common fear for the future of the Nordics which, perhaps, is not justified. But this does not invalidate her statements of fact.

Readers interested in this phase of the question should procure her entire article: what is presented here is her most important diagnosis of the effect of the Mediterraneans and the Alpines on the literature of America.

Distinguished Minds in Early Literature

LARGE numbers of people have been asking, "What has come over American fiction?" As one of the masters of American fiction, Mrs. Atherton offers an answer which will repay thoughtful attention. She says:

What have all these hard facts to do with fiction? Too much, unfortunately. The early literature of this country was aristocratic. It was written by Nordics. (Fancy a round-head writing "The Scarlet Letter"!) It continued to be written by aristocrats for many years. The "people" were by no means ignored, but over them was shed the light of the distinguished mind of the author. Even the minor story tellers, slavishly imitating the lighter novelists of England, their facile talent lacking originality, had a certain grace and distinction.

The great bulk of American fiction today is essentially plebeian. The few exceptions make the fact more startling. The cause is not far to seek. With the enormous influx of European plebeians the poison of democracy began its deadly work. The sun of the *republic* started on its westward course. This heterogeneous mass was given the vote, its children were admitted to the public schools, heretofore sacred to Americans, and the Declaration of Independence was given a free interpretation never intended by its authors.

I am by no means contending that these millions of aliens and their descendants should have been kept in a condition of ignorance and slavery. That would have been sheer brutality, and what is more to the point, would have been demoralizing in its effect upon the superior race. We opened our gates from motives of expediency and enterprise, and our exaggerated idealism compelled us to give to immigrants equal rights as citizens. If we had been wiser we would have been more merciful and just in the matter of wage and living conditions, and reserved the citizenship for those who after many years proved themselves capable of using it to the advantage of the country.

IN YOUR disgust with the tone of modern American novels you have asked, "What has happend to us? What new poison is this creeping upon us?" And you have not been able to answer. Gertrude Atherton has the answer. The answer is "Race." More and more the vital importance of "race" in every phase of our national life is impressing itself upon intelligent minds. By permission of The Bookman, in whose March number the article appeared, THE DEARBORN INDEPENDENT *herewith reprints Mrs. Atherton's answer. The title is, "The Alpine School of Fiction."*

And who will blame the newcomers? Downtrodden in their own countries, or at best unable to earn a decent living, they set sail for the promised land full of hope and humbly grateful. But humility and gratitude endured briefly. The spirit of liberty in the new land of infinite resource went to their heads. They wanted the United States of America for their very own. They knew as little of anthropology as the still entrenched Nordics and cared less. They recognized only human rights and the superior right of numbers. As time went on millions rose in the social scale. They intermarried with the Americans of the old stock and the process of breeding-out began. Having gained so much they wanted more, and from their ranks emerged every known variety of agitator, crank, and fake religionist. . . .

There is no doubt that this political readjustment and its consequent recreation of the old American ideal would raise the tone of our fiction. It was the pecuniary and political success of these immigrants and their intermarriage with Americans that not only bred the spirit of democracy among themselves but made it the fashion. The tone of the small towns (and this includes the small towns in great cities) steadily declined. The original American in mass may have been uncouth and unlettered but he was not common. Today the great mass of the "American people" who have prospered in a small way—to say nothing of those that have risen higher still—are commoner than anything the world has ever known. They are smug and dull and vulgar, their standard of manners must make a well-trained English servant feel himself a superior being. What they call idealism is cheap sentimentalism; reticence is unknown, or resented; those that fain would practice the pride they have read of and servilely admired, merely succeed in being "stuck up," and correspondingly ridiculous. If they encounter natural pride they experience an acute pain in their itching ego. Nor is this the worst. The tone of these groups, infinite in number, is forcing its way upward and altering the tone of society in every stratum it permeates. It threatens to become a sort of social flu which attacks high and low alike. This is the secret of the lowered tone of what was formerly called the best society, unjustly laid to the war. Society like literature is suffering from the democratic flu. In losing its class pride, its aristocratic standard, it has lost its self-respect.

Scoff at Standards of Ancestors

OF COURSE, it was inevitable that these conditions should be reflected in fiction; not only because writers inclined to naturalism and deficient in imagination depict the obvious, but because the majority of our present writers were born and bred in small towns. Some, no doubt, are of the old American stock, with the features and coloring, to say nothing of head measurements, that denote their inheritance from the greatest of the three races. But they are the victims of the lowered standards of their environment, they scoff at the aristocratic standards of their ancestors, they are rampantly democratic because it is the fashion; not realizing that they are slavishly imitating the new democracy of a race that would have been totally incapable of founding the republic whose inestimable benefits its multiplying numbers enjoy and abuse.

I am making no argument for a fiction that shall deal only with people of exalted birth and position. Nothing would be more tiresome. I am only protesting against the deification of the common and vulgar. As an illustration, compare the stories of Mary Wilkins, who began her career some thirty-five years ago, with the "small town" fiction of today. Miss Wilkins wrote entirely of village life and humble people, but not only was she gifted with that distinction of mind which would have enabled her to write of a city slum without offense, but the American simplicity of her village types was then untainted by the hideous commonness with which the small town reeks today.

Now, there is probably not a small town in the United States that has not at least a small proportion of Nordics, proud of their descent, well educated, patrons of literature and whatever other arts may come their way, who travel when they can, whose accent is inoffensive, and who adjure the vulgar colloquialisms which distinguish the speech of the major population—who, for the most part, were their schoolmates. But these exceptions are ignored in fiction, possibly because they are honestly regarded as non-typical by the disciples of Zola—who, it may be pointed out, has never been admitted to the rank of first-class novelists.

Were it not for Booth Tarkington the world would be forced to the conclusion that there was not an American of the old stock left in the Middle West. No one has ever questioned the truth of Tarkington's characters and scene; and yet he gives his people precisely the same setting beloved of the naturalistic school. But he is, I will venture to say, an undiluted—and uncorrupted!—Nordic. He naturally selects real Americans like himself for his mental playmates and, possessing imagination as well as mental distinction, he is an artist, not a reporter. The fiction of the Atlantic states is still to a certain extent under the influence of the Nordic or genuine American tradition. So far, the higher type of eastern novelist at least has not felt the effects of immigration, possibly because the importations are herded in the large cities and segregated by their poverty. It is the millions that have spread over the middle and northwest who are responsible for the blight, and, as a fashion, at least, this blight is creeping into California.

It Is Not American Fiction

THE Alpine influence in American letters has never been so signally demonstrated as in the large and increasing number of midwestern novels that have achieved so remarkable a notoriety during the last year and a half. ("Brass," a good piece of work in spite of its detestable characters, may be included in this group, although its scenes are laid in California.) Every character in them all is a round-head, brachycephalic, Alpine. Not a real American could be found among them with a magnifying glass. No one can blame these writers for their fierce intellectual reaction from the sickly sentimentalism of a far more popular school of fiction. They started out with a fine determination to "tell the truth for once," to sterilize American fiction, to do something new. But their pendulum swung too far. In their breathless hunt for the obverse of lollypops they discovered only tadpoles.

Not one of all these novels contains a character or condition worthy of the striking cleverness expended upon it. And they are as un-American in the true sense of the word as the work of those forgotten minor novelists who flourished before the Civil War.

For all I know every one of these writers may be of the best American stock, Nordics (although I have my doubts). But they have been democratized and debased by their round-head environment. Their Nordic mental inheritance, if not their physical attribute, has been "bred out." Nevertheless, there is no disputing their cleverness, which now and then rises to the dignity of talent—never to genius. The trouble is they are not clever enough—unless, to be sure, they ask for nothing but the passing and remunerative vogue—; for they have missed the chance of making lasting contributions to American literature. Possessed of uncommonly sharp vision, they focused it upon telling types to prove a false thesis, instead of permitting it to range over the entire field and discover the wheat in the chaff. Convinced they were writing real American fiction for the first time, they have succeeded in giving us an assortment of creatures derived from inferior Asia. The Nordic is creative. He has immense initiative. Not a character in this entire group of novels has a semblance of the creative spark, an ounce of initiative. One and all are the feeble puppets of circum-

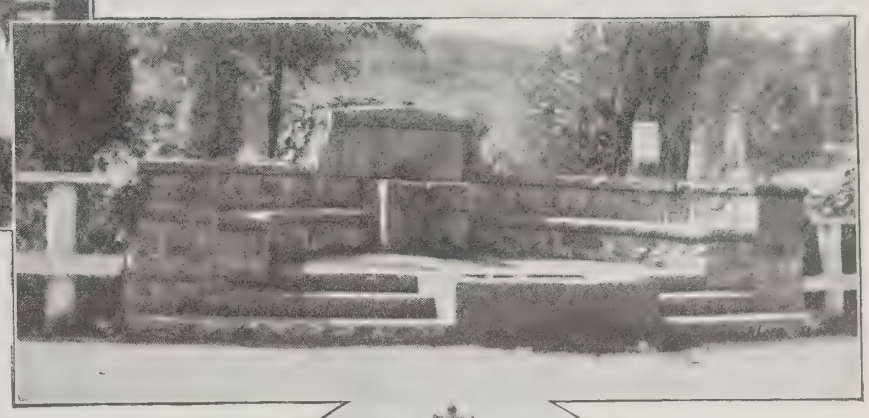
Bleak Roadsides—How They Can Be Improved

Memorials Along Highways Add Charm and Preserve Local History

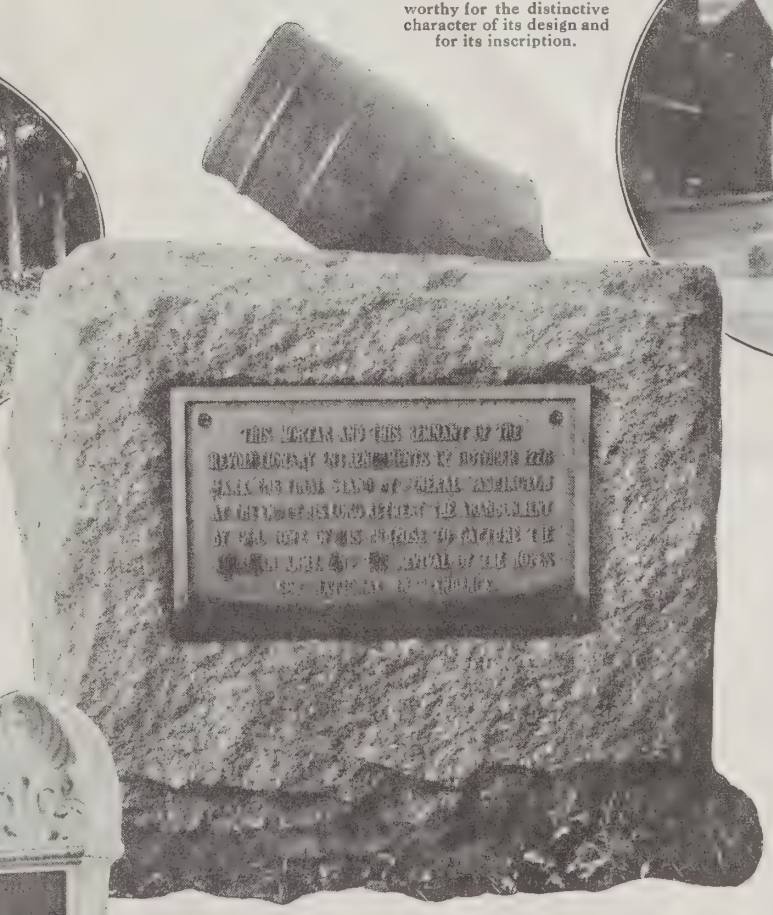
By GEORGE S. BRYAN



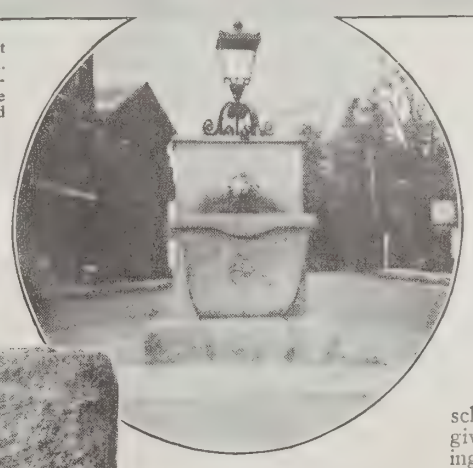
ALONG the highways of the New England, and to a less extent of the central states, the old-time traveler encountered many picturesque bits that have since been quite thoroughly devoured by time. A hollowed log held water for his horse. He read his distances by carven milestones. He paused at quaint tollgates and drew rein at the equally quaint swinging signboards of taverns. He passed over echoing covered bridges whose cool darkness he welcomed after the hot glare of the dusty road. Sometimes the bridge might be a graceful arch of native stone, enveloped in clambering vines.

Rustic drinking troughs and their wooden conduits have decayed. The milestones that lined the old post roads and turnpikes have been battered down or dug up, save for a few that, defaced and hidden in weeds, remain to be pointed at as things curiously archaic. Tollgates linger, if at all, remotely and obscurely. The ancient tavern signboards must be sought in storerooms and attics. Almost all the covered bridges have been removed as unsafe, or long since gone downstream with a spring freshet. The stone arches have been variously disfigured.

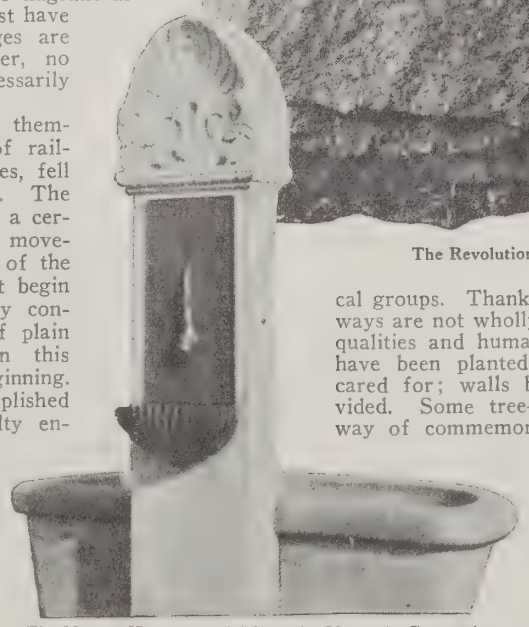
Many of the roadside drinking places have been obliterated; thirsty horses and humans look for them in vain. When the place of the log trough has been filled at all, it has too often been filled by a cylinder of rusty iron or an affair of ugliest concrete work. In lieu of milestones we have a rather indiscriminate lot of guideposts with a jumbled array of signs—some of which we owe solely to the commercial enterprise of advertisers, and all of which may be termed unattractive if not positively unsightly. For the charm of the swinging signboard we have the brutal offensiveness of the monumental billboard. For tollgates we have filling stations whose ugliness is usually so flagrant as to force the conviction that it must have been studied. The earlier bridges are succeeded by contraptions; safer, no doubt, but, it would seem, unnecessarily hideous in design.



A close-up of the Fremont memorial fountain. This is the favorite stopping-place for travelers.



The memorial fountain at Crossriver, New York. This memorial is noteworthy for the distinctive character of its design and for its inscription.



The memorial to William Hamilton Gibson, on the highway near Washington Green, Connecticut.

The Revolutionary memorial at White Plains, New York.

A memorial fountain at Southport, Connecticut. It commemorates the part played by early settlers in fighting Indians.

The Nathan Hale memorial fountain, Norwalk, Connecticut.

As far as concerns the roads themselves, these, with the advent of railways and the decline of turnpikes, fell generally into a wretched state. The bicycle did, indeed, bring with it a certain impetus toward a good-roads movement; but only with the arrival of the motor vehicle did this movement begin to effect practical results on any considerable scale. As a matter of plain fact, scientific road-building in this country is still virtually in its beginning. What already has been accomplished exhibits frequent traces of faulty engineering, inadequate construction and political jobbery. Under these conditions, it is scarcely surprising that *roadside treatment* has thus far received from our state officials almost no attention whatever.

Anyone who has traveled at all on our state-built roads, is aware how contractors have been allowed to abandon rubbish that should have been cleaned away; how banks and excavations have been left raw and rough when they should have been smoothed and sown with grass seed. Fine, sound trees have frequently been cut down; of necessity, perhaps, in some cases. Yet new trees have not been planted, in spite of the admitted fact (clearly stated by the late Logan W. Page, director of the United States Office of Public Roads) that trees, besides increasing the beauty of the road and the pleasure of the traveler, help to keep "hard" roads from unduly drying out, serve other protective functions, and are thus important in the reduction of maintenance costs.

It is desirable that existing picturesque features of our roads be, as far as possible, preserved; and that elements of permanent beauty be added. Aid in these directions is scarcely to be expected from state officials. In the East, an intelligent initiative has been displayed by individuals and local groups. Thanks to them, our modern highways are not wholly to be destitute of attractive qualities and human appeal. Shrubs and trees have been planted; grass plats laid out and cared for; walls built; ornamental signs provided. Some tree-planting has been done by way of commemorating service in the World War. The idea is excellent, and many communities will doubtless plan to adopt it. Nor have the possibilities of the more formal wayside memorial been overlooked.

We do not line our highways with grave stones, as men lined the Street of the Tombs outside ancient Athens; nor as they lined for miles the historic Appian Way. We have not the shrines and crosses such as once were so commonly raised by the highways of the Old World. But wayside memorials are wholly proper to our civilization. They will nobly help to prevent our modernized roads from being mere ruthless and monotonous stretches.

Fairfield, Connecticut, has converted into a bulletin board its ancient whipping post on the green. At White Plains, New York, has been kept a fragment of the earthworks built by American troops when Washington concentrated his forces in the neighborhood. The spot is marked by a ruggedly-fashioned granite block bearing a bronze tablet and surmounted by a primitive mortar. The text of the tablet reads: "This mortar and this remnant of the Revolutionary entrenchments of October, 1776, mark the final stand by General Washington at the end of his long retreat, the abandonment by General Howe of his purpose to capture the American Army, and the revival of the hopes for national independence."

The course of the post road between Boston and New York is marked with rather exceptionally frequent memorials of other days. One of the most pleasing and interesting of these is the Nathan Hale fountain at Norwalk, Connecticut. It was from Norwalk that Hale crossed to Long Island on his perilous mission as a spy. In the memorial, placed by the Norwalk chapter of the Daughters of the American Revolution, a stone trough for horses is backed by a plain stone shaft terminating in graceful anthemia. The pennies of school pupils were given for the making of this tablet to celebrate a teacher who wrote of his school keeping: "I have thought much of never quitting it but with life, but at present there seems an opportunity of more extended public service." It is to be regretted that the fountain continues anomalously dry.

Not so the Frémont fountain on the Albany post road above Tarrytown, at no great distance from the memorial bridge that spans Pocantico Creek and pays a not wholly adequate tribute to the genius of Washington Irving. This fountain stands at a widening of the road, and in the arc of a substantial wall that provides a frame for the memorial proper. Cold, clear water pours from a bronze lion's head. Groves border the spot; and here in the shade on almost any fine day passers-by are constantly halting to fill their cups and to read the bronze tablet which tells that the fountain is

IN MEMORY OF GEN. JOHN C. FREMONT, "THE PATHFINDER," A FORMER RESIDENT.

The writer inclines to think that the most thoroughly artistic and delightful fountain memorial he has yet seen is that at Crossriver, New York. It is of masoned stone, toned in general to the color of the walls that fence the neighboring fields. In the very friendliness of its design, this memorial seems fairly to welcome you. Set in the wall above the upper basin is a stone slab on which is carved this inscription:

Spirits of Water, Earth and Sky
All Gather Here
Where Once Dwelt One Who Like This Spring
Was Sparkling Sweet and Clear

This is all. Neither name nor date helps to complete the story. A summer resident, they tell you, thus honored the memory of his wife—with a reserve that we may well respect.

Another fine wayside memorial to an individual is that at Washington, Connecticut, to William Hamilton Gibson, well known for his interpretations of nature through illustration, lecture and the printed word. The country about Washington long furnished Gibson with material for his studies.

On the long slope from Washington station up to the Green, somewhat above the highway and framed by trees, is a large boulder, in which is set a bronze medallion in bas relief. The medallion, by the accomplished sculptor, Henry K. Bush-Brown, shows Gibson half-length in the out-of-doors garb familiar to his friends.

Banks Use Print to Crush Money "Heresies"

Country Flooded by Propaganda of American Bankers' Association; Periodicals Spread Viewpoint of Present Money System's Friends

YOU think that the banker in your town is "pretty clever" when it comes to discussing problems of which you read and on which you seek more light. Proposed loans, tariff legislation, this, that and the other thing, which may affect you and the prices of *your* products, all are disposed of conversationally by the man to whom you look for credit, with a finality that at times is awe-inspiring.

He will probably tell you, if you ask him, that he is forced to depend for many of his views on the big-bank groups back in New York and that his talk reflects the sentiments of those groups. That what you are obtaining as his own information and judgment is in reality what has been passed on to him precisely for the purpose to which it is put—for distribution by word of mouth to "the people." Ask your banker to let you read some of the publicity he receives.

By AARON HARDY ULM

JOHN D. PRITCHET, who, we'll fancy, is president of a First National Bank in a town of five to ten thousand inhabitants, is quite an important person in his community. Previously, Mr. Pritchet was a business man, perhaps a wholesale grocer or a hardware merchant. His has been and still is a busy life. He knows his own community, his own people, his own business so well that he rarely errs with regard to them. He is held in awe by his neighbors. Whether they like him or not they respect his judgment. His relations with most persons in the community are peculiarly influential, for they have to do with money. Through his bank he is intrusted with many persons' funds and those in need of financial accommodation go to his bank for loans.

The very fact that Mr. Pritchet has "knuckled down to business" to the extent of becoming a dominant man of affairs in his community signifies that he has not been able to give much time to the study of national and international questions. He knows them well enough to form firm and often sound opinions. Frequently, he can express those opinions much better than he can defend them. This isn't because a good defense is impossible but because he has had no time to master details and formulate ready-to-hand arguments. If someone else happens to do that for him, Banker Pritchet's efficiency as a medium for influencing public opinion is greatly increased.

In this day of super-propaganda, there are agencies ready to assist the banker in wielding to the fullest, the power his position gives him to influence public opinion.

Propagandists Are Experts

MANY of the huge banking institutions of the big cities now maintain departments which are essentially propagandist. They "feed" smaller banks expertly prepared matter dealing with public questions that affect the banking interests. The matter is also sent to others who may be interested. Much that is ready-made for printing is offered to the newspapers for publication as news or general information. And now the American Bankers' Association is planning to get out a publication for bank depositors alone, to be circulated through the banks. Its circulation will be immense.

"Of all organized propaganda now put forth in this country, I think that which originates with and clears through the banks is the most significant," a student of the subject declared recently. "It can be, if it is not already, very powerful. This is because the banking interests can and do employ the best publicists to prepare the matter they circulate, and because their avenues of distribution are the best in the country. The real directors of the 'research' or 'publicity' departments of the big city banks which now engage in what comes within the true meaning of propaganda are often high-ranking officials."

George E. Roberts is a vice-president of the great National City Bank of New York City. He is the generally recognized supervisor of that bank's publicity activities. Mr. Roberts undoubtedly is a capable financier but he is first and foremost a publicist, and an able one. He was for many years a newspaper man and is the author of several books. He was long Director of the United States Mint.

Francis H. Sisson occupies a similar position with the Guaranty Trust Company of New York. He was a newspaperman and magazine editor. He ranks as vice-president of the trust company. Guy Emerson who is with the New York Bank of Commerce likewise was a distinguished journalist before he engaged in banking.

Banks Now Court the Public

THE same can be said of Martin Egan, who is with J. P. Morgan & Company, which several years ago felt constrained to give expert attention to the avenues of public opinion.

The Morgans, however, do not deal in "publicity" of the usual varieties. They get out no publications giving "interpretative" surveys. The other banks named and some others carry on editorial functions similar to those of any magazine.

The National City issues several periodicals. The Guaranty Trust issues bulletins dealing with matters of public interest. The Bank of Commerce gets out an economic review. Banks in other large cities also issue publications dealing in the main with economic and often with all kinds of public questions. There goes from the "publicity departments," like that of the National City Bank, much prepared copy for newspaper use.

The publications issued by the big city banks are sent free. They go to the banks' correspondents throughout the country. Practically every small town bank is a correspondent of some big city bank.

There is scarcely a bank president or cashier in the country who is not the regular recipient of publicity matter sent out from the big banking centers.

Bankers still are the most conservative class and the most reluctant to adopt innovations. Bank advertising is a comparatively new phenomenon. Until within the last 25 years most bankers looked upon the newspaper advertising as undignified and dangerous. It is now generally engaged in, but conservatively. Bankers are inclined to keep out of general political agitation. It is doubtful if they have ever wielded more than a moiety of their full power to influence public opinion.

It was as recent as 1896 that the American bankers discovered what they might do toward influencing public action. Undoubtedly, it was due largely to their more or less concerted activities that the gold standard was saved. The writer once heard a former president of that body declare that the American Bankers' Association "saved the country."

Since 1896, bankers steadily have given increased attention to public opinion. They, with similar interests, have learned that they must look to the voter more than to the man in office and that the man of little means often has more to do with prevalent opinion than the man of large affairs. They have learned, as one prominent propagandist put it recently, that "the crowd is in the saddle, the people are on the job, and we must take consideration of those facts whether we like them or not."

Off-hand one would think it difficult for a banking institution in Broad street or in Wall Street, New York, dealing almost exclusively with big interests, to reach the "crowd" effectively. Aside from its instinctive prejudice, the "crowd" is taught to view with suspicion anything originating from such circles. Of course, great financial interests often wield influence over supposedly independent newspapers and magazines. But that is not an adequate resource, for it sometimes nullifies itself in the long run. It is probable that the new publicity methods are more effective and are far less open to criticism.

They can be particularly effective in the case of banking, because of the extent of the business and its touch with virtually all activities, and because of the tendency of bankers toward more or less uniform views. Banking is closely organized. It is the most interdependent business. Whatever the individual may think of bankers in general, he is likely to have considerable respect for the judgment of his own particular banker.

Small Banker a Propaganda Spreader

WHEN John D. Pritchet, president of the First National, unbends to discuss the wage question or the money question with William Smythe, local merchant or farmer who deposits his funds in and borrows from Pritchet's bank, Smythe is prone to give weight to what Pritchet says. This is especially the case when Pritchet backs up his thoughts with a surprising grasp of fundamentals and cogency of argument. The merchant or farmer will not know that Pritchet is parroting from a bulletin sent out by a New York bank or by the American Bankers' Association. He will not know that the information and the arguments conveyed to him by his banker are the results of studies by high-priced economists and put into print by equally high-priced publicists. In many cases those facts, no doubt, should give weight to what is said; for a great deal of sound information of high value is thus circulated and much honest and able thought is applied to its interpretation.

The banking interest, of course, claims that only what is good for the country as a whole is good for it. Any other interest can say the same thing. But the saying of it does not subvert the fact that there is conflict of interests, whether because of disagreement as to what is best for all or because of the selfish attempt of one interest to profit at the expense of others.

No one employs an attorney to promote justice *per se;* that is left for the state, which employs the judges. Economists and publicists employed by a banking institution, or a group of institutions, certainly are not on the same plane as those supported directly by the public. Their studies and pronouncements may not be directed toward the immediate profit of their employers, but they certainly will not express a viewpoint hostile to their employers' interests.

Hence, what an economist or publicist, employed by a bank, puts out by way of information or interpretation must come within the classification of propaganda. It may be and usually is honest propaganda; sometimes it serves the general public interest; but by the very circumstances of the case it must comprise other equations.

Thus, you find most of the economics put forth by banks try to prove something. The economist's part is to develop facts which tend to back up the contention to be made. The publicist exercises his art in making the contention clear and convincing.

> "Heresies" are the chief evils which banking propaganda seeks to combat. And most proposed changes in the prevailing financial system are "heresies." Bankers as a class generally so rated the Federal Reserve System when it was proposed. Now that the system is established and satisfactory to the banks, attacks on it are rated as "heresies." The recent change in the law, by which it was proposed to compel the appointment of a farmer as a member of the Federal Reserve Board was rated in current banking propaganda as a particularly vicious "heresy."

It was contended that the system should be managed by bankers alone. Yet, a large proportion of bank officials were not of the banking profession when they became directing heads of banks. Frank A. Vanderlip, ex-president of the National City, was a newspaper man when he became an official of that institution. The nearest to anything like banking experience he had had was as an official of the United States Treasury Department.

They Take Up Wage Question

YOU will find in a recent number of a periodical circulated by the National City Bank a lengthy discussion of the "paper money heresy."

Lately, many publications issued by the banks have dealt vigorously with the question of wages, contending, at least between the lines, that all current industrial troubles are owing to the continued inflation of wages.

A year or two ago, Bolshevism was the chief subject of attack; now it is mere radicalism which most engages them.

Of course, what the big bank says about such things is likely to be taken seriously by many little bankers, who, by passing it on as their original thought, can cause it to be taken quite seriously by numberless non-bankers.

But what the individual banks are doing—though the volume of their publicity outpourings is growing tremendously—is not yet considered sufficient.

The American Bankers' Association is now planning a most elaborate propaganda venture. It comprises a four-page publication to be called "Facts." It is to be prepared for depositors whose subscription at a nominal rate is to be solicited by bank members. It is to present "such information as the following":

"1. That if there is to be prosperity, the world's production must equal or exceed its consumption, and further that production must be sufficient to enable consumption to a higher degree than mere human existence.

"2. That wages in the long run can never exceed in value what the labor for which such wages are paid adds to the wealth of the world.

"3. That every bank depositor is a capitalist."

New Plan Encroaches on Newspapers

THE purpose to be served by the publication has been defined as follows:

"1. To promote an understanding on the part of the public of the basic principles underlying economic development.

"2. To supplement and crystallize the efforts toward educational work along economic lines that are already being conducted by individual banks, chambers of commerce and other organizations interested in the national welfare.

"3. To provide such information as is outlined above in a practical and economical way and in a form suitable to ready reading and wide distribution.

"4. To give to such efforts the public confidence inherent in an organization of the prestige and standing of the American Bankers' Association."

Thus money as money openly enters the editorial field. The house organ evolves into the publication for general circulation. The trade paper becomes a magazine. Organized business no longer finds the vast number of publications that stand on their own feet and which the public looks to for information on current subjects adequate for its expressions of public opinion. The talented publicist now finds richest rewards, not through dealing with regular publications or with publishing houses, but by becoming a retained editor for a bank or for a bankers' organization or some other group that is not interested in making what it publishes or circulates in itself profitable. Likewise, the "economist" is coming to be retained by special interests to make special pleas based on so-called "economic law," just as lawyers are retained for pleading in the law courts.

These relatively new developments seriously threaten the supremacy of the newspapers as "molders of public opinion."

Then and Now

THEN—"And so it may be said," commented one newspaper back in 1860, "that Chicago's new courthouse, costing $98,000, is one of the most strongly built and beautiful public structures in the United States. Its splendid debtors' prison should be a constant reminder to the dishonest. It should be a tremendous incentive to better citizenship."

AND NOW—But in spite of the dreaded debtors' prison dishonesty continued; a larger building replaced the famous old landmark known to folks from sea to sea. It in turn has been replaced by the present imposing structure covering an entire block at Randolph and La Salle streets and housing the city hall and courthouse. Here debtors and creditors come face to face just as they did in the dim past.

The Mackenzies Finally Come Into Their Own

Concluded from page 6

tempt in which the latter were held by Sir Francis that he affected to disbelieve them capable of creating any serious disturbance. As a matter of fact, he appears to have done everything he could to encourage the people to revolt, and afterward boasted that he had laid a trap to entice Mackenzie and others into rebellion. He even went so far as to send the regular troops stationed at Toronto to Kingston, thus leaving the city, and 4,000 muskets in the city hall, entirely unguarded.

About the middle of November the first concrete plans of revolt were drawn up and adopted at a meeting of the Reform leaders at Toronto. The date of the proposed rising was fixed for Thursday, December 7. The organizing had advanced to such a stage that Mackenzie felt safe in promising between 4,000 and 5,000 men. It was agreed that the local detachments would make their way as unobtrusively as possible to Montgomery's tavern, about four miles from Toronto, on Yonge street, the principal entrance to the city from the north. Under cover of darkness, the arms in the city hall would be procured, the governor and his principal advisers captured, and a provisional government established with Dr. John Rolph, an able and responsible member of the Reform party, at its head. The convention provided for in the Declaration of July 31 would then be called, and a constitution adopted. Thanks to Sir Francis Head's audacity in sending the troops from the city, it was hoped that a bloodless revolution would be effected.

To Mackenzie was assigned the task of notifying the leaders throughout the country of the date of the proposed rising and making most of the necessary arrangements. Not having had any military experience himself, he appointed as commanders Samuel Lount, of Holland Landing, a former fellow-member of the assembly, and Captain Anthony Anderson, of Lloydtown, and arranged with Colonel Anthony Van Egmond, who had been a colonel under Napoleon, to be at Montgomery's tavern on December 7 to assume supreme command in the advance on the city.

While Mackenzie was engaged on this mission, Dr. Rolph received word—erroneous as it later proved—that arrangements were being made by the government to nip the rebellion in the bud. Unable to communicate with Mackenzie, of whose whereabouts he was in ignorance, Rolph took on himself the responsibility of sending word to Lount to be at Montgomery's tavern with his men on Monday instead of Thursday, as previously agreed.

On receipt of these instructions, Lount took counsel with Anderson and they decided to act on them. Meanwhile, Mackenzie had received word of the proposed change and, realizing that Rolph's action was a mistake, as it would be impossible in such a short time to rearrange plans already set for the seventh, he sent a messenger in all haste to Lount asking him to adhere to the original plans. But the messenger arrived too late; the men were already on the march; the die had been cast!

Although disconcerted by Dr. Rolph's unfortunate precipitancy, Mackenzie, with his characteristic intrepidity, urged Lount to proceed at once to the attack on his arrivel at the rendezvous on Monday evening in spite of the fact that he had brought only 80 or 90 men, and that they were tired and hungry from their unaccustomed march of 35 miles. But Lount and the other leaders present demurred. Rumors of extensive preparations by the government had reached them and no word had come from their friends in the city. In reality the city slept and Toronto could probably have been theirs for the taking that night.

To prevent information reaching the government, the insurgents placed a cordon across Yonge street, and during the night intercepted a Colonel Moodie, who attempted to ride through the lines. In the encounter he was mortally wounded. And John Powell, an alderman of Toronto, having been captured in a similar attempt, treacherously shot Captain Anthony Anderson in the back and escaped. Thus was the first blood spilled on both sides.

Two battles in which two men were killed followed, the final one on the date originally set for the uprising. The government forces had swelled to 1,200 and preparations were completed for an attack on the rebel position on Thursday morning.

Van Egmond, who had arrived in accordance with his agreement, placed the bulk of his forces in a wood about half a mile south of Montgomery's tavern, on the west side of Yonge street, and the remainder in the fields opposite. As the government forces approached they opened fire on the wood with grape and canister. The rebels stood their ground for a time, attempting to return the cannon fire with rifles, but the moral effect of artillery was too much for the untrained farmers. When the second loyalist column came up and took them in the flank, the rebel forces melted away. The affair, as battles go, was nothing more than a skirmish; and only one man was killed.

Sir Francis Head ordered Montgomery's tavern to be burned as a mark of "stern vengeance" and offered a reward of £1,000 for the capture of Mackenzie, with lesser amounts for the other leaders.

Mackenzie escaped to the United States. Dr. Rolph also was successful in getting clear. Van Egmond was captured and died in jail while awaiting trial. Lount and another rebel leader, Peter Matthews, were captured and paid the penalty of failure on the scaffold. Those who had taken a lesser part in the affair were pardoned.

In Buffalo, Mackenzie aroused a great deal of sympathy for the Reformers' cause, and succeeded in raising both money and men for a further attempt at insurrection. As the neutrality laws of the United States precluded his conducting operations while on American territory, he established a base of operations on Navy Island, above Niagara Falls, where a provisional government was set up and a force of several hundred men was concentrated, but the government troops were able to shell the island from the shore and the rebels were compelled to disperse.

After the Navy Island venture, Mackenzie made various other attempts to organize expeditions against Canada, and as a result of such activities spent 11 months in jail in Rochester, New York, for offenses against the neutrality laws of the country. In 1849 he took advantage of the Amnesty Bill and returned to Canada.

In the meantime, the rebellion which he had organized had not been in vain, in so far as Canada was concerned. The British Government, with memories of 1776 still fresh, sent Lord Durham to the colonies with instructions to make a full investigation into their political condition and to suggest necessary reforms. This he did, with the result that Upper and Lower Canada were united and the principle of responsible government, for which Mackenzie had fought, eventually established. Thus in a measure it was a new Canada to which the exile returned. He died August 28, 1861.

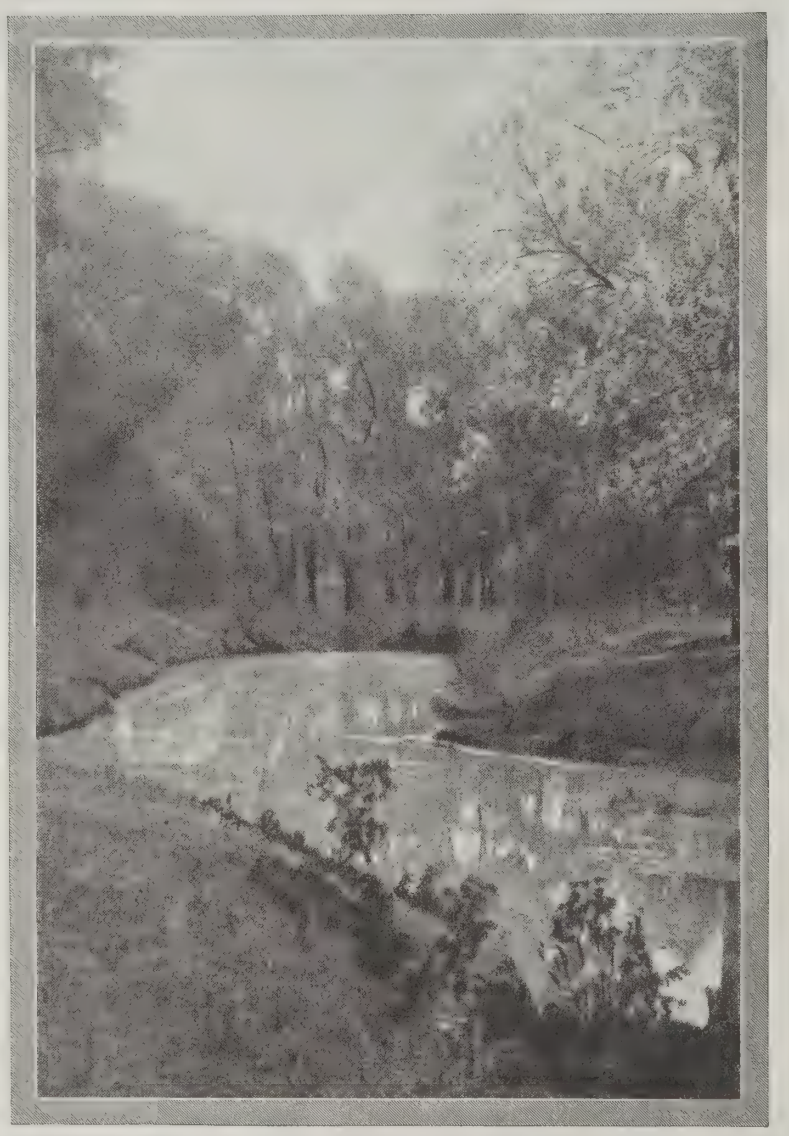
Vast Forest Preserves at Chicago's Doors

City Has 20,000 Acres of Wooded Territory for Public Recreation; Lands Conserved in Native State as Park Area for the People

By ROBERT H. MOULTON

THE name Chicago suggests to most persons who have never seen the city, and even to the casual visitor, merely a huge industrial giant, a mighty pulsating business center of nearly 3,000,000 people. They have seen or heard of its steel mills and factories, its stockyards, its intricate network of railroads, but the idea that it enjoys the luxury of natural surroundings, of woodlands and forest streams at its very door, never presents itself. As a matter of fact, Chicago possesses one of the most remarkable systems of forest preserves of any city in the world. Twenty thousand acres of as beautiful wooded territory as can be found anywhere comprise these preserves at the present time, an area which will be increased to twice that acreage in the near future.

Far-seeing men and women of Chicago have looked ahead to the time when large areas for public recreation will be difficult to obtain. They, therefore, started a movement many years ago to acquire outer park areas for their city. In working out the plan of Chicago, a vast scheme of civic improvement, which eventually will involve an outlay of approximately $250,000,000, cognizance was taken of the fact that, next to convenience and orderliness in street arrangements, the most essential thing in a great city is a sufficient park area.



It also was realized that modern cities must not confine their park land projects to their own limits, but must go beyond them and out into the open country to provide recreation areas for their people. Every European capital has its forest parks outside its limits, but within easy reach of its people. Thus in summer, London, Paris, Berlin and Vienna are on Sundays deserted by their millions, the people dispersing to the open park lands and the forests set aside for their use and enjoyment forever. In this country other cities, notably New York in its acquirement of the picturesque country along the Hudson River, are acquiring outer territory for park purposes. The people of Chicago are proud that their city has been one of the most progressive in America in the matter of forest preserves.

In 1904 a body known as the Metropolitan Park Commission was appointed. It made a report in favor of acquiring between 35,000 and 40,000 acres of forest parks encircling the city. The commission wanted forest land conserved in its native state for the benefit of the people. Its recommendations were used as the basis for the forest preserve feature of the "Plan of Chicago." In 1913, as a result of years of effort and agitation, the legislature of Illinois passed a forest preserve bill. The bill authorizes county commissioners to become forest preserve district commissioners. The law provides for the taking of private land for forest preserves to be acquired and maintained for the benefit of the people. In 1914, by a vote of the people, all of Cook County, in which Chicago is located, became a forest preserve district. The next year, the forest preserve district of Cook County was formally organized and steps taken for the purchase of available sites.

The plan by which the forest preserve commissioners of Cook County are working will preserve for the city five large outlying parks. The tracts which will form these preserves all lie within the western half of a circle, the eastern half of which would be covered by Lake Michigan. With the intended lake front improvement, they will leave no quarter of the city far from open space and access to the beauties of nature.

Even when the city has grown to envelop these several preserves, they will still guarantee it in perpetuity a rich domain for normal acquaintance and contact with woods and streams and the life that inhabits them. The purpose is to keep them for the most part in a state of actual wilderness, concentrating the necessary buildings, ball grounds, playground appliances, and other artificial improvements in limited areas set apart for such things. Reforestation as well as preservation will be considered. With this in view, one nursery with 600,000 seedling trees has already been established on the Des Plaines River.

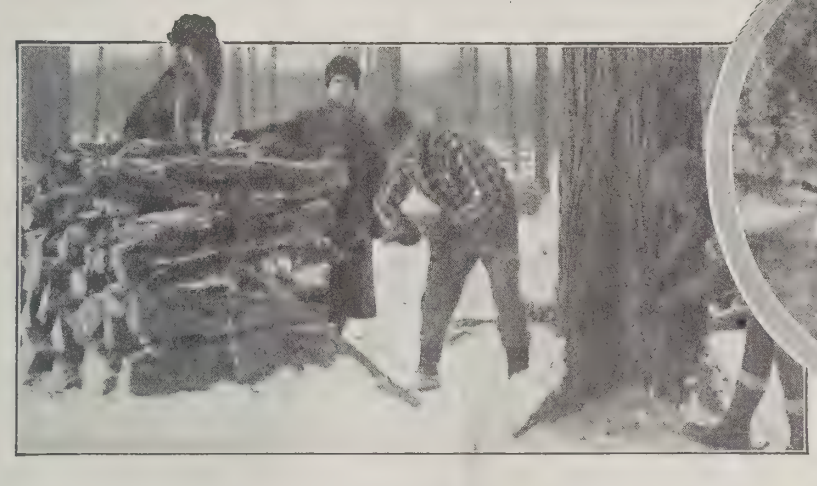
The 20,000 acres of forest preserve in Cook County were acquired within the last seven years at a cost of more than $8,000,000. They form a perfect chain of woodland around Chicago. It is predicted that some day they will form a world marvel of a public recreation place, as well as an economic life belt for the community. In connection with the development of the forest preserve system, there also is going forward the construction of a system of concrete highways, which have become known as "county boulevards," to connect up the various preserves.

Small running streams and lakes, beautifully shaded by many varieties of trees, are common in Chicago's forest preserves.

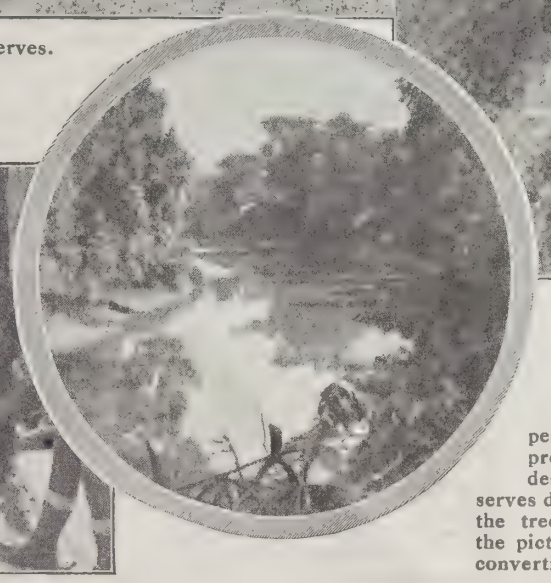
For the camper and seeker of health, and for rest and recreation, Chicago's forest preserves present unrivaled opportunities for outdoor life and enjoyment. During the last two years it has not been unusual for 100,000 persons to visit the preserves on a holiday. More than 3,115,000 persons visited the 20,000 acres of the forest preserves during the eight months from April to November, inclusive, of last year. Roads and trails, many of which were opened generations ago by the Indians, run in every direction in all the tracts. Traced and marked by signs erected by the district's forest rangers, these trails make the forest as accessible today as they were to the Indians.

In each preserve there are innumerable secluded spots along the banks of streams and at the edge of lakes where camps may be pitched, a privilege free to all, the only requirement being that campers notify the caretakers of their plans and that they observe the rules, which are similar to those in our national parks. Topographical maps of the forests enable visitors to select just the type of forest they are seeking. At the same time a complete index to animal life and wild flower growth is available. By a simple reference one can establish the exact character of each of the 20,000 acres at present constituting the forest preserves. In the same way the course of streams and the location of lakes, both of which abound in the district, are made clear.

A specimen of the existing Chicago preserves is found in 1,200 acres of hilly woodland in the so-called Deer Grove tract, 25 miles northwest of Chicago. Here are native groves of shagbark hickory, which are said to be unsurpassed in the United States; old Indian trails, still following their immemorial courses; a small herd of deer roaming over 850 acres, a flock of 500 sheep, running streams, and lakes of clear water in which fishermen find their zeal rewarded and to which the blue heron and the bittern resort. Wild ducks come in abundance. Song birds abound. The variety of shrubs and wild flowers is extraordinary. For the special accommodation of poor children there is admirable camp equipment at one end of the preserve. There are bunk houses, a cook house and a dining room, an ice house, an athletic field, and boating facilities adequate for the demands of 400 or 500 boys and girls. There also is an emergency hospital.



In a degree this preserve is representative of all the others, though each has its distinguishing features; virgin forests of oak, maple and other hard woods, which make a refuge for bird life; old Indian burying grounds marked by quaint stones; the ruins of several French forts; range after range of ravines, hills, cliffs and other native charms, preserved in all their native wildness. Golf courses are now being constructed at some of the preserves.



Among the plans for the future are an arboretum, designed to be the greatest in the world, which will include every species of tree and shrub that can be grown in the latitude, and a zoological garden, which will be unique among similar institutions throughout the world. The zoo, as planned, will cover a 300-acre site and will give the impression of all sorts of wild animals roaming at will in their natural surroundings, for cages, bars and chains will be replaced by more modern means of restraint, or will be so cleverly camouflaged that the animals will seem unhindered. Thus, the visitor may observe lions apparently ambling about at large or springing from ledge to ledge of rock-walled ravines; tigers prowling amid stony pits or tropical verdure; polar bears in rocky backgrounds with ample pools of water. Animals will be confined by shelving arrangements of rocks which, although wholly invisible to the spectator, will effectually keep them within bounds. The zoo, it is expected, will be divided into five sections, with a ridge skirting all the exhibits, so that a panoramic view of every animal is offered to the spectators as they enter the garden. The five divisions will be tiered, with the last one, holding mountain lions, mountain goats, chamois and similar animals, towering mountain-like as a background. Forest preserves find their justification in the growth of a timber supply for the future, the maintenance of water supply, the favorable modification of climate and the recreative uses that they serve for dwellers in the cities. This last is foremost in the Chicago program and in a purely economic way is of the highest importance. Even commercial supremacy, if it were an end in itself, depends on the comfort, health and happiness of the people. The highest social standard set for itself by any city in the matter of parks is one acre for each hundred inhabitants. This is the standard set by Berlin, also by Los Angeles, in the laying out of their notable park development. This standard will, it is hoped by the city authorities, be surpassed by Chicago in the near future.

Magnificent trees like this are plentiful in Chicago's forest preserves.

Above is a view of an old Indian trail that winds through one of Chicago's forest preserves. The oval is a scene along the Des Plaines River, which flows on its peaceful way through a Chicago forest preserve. At the left is shown how dead trees are salvaged in the preserves during the winter. The men sawing the tree look like real lumberjacks, but the picture would indicate that they are converting the dead trees into firewood.

Round-head Influence Blights American Letters

Concluded from page 10

stance, dull, atrophied, futile in their poor aspirations, miserable victims. Their resemblance to the fatalistic Slav is significant. They would be effective as foils. There is no class so contemptible that it should be ignored by the biographical novelist. But it is too much like a portent of dissolution that worthy and conscientious authors should be afflicted with an intellectual myopia that permits them to be fascinated by the mean and spurious alone, and that the public should welcome their deductions as gospel truth.

Take "Zell," for instance. The hero and his sister possessed both intelligence and ambition and were wholly dissatisfied with their material restrictions; capable, as the author portrayed them in the earlier chapters, of making an honorable success of their lives—if only! But their attempts to escape were feeble and tentative. Initiative, the hall mark of the race to which they presumably belonged, was entirely lacking, although to the young, healthy, and intelligent of the old stock, all things are possible. They were dismal failures. Although bred in a climate favorable to Nordics they acted like southern "crackers." If the author had known anything of anthropology he would have uprooted and sent them forth into the great world in search of fortune. Moreover, one purpose of fiction is to show the way, not merely to report . . . .

Sinclair Lewis missed a great opportunity. If he had read, with the intelligence that is his, "The Passing of the Great Race" (published first in 1916), he would have made a notable contribution to American letters, not a passing sensation. Instead of confining his attention and his formidable industry to brachycephali, he would have gone into training for mastership in fiction by portraying the struggle of the Nordic to survive the Alpine inundation. He has been taken to task for portraying only the "bad" and ignoring the "good" in his "typical" little community. But that is far from the point. The Nordics are no angels. When nature so richly endowed them she omitted perfection from their make-up. They have made the great dramas of history and in them they have played the great dramatic rôles, but they have shown all the ruthlessness of their mighty gifts and a considerable number of weaknesses to boot. Nevertheless, those that are periodically invigorated by the rigors of a northern winter will continue, unless exterminated, to prove their pre-eminence of race (heredity) over environment, no matter how choked that environment may be with round-heads; preserve their adventurous and dominating spirit, cultivate their minds, and, in this country, not yield an iota of their Americanism. The more pessimistic the author the more careful he should be to recognize the Nordic element in his scene, however his perturbed spirit may crowd it with Alpines. Then, whatever his pessimism, inevitably the Nordics would force his hand; even if he revenged himself by making villains of them. To raise round-heads—forever doomed by nature to inferiority—to the dignity of predominance, shows not only a total lack of values and a blindness of one eye but some weakness in the author's own Americanism.

Madison Grant points out that all the adventurous spirits of this country have been Nordics. It was Nordics, however humble of circumstance, who deserted their sterile farms and opened up the great west. "In the Northwest and in Alaska in the days of the gold rush it was in the mining camps a matter of comment if a man turned up with dark eyes, so universal were blue and gray eyes among the pioneers." The same was true of the California Forty-niners and of the thousands of emigrants who followed them to improve their fortunes.

And yet Charles Norris in all the portentous length of "Brass" does not introduce one Nordic. (To be sure he is not a Californian). His characters, whatever his intention, were Alpines and degenerated Mediterraneans; although Nordics, in two-thirds of California at least, flourish like the green bay tree. The streets of San Francisco swarm with them, descendants of the venturesome spirits who founded the city; and it was Americans of this old stock that created the other cities and towns in California before the South was swamped by the Middle West. But Mr. Norris was carried away by a passing fashion, the demand of embittered youth for another public expression of its own displeasure. His hero was really a Nordic, but, unfortunately, Mr. Norris did not guess it, and so missed *his* opportunity.

Mr. Grant, in his book, predicted the defeat of Germany upon the entrance of the United States into the war, owing to the fact that it could not stand up against another Nordic army. Although it is safe to say that only Nordics enlisted, the draft caught all eligibles of the other races and, worse luck, many of them were made officers. The generals, however, and the West Point officers were Nordics. Otherwise we should have lost the war, for Nordics have inherited throughout thousands of years not only the warrior genius but the necessary sense of discipline. The best of the rank and file were Nordics, whose American keen sense of personal liberty may have chafed at so much sudden discipline, but who submitted to it with the minimum of grumbling and with that thoroughbred inherited military instinct that precluded any fundamental resentment. And yet Mr. Dos Passos in his story "Three Soldiers" ignores this predominant class as completely as if it had died of flu on the way over. His three characters were plain American scum. Their ignorance was abysmal. They had inherited nothing from the past but a determination to survive with the least possible effort and risk, and were as little capable of enduring discipline as of administering it. There was not a ray of intelligence nor an ideal among them. It does not seem to have occurred to Mr. Dos Passos nor to his admirers that if his book had been a truthful picture of our army we should be German subjects today. However, judging from his name, it is possible that his bias is a matter of complexion and that if he ever heard of the Nordic race he honors it with a resentful hatred. At all events we have the antidote in "The Wasted Generation." . . . .

UNIV OF ILLINOIS URBANA ILL

BRIEFLY TOLD

There are three distinct parties in the Canadian House for the first time in the history of the Dominion. They are the Progressives, the Conservatives and the Independents.

The wooden brigantine Essex, the flagship of the American fleet which broke up the slave trade on the west coast of Africa, is to be stripped of its engines and beached at Duluth as an armory and station ship for Minnesota naval reserves.

Senators and Congressmen were assigned experts by the Treasury Department to help them with their income tax returns.

After lying exposed to the weather in the mountains of British Columbia for 10 years, a gold watch was found recently by a mountain climber and restored to its owner, who declares it to be running and keeping perfect time.

A deputy police commissioner of New York City believes that unless street traffic is to be allowed to choke itself to death, a deadline will have to be drawn in Manhattan at Fulton street, and automobiles forbidden to go south of the post office. He also recommends that horses be barred from the city after 1925 and that the Sixth avenue "L" road be turned into an automobile highway with motor bus service.

The foot and mouth disease is threatening not only the cattle of England but other animals as well. More than 20,000 cattle already have been slaughtered or have died, according to estimates.

The Hydrographic Office of the Navy Department frequently receives several "bottle papers" picked up at sea by vessels. These bottle manuscripts contain interesting and valuable data to the marine map workers sent out by the Navy Department. These bottle papers are dropped in all seas to determine the flow of the sea currents. They are printed in nine languages and contain the name of the "dropper," the ship, the date and the ship's position. The finder signs his name and forwards the paper to the Hydrographic Office.

American-born children of Japanese parents, even though the parents were natives of Japan and never have been American citizens, may own, buy and sell land in California, according to a recent decision made by a superior court judge in California. However, the father may not advance the purchase price of the land for the benefit of his children who are minors.

Twenty-one members of the League of Nations have failed to pay their subscriptions for 1921, according to an announcement in the English House of Commons.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

The town council of Hammonton, New Jersey, has discovered $2,000 in the town treasury with no evidence as to how it got there. The council is going to hire an auditor to investigate the situation, as the treasurer cannot discover any reason for the surplus.

France spends more than 1,000,000 francs yearly for United States chewing gum.

A sand deposit containing zirconium and titanium has been discovered in Florida. Titanium is a white pigment used in certain paints. Zircon silicate is a refractory substance, which is exceptionally well adapted for laboratory apparatus, electric porcelain, spark plugs, and so on. It does not shrink or expand in cold or heat and is not affected by acids and alkaloids.

Fifteen thousand persons paid a shilling each for the privilege of viewing Princess Mary's wedding presents. The proceeds will go to charity.

A tusked wild boar ended a football match at Besancon, Switzerland, when it charged the players in the midst of a game. After running wildly about the field it was shot by a gendarme. The boar weighed 120 pounds and was later served to the players and their guests at a banquet. The game was declared a draw.

A ton and a half of stone taken from Culebra Cut of the Panama Canal is to be erected as a monument over Theodore Roosevelt's grave at Oyster Bay.

The mayor of Breslau has decided to erect a monument as a constant reminder to the Germans of the loss of Upper Silesia, according to reports.

Kings or emperors have ruled India only twice in its history.

The ruins of ancient Carthage are soon to be dug up by a Franco-American archeological expedition. The remains of the three earliest Christian churches, which lie beneath many feet of dust and debris, will soon be uncovered and the finds, it is believed, will be more important as far as the history of early Christianity is concerned, than are those of Rome or Constantinople.

The Chinese are developing a liking for American cosmetics. Highly perfumed toilet waters for washing the hair are being imported into China and the cheap face creams, soaps and powders of the domestic variety are giving way to the better imported products of this class.

Four men were recently baptized in the Panama Canal. So far as is known, this is the first time in its history the canal was used for this purpose.

The American embassy in Brussels, Belgium, is to be moved to new quarters on the second floor of a building which is used as a commercial establishment.

A five-room house has been turned over to the Carl Schurz school of Chicago, and the girls attending this school will know how to care for it from top to bottom. Mondays they will occupy the kitchen, learning how to cook. Tuesday is sewing day and Wednesday the house is to be scrubbed from cellar to attic. Thursdays they will wash clothes and iron them and Fridays the girls will have a course in millinery.

There are no restrictions of the work hours of adults in Japan.

The Hungarian Government has several thousand acres of land to sell and is going to set up a bureau in America, where Hungarians will be able to purchase farms before returning home. The land reverted to the government when the taxes were unpaid, and it is planned to sell it to Hungarians who are now in America, whose savings average about $400 to $500 each.

There are more than 300,000,000 inhabitants in India, of whom more than 220,000,000 are Hindus and 60,000,000 are Mohammedans, the remainder belonging to minor tribes.

Birds that build their nests on the arms of telegraph poles of the all-American cables on the land section between Valparaiso and Buenos Aires are causing short circuits, frequently delaying messages. Mud and discarded telegraph and fence wire are built into the nests of the larger species of birds, causing disaster to communications.

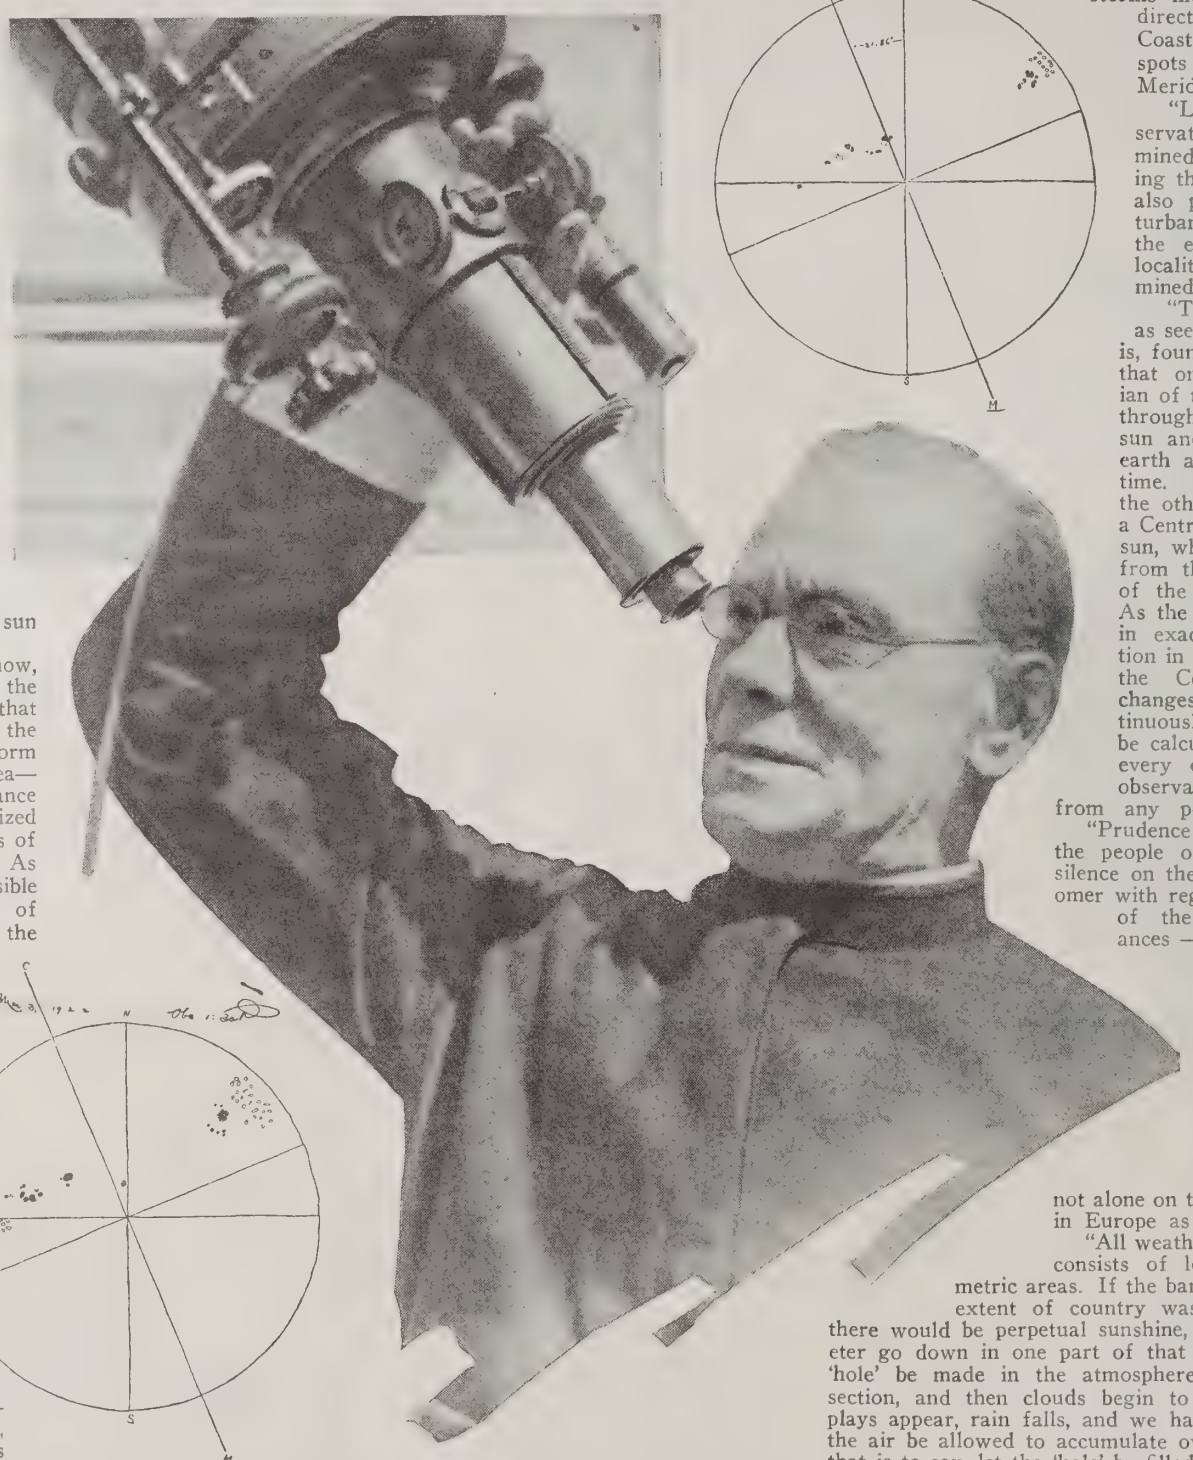
Sun Causes Earth's Storms

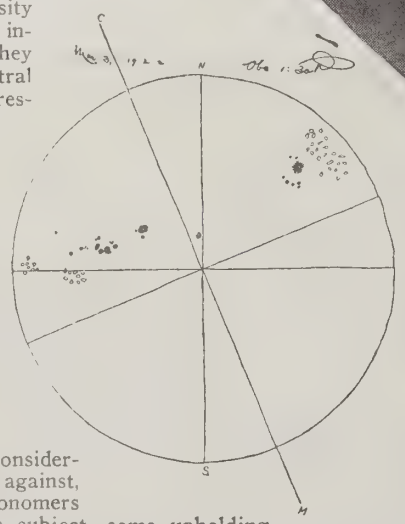
Source of Disturbances on All Planets Discovered

Chronicler of the Neglected Truth

Monster Maelstroms on Sun Cause Storms



Source of Disturbances on All Planets of Our Solar System Discovered



By HARRY H. DUNN

TREMENDOUS cyclonic outbursts, coming from the depths of the sun, and breaking through the atmosphere of metallic vapor, which surrounds the central body of our solar system, with force enough to set in motion electro-magnetic waves of such power as man has never dreamed, are responsible for every storm which sweeps the earth. Not only do these demonstrations of electric power set whirling in gigantic spiral tornadoes the 90,000,000 miles of ether which separate the earth from the sun, but they likewise cause the storms, which there is every reason to believe rage upon our satellite, the moon, and the other planets of our solar system, such as Neptune, Venus, Mercury, Uranus and the other celestial spheres.

This is the astounding discovery announced by the Rev. Fr. J. S. Ricard, head of the department of astronomy, and prominent in the department of mathematics of the University of Santa Clara, the largest Roman Catholic institution of learning in the West, and located at the city of the same name, a few miles south of San Francisco. It is the result of 2,778 observations of the sun, during 14 years, all made at the observatory at the University of Santa Clara. In addition to notes on each one of these observations, Fr. Ricard has made a map of the sun for each observation, or, rather, has compelled the sun to map its own disc by an ingenious arrangement of his own, by which he fixes a sheet of drawing paper in the same plane as the lens, or eye-piece of the telescope, thereafter focusing the telescope so that the image of the sun's face falls on this paper. Then he draws the faculae (white spots) and the sunspots (dark violet and shown as black on the map), just as they are outlined by the sun itself on the paper.

Without exception, these maps show, when compared with the records of the United States Weather Bureau, that whenever there has been a storm in the United States—that is to say, a storm of importance, covering a large area—it has been preceded by the appearance on the sun of numbers of large-sized spots, and the crossing by these spots of the Central Meridian of the sun. As these sunspots—which are the visible manifestations of vast whirlpools of electric force on the sun—approach the Central Meridian, the intensity of the storm on the earth increases. Conversely, as they move away from the Central Meridian, the force of terrestrial storms decreases. The remarkable factor in it all is that in the 14 years, during the 2,778 separate observations made, there never has been a storm in this part of the New World without its preceding sunspots, and there never has appeared a large group of sunspots, which was not followed by a storm in North America. This record seems to make conclusive Fr. Ricard's discovery, though there is considerable argument, for and against, among meteorologists, astronomers and storm observers, on the subject, some upholding Fr. Ricard's belief, and others opposing it.

REV. FR., J. S. RICARD, astronomer of the University of Santa Clara, California, at the telescope through which he has made 2,778 observations of the sun. From these observations, and the drawing of the disc of the sun which he made with each observation, Fr. Ricard brings forth the discovery that storms on the earth and on all the other planets of our solar system, are directly due to the sunspots, as they cross the Central Meridian of the sun. The drawing at the top is of the disc of the sun by Fr. Ricard, from observation at 1:25 p.m., March 2, 1922, showing the sunspots (black spots) just as they were crossing the Central Meridian (C-M). The storm on the Pacific Coast was at its height. The other drawing by Fr. Ricard, of the disc of the sun, showing faculae (white spots), and sunspots (black spots), as they appeared at 1:30 p.m., March 3, 1922. The larger body of sunspots had crossed the Central Meridian (line C-M), and there was a lull in the storm which swept the Pacific Coast at that date. The other body of sunspots, approaching the Central Meridian from the north eastern limb (edge) of the sun, however, revived the storm on the following day.

Basing his forecasts on his observations and records of sunspots, Fr. Ricard has predicted every storm which has swept the Pacific Coast in 10 years. The farmers of California, who look to his predictions with the same kind of faith with which they look for the rising of the sun each morning, call him the "Padre of the Rains," because of his almost uncanny accuracy in informing them just when to expect rain, and when not to hope for it. With these agriculturists, especially in Northern and Central California, the forecasts of the United States Weather Bureau run a bad second with the words of Fr. Ricard.

Like Thomas A. Edison, W. T. Foster and other present-day scientists, students and observers, Fr. Ricard believes that electricity is the controlling power in all life. He holds that the sun—whose mass is greater than the combined mass of all the other planets in this solar system—is a tremendous source of electricity, which, in the form of electro-magnetism, holds the planets of its system, of our system, so to speak, to itself, on their orbits, eternally rotating around it, and spinning on their own axes. The actual character and composition of sunspots is still a subject of discussion, but leading observers and astronomers, including Fr. Ricard, have determined that they are outbursts of material from within the sun, producing vast quantities of electrical energy, and showing black, or deepest purple, against the sun's blazing disc, because they bring forth large amounts of unconsumed (that is, unburned) material from the interior of the sun. That these spiral outbursts, sun-tornadoes, or whatever they may be called, which we know as sunspots, give off heat and power of a degree not even imagined by man in his greatest productions of these two forms of energy, is recognized by others than Fr. Ricard.

To get the exact data on Fr. Ricard's discovery, I sat with the pleasant little gray-haired astronomer for two hours beneath the telescope through which he has gazed for nearly 3,000 observations at the sun, and this is what he said to me, slowly and carefully, weighing his words, so that I might put it down exactly as he said it:

"There are two classes or kinds of spots on the sun—the faculae, which are bright *white* patches, seen only on the eastern and western limbs (edges) of the sun; and the permanent, or regular, sunspots, which are *deep violet,* are born in the fields of faculae, and which move across the disc (surface) of the sun. The *cause* of sunspots is largely a matter of speculation; their *character* is shown by the spectroscope to be a 'boiling up' of material from the interior of the sun; that is to say, an expulsion, an emission, an eruption, or whatever you like to call it, of unconsumed matter from the inside of the central body of our solar system.

"Sunspots in the northern hemisphere of the sun are very different from sunspots in the southern hemisphere. Both are sunspots, both groups of sunspots have the same character, but each has a very different effect on the storms, climate, and general weather conditions of the earth.

"Observation of which I have records has shown that the sunspots in the northern hemisphere of the sun on crossing the Central Meridian of the sun, provoke storms on the Pacific Coast, coming from one direction.

Contrariwise, spots on the southern hemisphere provoke storms moving in a counter-direction on the Pacific Coast, when these sunspots cross the Central Meridian.

"Long and close observation also has determined that sunspots crossing this Central Meridian, also provoke seismic disturbances somewhere on the earth, the particular locality remaining undetermined.

"The Central Meridian, as seen in projection (that is, found by calculation), is that one particular meridian of the sun which passes through the center of the sun and the center of the earth at one and the same time. Quite naturally, all the other planets also have a Central Meridian with the sun, which is quite different from the Central Meridian of the sun and the earth. As the earth is never twice in exactly the same position in space, it follows that the Central Meridian changes its position continuously, and, hence, must be calculated, not alone for every day, but for every observation of the sun made from any point on the earth.

"Prudence and the welfare of the people on the earth dictate silence on the part of the astronomer with regard to the influence of the electrical disturbances — sunspots — on the sun, over seismic disturbances on earth, but the forecasting of storms by the observation of sunspots has been reduced almost to an exact science, and repeatedly has proved its value, not alone on the Pacific Coast, but in Europe as well.

"All weather, as is well known, consists of low and high barometric areas. If the barometer over a large extent of country was always the same, there would be perpetual sunshine, but, let the barometer go down in one part of that area; that is, let a 'hole' be made in the atmosphere of one particular section, and then clouds begin to form, electric displays appear, rain falls, and we have a storm. But if the air be allowed to accumulate over that depression; that is to say, let the 'hole' be filled, and filled to overflowing, then the clouds disperse and fine weather returns once more.

"The secret of the accurate forecasting of weather and climatological conditions, then, consists in being able to tell when the low barometer is coming, which means clouds, rain, wind and a storm; and when high barometer is coming, which will mean the end of the storm and clearing, or clear, weather. The cause of bad weather, then, is the factor, whatever it may be, that makes the low barometer, and the cause of good weather, vice versa, is the factor that makes high barometer. Now, meteorologists and weather observers have learned that invariably, in an area of low barometric pressure, the winds blow spirally, or in the line of a circle, counter-clockwise, or in a direction opposite to that in which the hands of a clock move. These winds are the *local* causes of the storm, but their cause is not local; hence, we have to find, in seeking the cause of the storm, the force, power or energy which sets these winds to blowing against the clock.

"Sunspots in the northern hemisphere of the sun, are whirling disturbances in spiral form, but of such tremendous magnitude and power as to dwarf the mightiest storm man ever has known, or that has ever occurred on this earth since man appeared upon it. They, too, whirl counter-clockwise, traveling around their center with great rapidity, as do earthly hurricanes and tornadoes, and, also like the spiral storms

Closing "For Repairs" and Calling the Police

Wall Street Gets Fit of Nerves When It "Breaks on Page One"; Guards Patrol Financial District to Soothe Stock-gamblers

By CHARLES ALBERT COLLMAN

FOR the last few weeks, a gray-coated policeman has been glancing distrustfully from a narrow doorway in the marble front of the New York Stock Exchange. On the wall behind him hangs a sign:

Gallery Closed for Repairs

It means that again the public has been excluded from the building on whose trading floor is conducted the country's greatest market in securities. The financial district swarms with extra policemen, in addition to the private detectives and plain clothes men who generally guard the banking institutions. There has been a distressing sense of suspicion in the air.

The reason for all this is that Wall Street has got itself on the front pages of the newspapers. Whenever that occurs, the financial district has a fit of the nerves.

The situation is somewhat paradoxical. As a rule, men in big business don't stand in fear of their customers. Yet here is Wall Street, the country's heaviest advertiser, living in terror of the very public whom it was inviting to buy its wares.

Such was not always the case. For many years, the gallery of the Stock Exchange was one of the popular show places of New York. Rubberneck wagons stopped daily in front of the Exchange, unloading out-of-town visitors, who trooped up to the mezzanine floor to watch the always interesting scene of the mob of brokers, shouting and gesticulating about the trading posts on the floor below.

But today, if a broker happens to see a strange face peering down at him from the gallery, he runs for cover. He's afraid something unpleasant is going to happen to him. You would think him engaged in some kind of work that merited public resentment.

Sign a Joke to Initiated

SINCE the Stock Exchange was built, probably there never was a time when its gallery needed repairs. But when a scare is thrown into the brokers, *they hang out the timeworn old sign that has done duty in emergencies since long before the old panic of May, 1901.* This little fiction is a joke to the initiated in the street. And the newspapers considerately refrain from comment.

The occasion for Wall Street's jangled nerves is that more than 40 commission houses closed their doors in the financial district within a month. Many persons complained to the District Attorney's office that they had been duped. They were unable to get the stock certificates they had bought through their brokers.

The trick that had been pulled off is known in the parlance of the street as "selling your customers short." A man walks into a broker's office, plants down $1,000 and orders the purchase of 100 shares of stock. The broker takes the order and the money, but instead of buying the stock, he secretly sells 100 shares short.

To some persons it may seem inconceivable that a broker should deliberately wish to see his customer lose. Besides, how would this profit the broker? The explanation is quite simple.

When prices are low, the public rarely pays any attention to the market, it being under the impression that then "there is no money in stocks." However, this is just the time when pool operators buy up blocks of securities on margin, and gradually work the market up. But it is impossible for the pools to make money from one another. They industriously spread the cheerful tidings that the market is on the verge of a boom, and that there is going to be "big money in stocks." The "million share days" arrive. When prices are from 10 to 20 points higher, the public has been tempted to come in. Then the pools unload upon the public, and the market breaks.

Expect Public to Bear Losses

NOW the trained broker knows instinctively that the psychological moment has arrived, when he sees his offices suddenly filled with a fresh crop of inexperienced customers. Confident, with the wisdom based on long experience, he knows that these persons are going to be fed up with securities at the highest prices, and that the quotations will then break. It makes him regretful to see this good money going to waste. And this is what he does.

A customer has instructed his broker to buy 100 shares of an issue selling at say $113 a share. The broker sells the stock short. Eventually it declines to $97. Having cleaned up a profit for himself of $1,600, the broker now buys back the stock at 97 and sells it to his customer for 113. The commission man has thus netted a profit of $3,200 on the round transaction, and yet he has delivered the stock which his customer bought.

In justice to the New York Stock Exchange, it must be observed that its rules make this practice of bucketing a capital offense. When a member is detected in it, his punishment is expulsion. And of the 40 or so brokerage houses that closed their doors, only three were members of the Stock Exchange. Others were identified with the lesser exchanges, but by far the greater number had no representation on any board, but were made up of the members of that race whose destiny it is to prey upon other races, most of them being men of no standing, some of them ex-convicts and ex-bankrupts, and operating under assumed names.

Perhaps the public had at last learned wisdom, or perhaps this time it had been fleeced too boldly. At any rate, there arose a sudden and general demand from persons in all quarters of the United States for the stocks they had bought through Wall Street houses. Customers who were paying for them by installments, or were holding them on margins, unexpectedly paid up balances and asked for their certificates. The dishonest brokers were in a bad fix. They faced criminal prosecution if they failed to deliver the goods they had sold. They either had to suffer heavy losses by buying back their short commitments, or go into bankruptcy. As we have seen, most of them chose the latter course. Thirteen, who had been indicted, fled the city.

It was amusing to hear many of these so-called brokers squeal. The merchant who sells his goods does not object to deliver them to his patrons. But the "bucketeers" considered it most unreasonable that their customers should demand what they had paid for.

In all this miserable record of swindling, very little of the blame could be laid at the door of the New York Stock Exchange. But the subsequent actions of its officials brought upon them the severest criticism. New York's district attorney, Joab H. Banton, went to Albany and asked for the immediate enactment of a "blue sky" law, and provision for the licensing of brokers and the periodical inspection of their business. It was considered that New York should be the leader in this movement, because at least 50 per cent of the financial parasites maintain offices in the Metropolis, due to its importance as the financial center of the country, if not of the world. Mr. Banton's efforts were frustrated. Seymour L. Cromwell, president of the New York Stock Exchange, exerted the whole influence and power of that body to defeat the laws intended to protect the public.

It is true that the best element in Wall Street strongly objects to the "bucketeers," not necessarily because it sympathizes with the victims of fraud, but because the discreditable interlopers invade the financial district to poach upon its preserves. The brokers feel that all this money obtained by swindlers should have gone into "legitimate channels."

This attitude of the Stock Exchange and the banking houses is based upon the fundamental principle of the street that *the public is entitled to lose.* Wall Street men may protest this, but it can be proved against them by the confidential circulars issued for the last few months by banking and Stock Exchange houses of the highest standing. Every Saturday, these circulars have contained this private information to their patrons: *"We continue to advise the purchase of securities. No reaction in prices can be expected, because the public has not yet entered the market."*

The Financing of Railroads

THIS principle holds good in the most eminent banking circles, as may be shown by the treatment of public holdings in the securities of the Denver & Rio Grande Railroad at the present time. A previous article has described the predicament in which the Denver road found itself some years ago. Winding over the state of Colorado, with a main line from Denver to Ogden, Utah, this railway, some 2,600 miles in extent, had enjoyed a satisfactory share in the traffic to and from California. Suddenly competitive interests obtained control of the California trunk lines, and bottled up the Denver road in Utah. Through the sheer pressure of circumstances, the railway was now compelled to build its own extension to the Pacific Coast. Under the supervision of its president, Edward T. Jeffery, the gigantic work was begun of extending the Denver line 1,000 miles across deserts and through the rocky fastnesses of the Sierras to San Francisco Bay. This phenomenal task was accomplished against unheard-of odds in a struggle with natural and human forces. Within the limit of about four years, there was completed one of the most remarkable engineering achievements of the country.

The builders of the Western Pacific extension were called upon to make exceptional sacrifices. The Denver road's credit was good, and its stocks were popular. The common sold as high as $53 and the preferred up to $103 a share. The latter had paid dividends of five per cent over a long period of years. The Denver road had borrowed $50,000,000, which was placed as a first mortgage upon the new Western Pacific line. All the surplus resources of the Denver & Rio Grande were used in the new construction work. This proved more costly than was anticipated, due more especially to the vast tunnelling operations through the mountains. At last even the dividend on the Denver's preferred stock was passed, in the effort to devote every dollar to the work toward the Pacific coast. All these economies were cheerfully borne by the stockholders, who were willing to wait for the greater gains in the vast promise of traffic with California and the Orient.

Finally, the Western Pacific was completed, and its through trains had begun crawling through the passes of the Sierras, when suddenly a storm broke loose in Wall Street which threatened the ownership of the new line. Banking groups, greedy to wrest it from its builders, began to battle for the road's possession. It is needless to comment upon the identity of these groups, although the country might be somewhat amazed to learn of the part played in the contest by the members of one of its wealthiest families.

This battle of bankers was fought under the cover of great financial institutions, such as the Equitable Trust Company—whose actions in this affair did not exactly exemplify a sense of equity—and the Farmers' Loan & Trust Company, which, despite its name, probably never trusts a farmer for a dollar—meaning, however, no disrespect to this old institution, which ranks among the finest of its kind. However, to the initiated, financial concerns so named represent merely certain groups of capitalists.

In the struggle for the possession of the Denver & Rio Grande and the Western Pacific, there were no evidences of fraud and criminality such as were laid bare in the financial operations of the Missouri, Kansas & Texas. The bankers concerned here were of a more reputable type. And on their own behalf they will protest that every step they took in divorcing the Western Pacific and later the Denver & Rio Grande from their owners was perfectly legal. In this defense they will be justified. Each move in the great game was approved by the highest courts—but the game itself is a record of selfish greed, callousness, rapacity and utter disregard of private and public property rights. Its unexpected outcome stands without parallel in our railroad annals.

Fight Made "Under Cover"

IN BORROWING its $50,000,000, harsh terms had been imposed upon the Denver road by Wall Street's financiers. The Denver & Rio Grande was pledged to make up semi-annually any deficit in the earnings of the Western Pacific in the amount required to meet the latter's operating and maintenance expenses and taxes, and interest on the first mortgage bonds. We have seen how it struggled to meet these conditions, first by utilizing its surplus earnings and then the sums formerly laid aside for the dividend on its preferred shares. Nevertheless, it was unable to meet the bond interest due March 1, 1915. Now suddenly it found itself in the grip of the money-lenders.

In constructing the Western Pacific, the Denver road had accomplished a great public service in making possible a wider development of the country's resources. Apparently, it was entitled to some consideration, in view of its extreme efforts, and the completed 1,000-mile line of its Pacific extension was certainly ample security for its loan. But all offers of compromise were bluntly rejected by the Wall Street banking group. The latter had foreseen this eventuality, and were determined to exact their pound of flesh by acquiring possession of the road.

Now, under the leadership of their corporation lawyers, the bankers entered upon well-matured plans. They were striving solely for selfish rights. They ignored the fact that they and their associates had sold millions in securities of the Denver road to public investors, savings, life and fire institutions, and that these interests possessed equities in the railway lines which should have been respected. In fact, the sales of such securities had been made upon the understanding that the future destiny of the Western Pacific lay in the hands of the Denver road.

As said before, the fight was conducted under cover, in the form of dry court proceedings, brought by fiscal institutions, in which the names of the individuals really interested never appeared. And the public, unsuspecting the dramatic climax that hinged upon the contest, paid scarcely any attention to the struggle.

On March 5, only four days after the Denver road had failed to make its interest payment, the bankers obtained through a court judgment, the appointment of a receiver for the Western Pacific. The latter property was then sold at foreclosure, and bought by a so-called "reorganization committee," representing the money-lenders. The first part of their scheme had now been accomplished successfully. They had segregated absolutely the Western Pacific from the Denver & Rio Grande, which had built it, and now the Pacific road was entirely their own.

Those Who Bought and Suffered

THE next step in the plan was to wrest the Denver & Rio Grande from its owners. The Equitable Trust Company, representing the money-lenders as trustee of the mortgage, brought suit against the Denver line, and obtained a judgment for more than $38,000,000. This decision was bitterly fought, appealed, but affirmed. Finally, the Denver & Rio Grande was also thrown into bankruptcy, and was sold at public auction for $5,000,000 to the group of bankers now owning the Western Pacific line. The Denver road was thus acquired subject to an outstanding bonded indebtedness of $120,000,000, but the common and preferred stocks, amounting to $87,779,800, were automatically wiped out of existence.

The formal transfer of the Rio Grande to the Western Pacific was made July 27, 1921. By this action, a railway 2,600 miles in extent, became the property of its own branch line, which it had constructed, and which aggregated only 1,000 miles.

Under the reorganization plan of the new owners of the Denver & Rio Grande, the values of two of the mortgage bond issues, the five per cents of 1955, and the seven per cents of 1932, were practically cut in half.

Is Your Income Tax-Exempt?

AN EXAMPLE for sharp investors and a warning to the government is easily discernible in the inventory of the estate of the late Jacob H. Schiff, of the international banking firm of Kuhn, Loeb & Company, which has just been made public.

Over two-thirds of the Schiff millions was invested in tax-exempt securities.

The Boston News Bureau, in an analysis of Mr. Schiff's financial status, said that on the assumption of an average income of four per cent on his holdings and *none from Kuhn, Loeb & Company* his income for 1920 would have been $1,025,320.

"If such an income were fully taxable," the bureau's analysis went on, "he would have paid $681,833 to the Federal Government, but the investment in tax-exempt securities reduced the tax bill to $156,360."

The largest single item of the Schiff inventory was $9,164,952 in City of New York bonds. New York long ago succumbed to the influence of the sharp financiers who demanded that the largest city be operated chiefly on a bond basis, assuring financing tribute upon all municipal improvements. Practically none of Mr. Schiff's fortune was placed in industrial quarters, nearly all being in "investment" securities, which may be defined as public bonds or bonds and stocks of such private enterprises as have long since passed from the hands of the risk-taking developers to the control of those who demand assured dividends.

Mr. Schiff's policy in placing none of his money in the wildcat bond and stock issues which bankers are eager to float *but not to buy for themselves* is a wise one for investors to follow.

The magnitude of the loss to the government from tax-exemptions should be a sound warning. It should be the duty of the government to make such simple tax laws that the person of small income shall be amply protected, rather than to enact measures filled with exceptions and provisos, designed to tempt the cupidity of tax-dodgers who are wealthy enough to hire great staffs of lawyers and experts to take advantages which the man of small income must miss.

Threatening an Empire

BRITISH opinion seems to be in doubt as to whether the cause of the Empire in India has been harmed more by the non-co-operationist agitation of Mahatma Gandhi and his followers, or by the Montagu-Reading administration to whose hands the British Government unwisely confided the turbulent peninsula.

The publication of the now famous Delhi *Telegram* caused the immediate downfall of Mr. Montagu, secretary of state for India, and doomed the continuance of the rule as Viceroy of India of Rufus Isaacs, Lord Reading. Comment in England and elsewhere has been bitter over the incident, criticism of the Reading-Montagu régime ranging from the comparatively mild charge of "ineptness" to accusations of downright disloyalty.

The telegram was sent by the government of India (which Lord Reading heads) to Mr. Montagu. It urged the revision of the Sevres Treaty between Turkey and the Allies, to provide for the evacuation of Constantinople, the restoration of the sovereignty of the Sultan over the Holy Places, and of Turk power in Thrace, Adrianople and Smyrna.

The professed idea of the advice was to calm the Moslem unrest in India. Hindus outnumber the Moslems in India three to one.

The Indian Government asked permission of Mr. Montagu to make public its telegram. This permission was granted with suspicious promptness, the secretary for India cabling consent without consultation with Premier David Lloyd George. The publication, of course, brought an immediate demand for his resignation, announcement of which stirred the staid House of Commons to an unusual burst of applause.

The prime minister's letter to Montagu pointed out that the demands made for relieving unrest in India involved considerations extending far beyond the borders of that state. The concessions asked for Turkey exceeded even those asked by Mustapha Kemal, the Turkish Nationalist leader. The sovereignty of the Sultan over the Holy Places would take Mecca and Medina from the Arab rule, and Jerusalem from the mandatory hands of Sir Herbert Samuel, events which would have stirred the wrath of the Arabs whose traditional control over the cities of Mohammed dates from the Prophet's day, and of the Jews whose new ascendancy over the city of the Holy Sepulchre has merely whetted their appetite for power. The suggestions for changes in control in Smyrna, Thrace and Adrianople, vitally affect the interest of nearly all the nations in the Near East.

The little 200-word telegram from the Indian Government, harmless enough without publication, was packed chock-full of wars, uprisings, revolutions.

Opinion in Great Britain is deeply pessimistic over the situation in India. Comparative good order and contentment existed in 1917 when Montagu was appointed but the five years since especially the recent period since Reading became Viceroy have been characterized by phenomenal growth of unrest. The fall of Montagu brought an expression of regret in only one quarter—from the non-co-operationists in India.

The British Empire, if it is to continue, must not commit its far-flung possessions to the Readings and the Samuels and the Monds and the Montagus of international politics.

Take the $ Mark Away

THE coming of springtime is heralded again by the extravagant press agenting of the vast industry of baseball.

From one end of the country to the other, the leading newspapers are giving columns of free space to the publication of articles designed to lull the suspicions and arouse the interest of the baseball public, so the private pocketbooks of owners of baseball teams may be lined again. Persons acquainted with the operation of the press would never accuse newspapers of being eleomosynary institutions; yet every year the great newspapers give free millions of dollars worth of advertising space to professional baseball, while the amateur games, in which boys and men play on the sand-lots after school and work, receives a scant line or no attention at all.

Professional baseball is a cold, hard business, in which the players are workingmen, compelled to labor daily at a routine employment, bound by fast rules, enforced by hard taskmasters, and hired by men who cast aside aged young men with a ruthlessness no other private employer would dare to exercise.

School and sand-lot baseball, on the other hand, has the right to be known as America's national game. It is inspired by youth's natural ambition and energy and dedicated to health and sportsmanship.

Athletic sports have had their highest development in America. But here, too, they have been capitalized in the most vicious manner. It is time to take the dollar sign off.

The Easy Way

WE ARE subject to an optical illusion in that if a black and a white object are exactly the same size, the white will appear larger to us. We are subject to a similar illusion regarding truth. All facts which seem to bear out our preconceptions are white to us, and seem of more importance than opposing facts.

It is easier—

> to accommodate conscience to habits than habits to conscience; to find some plausible explanation for what we believe and do than to criticize ourselves with rigorous honesty; to let prejudice deal with opposing ideas than to examine impartially into their merits; to buttress old beliefs with near-arguments than to follow cold logic into a change of belief; to recognize a fact which seems to confirm our preconceptions than to see a disproving fact; to yield to what appeals to our emotions than to yield to cold logic.

If it is easier for us to fortify ourselves in our errors than to search honestly for truth, is it the better way? Is it as well for us to cling to our beliefs (as though they were ultimate knowledge) as it would be for us one and all to acknowledge our ignorance and keep the mind open for *all* new truth, from new truth, from whatever source, and however revolutionary?

The latter might be the more rational, but perhaps is not humanly possible. We are built rather on the plan of conserving prejudices. The most radical of us are conservative.

Well, We've Been Pretty Busy

RESIDENTS of the United States have alway been prompt in their expressions of ange over the mis-government of persons in other lands Korean oppression, Chinese exploitation, Irish suffer ing, Spanish misrule in Cuba and Armenian massacres are only a few of the things wrong with the worl which have drawn vigorous denunciation in thi country.

But for nearly a year, protests with ever-increasing force have been coming from Porto Rico over Amer ican misgovernment. Since the American Marines an a New York City bank took over the control of Hayti there has been a steady stream of charges that th natives of that republic have been made the victim of military and financial oppression.

There has been a mild investigation of the Haytian affair, but no clear-cut understanding of the situation has been brought home to the public. As for Porto Rico, the island's resident commissioner in Congress has talked himself hoarse in trying to get an inquiry a San Juan grand jury has returned an indictment of the American governor, and many articles setting forth the accusations against American management have been dispatched to American newspapers. But Congress yawned and took no action, the United States judge would not accept the grand jury's indictment, and it was a dull day for news when the American newspapers found even a little space in an obscure position for Porto Rico.

It is difficult for us to believe anything can be seriously wrong with the government we donate to others. We are doubtless quite right in taking with a grain of salt the charges made against the officials we have kindly let our island wards take. But it seems rather funny that we never thought of that grain of salt when we were listening with open-mouthed horror to wildest tales of massacres in Kiev, of starvation in India, of outrages in Korea and Armenia.

There may be little or nothing to the charges made against American rule. But it is time self-respect on the part of Congress compelled a complete inquiry of the conditions in Porto Rico.

The great trouble with Porto Rico seems to have been the lack of a good, experienced propagandist bureau in the United States, with suave and capable mixers in charge of the New York and Washington offices. All the poverty-stricken sufferers of other lands who have appealed successfully for American aid and sympathy have recognized the necessity of maintaining high-priced and efficient agencies for propaganda in this country.

Federal Reserve as a Life Buoy

IT IS only natural that a beneficiary of the Federal Reserve System should hold it in great reverence, but that it was the means of enabling this country to carry on and win the World War is rank nonsense. Yet that credit is given, and more, in an annual official bulletin recently issued.

To appreciate the full value of the opinion it must be borne in mind with what reluctance the national banks accepted the dictum of Congress in 1913 that "all national banks must and other banks may" take stock in the reserve banks created by the new act.

To the member banks is given deserved credit, in the bulletin, for distributing the Liberty bond issues, but nothing is said of the limitation of these same bonds that resulted in profit to the Reserve system and a depreciation in market value that cost many a patriotic investor a loss of 10 per cent or more when forced to sell his bonds to procure means to live after being forced out of work by the maladministration of the system.

The bulletin says in the present depression we have been saved a more serious panic than that of 1907. The panic of 1907 was of short duration and was the work of the same group of international bankers which has caused the present trouble. It was serious while it lasted, but it caused no perceptible ripple in the industrial world. Legitimate business was temporarily embarrassed, of course, but when the millions, furnished J. P. Morgan & Company from the United States Treasury by order of President Roosevelt, were loosed on the New York Stock Exchange, the panic was over. The hard times of 1920-21-22 are still with us. The panic of 1907 reduced a few stock gamblers to poverty; the deflation of 1920 has impoverished millions.

Mr. Ford's Page

THE Conference at Genoa starts out with its name against it—for Conferences have not fulfilled the expectations of the people. They never do, of course. At their very best, conferences cannot be more than preliminary and preparatory. They are points of departure rather than units of power.

Nevertheless, the Genoa Conference appears to have in its favor the fact that it realizes the need of the world to be industrial rather than political. Of course, it is a political realization of this fact. Industrial realization has been existing a long time. And besides being political, it is also financial. That is to say, the fact of Money rather than Life is uppermost. The banking pressure is felt more strongly than the human pressure. If the banking distress, by which is meant the distress of the money speculators, had existed as long as the popular distress has, the Genoa Conference would have been held long ago. Government never acts so quickly for relief as when the private financial structure is in need. Which is perfectly reasonable when it is understood how many of the government's monetary functions have been passed over the private institutions.

It is by no means certain that Genoa is going to be the comfort which the money-brokers hope. Governmental heads will attend there in very obedient mood, to be sure, their main missions being skillfully hidden by references to purely political questions with which the people are diverted. But Lloyd George's great speech of April 3 uncovers the real intent of Genoa, for even that speech emphasized the industrial side more than the financial side, as for popular consumption it was bound to do.

But it would not be a surprising thing if Lloyd George's speech should turn out after all to be quite prophetic of the turn which affairs will take. In spite of the unseen ranks of money-brokers which will be in attendance upon each national delegation (even including that of Russia) it may well be that Destiny shall turn the trick of throwing Money to the discard and taking the next step arm in arm with Industry only. It is not at all impossible that the liberation of labor and material may turn out to be a more pressing thing than the settling of ways and means for the money-changers to continue their taxation of labor and industry. Exchange for the sake of assisting industrial service between the countries is an important facility, and it ought to be put into shape at the earliest possible moment, but as a means for setting lawless tollgates upon the highways of commerce, it is not worth a moment's thought.

If the outcome of Genoa should be that the statesmen of the world, forced by the facts, shall view finance as the servant of industry and not its master, and shall evolve methods by which that service can be rendered without endangering the high interest served, then a line will have been forced through the crumbling forces of artificial finance.

Of course, this is what is coming, whether through the Genoa Conference, or some other way.

Genoa is the acknowledgment that the trouble underlying other troubles is economic. Genoa is therefore a greater fact than the conference at Washington. When the economic aspect of the world problem was broached in connection with the Washington Conference, wide opposition was offered to its being even so much as mentioned, the reason being that its introduction was supposed to have an ulterior purpose, namely, the cancellation of war debts. Our people are opposed to the cancellation of those debts until they are convinced that such a course would result in some good to the other peoples of the world. There is probably nothing that the American people would not forgive another *people* for their good, but the American people are going to forgive the international financiers nothing at all. It is part of the reform of our whole social system that the international financiers be made to drink to its last dregs the cup that they have mixed for the people.

Now, with the apparent unpopularity of the cancellation proposals—not because the American people are greedy (they are losers already and anyway) nor yet because they have any thoroughly thought-out reason against it; it is their instinct that larger issues than the mere crossing out of debts are involved—the statesmen have been forced to take one step nearer the root causes of the trouble. As one by one the makeshifts are removed, the necessity for fundamental work becomes more pressing. That is the principal significance of the Genoa Conference. It is a proof that the rulers are being forced back, step by step, by the sheer pressure of events, toward the roots of the evil.

The principle that money is the first consideration is already defeated. The principle that money is wealth is totally defeated.

But that is not all: the principle that money is unnecessary is also defeated.

The speculative financiers of Europe, who made money the superior of every other commodity, defeated their principle by running it to its absolute reduction into absurdity. The communists of Russia, who made money nothing but a printing press product, have defeated their principle by reducing it to the absurdity of the opposite extreme.

So much of the road is therefore clear. What is left is the trinity of material, labor and management—productive labor and productive brains and productive capital—with money the ready-to-hand servant of the other two.

Genoa, in the public program at least, is concerned with material and labor, and with money incidentally as the agency which can release and serve the other two. It is a sad comedown for mere money-brokers. If the statesmen are wise to see all the implications of their situation, some clearing away of the cloud may result—but no one will now make the mistake of expecting too much.

It is all a matter of seeing. And it is not so much a matter of those who do not see, as it is a matter of those who do. The mere manipulators of money, save a few exceptions, do not see at all. They do not see what is coming upon them. They do not see what the pressure of events means. But that is not at all unusual for their class. They never did see. The average dry-goods clerk knows more about the textile trades behind the goods he handles, than does the average "financier" about the monetary system behind the goods he handles. Most of them have never seen what their place was in the world, even when things were going smoothly with them. All that they saw was that they had an unusually profitable hold on the rights of other men. All that they see now is that their hold is being unfastened by an invisible force they cannot identify nor understand. Their failure to see the whole situation is not therefore surprising; they have always been blind leaders of the blind.

But there are others, a few of them manipulators of money, but most of them not, who do see. And what they see are the things that are to be, whose coming will crowd out the old false system, not with noise and terror, but slowly, silently, as health crowds out disease. The world is going along the way which the seers see. It is not going to stand still with those who cannot see—who cannot see because they will not.

PRESSED back step by step by the pressure of events, the rulers of the world are at last approaching fundamental causes. That is the meaning of the Genoa Conference. The last makeshift which the money manipulators tried was the proposal to cancel all the war debts—a most humane thing to do, if it benefited human beings in the large; but a most inhuman thing to do if it only gave a false monetary system a new lease of life. With that makeshift refused, the rulers are now face to face with the sources of supply—material, labor and management. Exalt these and inevitably you put money back into its natural place as the servant of these. It could not have been done had another money poultice been permitted. Genoa is the world's first step back to economic foundations.

Ignace Jan Paderewski, Artist and Statesman

An Interview With Poland's Former Premier, Now a Rancher in America

By ARTHUR J. K. DE PEW

FAR from his native Poland and the turmoil of European politics, in which he was so active for a time following the end of the World War, Ignace Jan Paderewski, the renowned pianist and statesman, is living in semi-retirement in the United States. He is just a plain rancher near Paso Robles, California, where he is trying to recoup his fortune that was depleted by the war.

Paderewski's life today, that of raising fruits and nuts for the market, although on a fair-sized scale, is a far cry from concert halls, where great audiences sat enthralled by his artistry; or from war-time gatherings, where he stirred his countrymen to patriotism by fervent speeches, but he is content. His beloved Poland is free, and, as for the thrills of his music—well, Paderewski says his skill has not deserted him, although at the present time he has no thoughts of making a concert tour.

On a bright morning recently I passed some hours with Paderewski and listened to him tell, in his own modestly self-deprecatory manner, of his varied musical triumphs here and abroad, the work of reorganization and construction which he has done for Poland, and something of the pleasure he experiences in his new life here in America.

"I shall be delighted to tell you anything you wish to know," he said.

"Please tell me something of your early life in Poland," I said. "I suppose you had the usual hardships to contend with."

"I'm afraid I haven't any stories of early struggles to relate," he smiled. "Indeed, my boyhood days are among the most pleasant memories of my life. They were passed chiefly on my father's country estate near Podolia, a small town in Poland, then under Russian rule. I suppose I was much like other youngsters of that day and age—as good as the worst of them and as bad as the best."

"Had you any brothers or sisters?"

"Yes, I had one sister, Antoinette. She is a widow now, living in Switzerland. She also was musical, but she never cared to play in public. She was a quiet, home-loving girl, and a career had no attractions for her."

"Did you inherit your talent for music?"

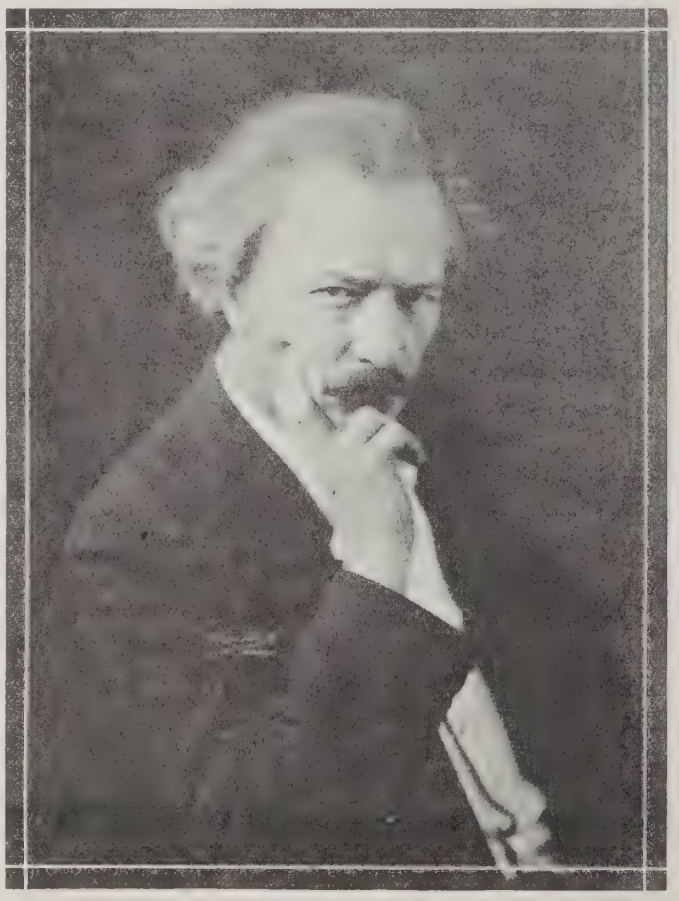
"From my father, I think," he answered. "My mother died at my birth. Strange to say, my father was the only musical member of his family for many generations, and his greatest delight was in playing the organ at the little church in Podolia. Up to my thirteenth year I received my musical instruction from him. Then he sent me to the Conservatory of Warsaw, where I studied piano under Janota, and later under Roguski. I worked hard, and my playing finally began to attract some attention. You can imagine my joy when I captured first prize. Then I determined to try to capitalize my efforts and see something of the country at the same time.

"I had heard many tales of suffering among the poor in Russian Poland and I wanted to see for myself. I found conditions even worse than depicted, and the trip left an indelible impression on my mind, and to some extent altered the whole course of my life. I became convinced of the righteousness of the Polish cause, and understood fully, for the first time, the great longing of the Poles for liberty. I suffered with them in their trials and gloried in their patriotism."

"And what of your musical triumphs on this trip?"

"There weren't any," he smiled. "The audiences were small and unappreciative."

As I listened to Paderewski talk, I began to understand something of the complexities of his nature. Evidently his is a sort of dual personality, a strange blending of the practical and the ideal. Just now the artist was uppermost. His eyes were shining and a reminiscent smile played about the corners of his mouth, but my next question quickly dispelled it:



"I understand you studied in Germany and Austria. What impression did you have of Germany in those days? Did you fear for Poland's future at her hands?"

"Yes. When I was 19, I went to Berlin and studied composition under Professor Urban. Even then I was keenly interested in the psychology of the German mind. Eventually I became sure that the Germans were even then striving for world conquest, and regarded themselves as the future masters of all other nations."

He paused to light a cigaret, and continued:

"Strange to say, that conviction became a real incentive to me. Some day—some time—Poland was going to need help. I dreamed that when that time should have arrived mine should be the voice to plead her cause before the peoples of the world. I would gain an international reputation so that when the proper time came I should be able to command the attention of those most able to help her. So I put forth every effort and bent every energy to the end that I might become a really notable pianist, and the next four years were among the busiest of my whole life, I think."

How well Paderewski succeeded in accomplishing this dream is evidenced by the fact that four years later, when only 23, his genius had become so pronounced that he was made a professor at that great seat of learning, the Strassburg Conservatory. While there he had opportunity to study the methods of the masters of the profession. This period of study had made it possible for him so to perfect himself that he looked forward to the last goal he had in mind, a course of music in Austria under the great master, Leschetizky, for which he was finally able to save sufficient money to undertake.

IGNACE JAN PADEREWSKI

His first really successful appearance was when he was about 28, in Paris. It was here that his world-wide celebrity began, and it has lasted 33 years. Following this engagement, he went to England, where also he was acclaimed.

"Why had you failed to visit America up to this time?" I asked.

"Ah! the United States is not always kind to unknown artists, and that I might receive a real welcome from the music-loving public in America it was necessary first to establish myself in Europe. After my success in England I felt I had proved myself, so to speak, and determined to turn my eyes westward."

So in 1889 he came to America, and on a tour lasting 90 days he played 110 times to record-breaking crowds, and received ovations in every town and city he visited.

"My greatest joy at the concerts came from the delight often evidenced by some poorly clad person in my audience—perhaps some poor music-loving foreigner who had spent his last dollar to hear me play," he said.

Paderewski has made nine tours of the United States, and has played in Europe every year since 1889. His travels have taken him into every part of Europe, Siberia, Australia, New Zealand, South Africa, Canada and the United States. But, while he has been in Siam, Afghanistan, and other parts of Asia, he has never visited Japan, China or India during these Asiatic trips, and so today they are the only three countries in which he has never appeared in concert.

When the World War broke out, Paderewski was living at his permanent home, the Villa Riond-Bossen, at Morges, on Lake Geneva, in Switzerland. He immediately opened his beautiful villa to penniless refugees of every nationality, without distinction.

Early in January, 1915, Paderewski, with his friend, Henry Sienkiewicz, the author of "Quo Vadis," instituted the General Polish Relief Committee to aid stricken Poles. His really active efforts in behalf of humanity date from that time. He began a tour of France, England and America, aiding, encouraging and spreading cheer among his fellow countrymen, and founding branches of the committee under the name of the Polish Relief Fund. Paderewski's active political work began after November 5, 1916, when the Germans, desiring to make quick incursions into Russia, issued a proclamation declaring an independent Poland, and in return for that action made an arbitrary demand for Polish soldiers to swell the German ranks. Paderewski was in the United States at the time, and immediately prevailed on the Polish National Department, of Chicago, of which he was the president, to send a protest to the Poles strongly urging against any soldiers enlisting for service in the German Army. The protest was effective in halting Polish recruiting, and the Germans were prevented from obtaining in the neighborhood of 1,500,000 additional soldiers; with whom they could have swept through Russia, to the great disadvantage of the Allies.

In the early days of the war the people of the United States, remembering the efforts in her behalf of Kosciusko and Count Pulaski during the struggle for independence, turned a listening ear to the pleading of another Polish leader for that devastated country, and opened their hearts and pocketbooks for her assistance. Through his patriotic addresses Paderewski raised $1,300,000 for the Polish Relief Committee.

While Germany was bending every military effort and exerting all her diplomatic wiles to prevent America entering the war, the Polish people were yearning for freedom and casting their eyes toward their Fatherland. On April 7, 1917, Paderewski made a speech, asking that all Poles in America who were not bound by an oath of fealty to the United States enlist immediately under the banner of France. The result was a Polish Legion 80,000 strong. In speaking of it, Mr. Paderewski said: "The day these men, drawn from all conditions of life, passed before me in review, my heart told me that Poland would surely attain her freedom." And eventually that conviction became a truth.

Paderewski was in America from April 14, 1915, until November 23, 1918, during which time he was in constant touch with the State Department at Washington, and influential persons, conferring with them on Polish national questions. Conditions had so adjusted themselves that on November 23, 1918, he was ready for his European work and sailed for Poland. The allied governments had made it conditional that the recognition of Poland would take place provided only that Paderewski assumed the reins of power. With that condition was another, seemingly impossible, considering the disrupted state in which the nation now found herself, that there should be no further bloodshed In January, 1919, Ignace Jan Paderewski became Premier of the new Polish Republic and proceeded to bring order out of chaos.

For 10 months he labored as Premier, dividing his time between the Polish seat of government and the councils of the conference at Paris.

"I believe in clean politics," Paderewski said, "and when the time came that Polish statesmen began to follow tactics that I felt to be inimical to the welfare of the country, I had no course left than to express my earnest disapproval and resign the premiership, which I accordingly did, in November, 1919."

He came to America and later to Paso Robles. He says he has no intention of returning. Paderewski's wife is as unassuming and self-sacrificing as her husband.

Patent Office, Year Behind, Is Breaking Down

Examiners, Highly Trained, Leave in Numbers; Replaced by Unskilled

By THOMAS E. ROBERTSON

Commissioner of Patents, in an authorized statement to A. R. Pinci

DURING the calendar year 1921 the Patent Office at Washington received a total of 111,740 applications, divided as follows: Applications for patents for inventions, 87,406; applications for patents for designs, 5,593; applications for registration of trade-marks, 16.231, and miscellaneous applications, 2,510. According to statistics compiled by William I. Wyman, chief clerk, during 1921 the increases over 1918 were 53 per cent in patent applications, 150 per cent in design applications, and 130 per cent in trade-mark applications. During the same period the increase in the average number of employes was four and one-half per cent.

On January 1, 1922, there were 61,546 patent applications awaiting action, as against 23,738 at the beginning of 1916 and 19,634 on the same day in 1918. The average new case is reached for its first action about six or seven months after it is filed. This is not a healthy condition.

The Patent Office, in fact, is in a deplorable condition. The actual situation is shown by the fact that a number of divisions are more than a year behind with their work. The cause lies in the continuous stream of resignations of examiners. In two years 163 examiners resigned. These men who were scientifically trained and also members of the bar have been replaced by inexperienced men, fresh from college, without any knowledge of patent law or any legal training. Moreover, the men who resigned were familiar, through years of experience, with the particular art with which they were engaged, and it takes years to train new men to take their places.

As one example, reference may be made to one of the chemical divisions, where five out of nine examiners have been appointed within the last few months. At the close of the fiscal year one of these had been in the office only one week, another three weeks, another seven weeks, another two months. One out of every four examiners has resigned in 16 months and more than one-half—231 out of 437—have resigned in 32 months.

Relief is imperative. The Patent Office is breaking at the very moment it should be responding in the fullest extent to the depressed industrial conditions of the country. The Secretary of Labor reports that there are millions of unemployed in this country and the Patent Office should be helping to provide new avenues for employment, whereas it is retarding industry by holding up for a year or more patents on which new industries would be started.

The only way to stop the stream of resignations is to increase the salaries. These examiners, paid in 1848 the same as Congressmen ($2,500), have had an increase of only $200 since that time. By comparison with many other Federal offices, the position of patent examiner has degenerated from the best paid to one of the poorest paid of the technical positions.

House of Representatives Bill 7077, passed by the House in January and now before the Senate, is designed partially to remedy the situation and to provide slightly larger salaries for the examiners, pending the general reclassification of Federal employes. Some increase is necessary to get suitable men to fill the vacancies and to retain the men already in the office. Relief is provided without costing the taxpayers a single cent, since the Patent Office is self-sustaining. Yet it is apparent from the figures given and the conditions cited, that the business presented to the Patent Office is altogether too large in volume for the present personnel to perform properly, and unless remedial measures are effected to provide also an increase in force, the present deplorable condition may continue.

I believe that a salary somewhat commensurate with the work our examiners are doing will serve to retain them—not all of them, but the vast majority of those who would otherwise resign. A few men are so constituted that they would rather get out into the busy world and argue cases in court, but most of these men are not. They are scientific men. They are men who would rather do research work; they would rather have an honorable position in the Patent Office, if it is honorable—and at the present time some of these examiners do not any longer consider it an honorable position.

Why? Because they have to do their work so speedily that they cannot give it even respectful consideration. The principal examiners, each aided by a number of assistants, have to go through these cases with all the care in the world; at least, they are supposed to. Those chief examiners review 100 cases a week.

Now, the work that must be done is not easy work. I should like to point out just what constitutes this work and I have selected a patent case.

It is one of those little consecutive numbering machines to print numbers on checks, pages and indexes. They may be seen all over the United States. The machine sells for from $10 to $18. There are hundreds of patents on them; the case in question is merely one improvement.

When an attorney has an application like this, no model is filed in the Patent Office. He has to furnish drawings in which every detail is shown most explicitly. Often one sheet of drawings is sufficient; frequently there are many sheets. The numbering machine application involves six sheets outlining many complicated parts, parts so small that they can all be put into the hollow of one's hand.

When the application for the little numbering machine was prepared, it was filed with a petition asking for a patent, a power of attorney, a description containing 26 typewritten pages, 70 paragraphs or claims, and an oath in which the inventor swore that he was the first, original and sole inventor, that the invention was never known or used before he made it, or patented or described in any printed publications in any country, before his invention; that it had never been patented in this or any foreign country to him or to any one else or been in public use for more than a certain length of time; and that he obtained no patent on an application filed in any foreign country for more than 12 months before he filed his application in this country, and so on.

At the end of his descriptive matter, the inventor claims what is new with him—in this particular case, 70 paragraphs that we call claims. Each one of these must be different, and yet this inventor sets forth 70 alleged points of novelty, and the law requires that every one of the claims shall be new and original with him. If he claims more than is original with him, he is fencing in something that belongs to the 100,000,000 people of America. Now, the case is prepared by the attorney—and the big corporations have very skillful attorneys, sometimes several in a single case.

The examiner has to decide whether the invention is operative, if it will do what the inventor says it will. If not operative, he will reject it for that reason. He must also see if the inventor is making any laudatory claims to his invention or claiming it is superior to others, whether he is taking any unfair advantage of others. The examiner must not only understand all 70 paragraphs or claims, but he must understand them so thoroughly that he can keep within his head a vision of all of them. Again, why? Because after he gets that mental vision he is obliged to go through all the United States patents on these numbering machines, and there are hundreds of them, and if he does not find the invention (or the equivalent of it) in the United States patents he must go through all the English patents; then through all the French patents, in the French language; then through all the German patents, printed in German; and through all other foreign patents that are in existence on numbering machines—and there are hundreds of them in this single class. A mistake means the grant of a patent which will be the beginning of an ultimate suit that may cost thousands of dollars to defend and get away from, even though the patent may be declared valid.

But the examiner's work is not ended, even after having done all this. He has to acquaint the attorney with what he has done. In this particular case he had to write an official letter comprising five typewritten pages, and this was an easy case in one respect, because he found only five clerical mistakes, but sometimes he has to take several typewritten pages to point out the clerical mistakes. After he gets through with the clerical part, the examiner's judicial action follows. In this official letter the examiner rejects 33 out of those 70 claims.

That is the beginning of the examiner's work. It is only his first action. When the applicant gets that statement from the Patent Office he finds that a great many of his claims have been rejected. It is, by the way, a well-known fact that attorneys usually fence in more than an inventor is entitled to so as to be sure to get all that he is entitled to, and frequently there is a battle royal between the examiner representing the general public on the one hand and his skilled attorneys representing the particular applicant on the other hand.

Above, left—Examining division—note lack of space; center—Thomas E. Robertson, Commissioner of Patents; right, wood shelves afford constant menace of fire; below—public search room.

The applicant's reply to the official letter takes 13 typewritten pages, and really reopens the case, since he wholly rewrites 17 claims and changes 18 others. Should the applicant wait for a year before replying, as the law permits, the examiner may have forgotten the intricacies of the invention and must consume perhaps a whole day, or several days, in intricate technical cases, in refreshing his memory. If he has resigned, a new examiner must act on the case *de novo*. If the applicant has changed some of his claims, as in the numbering machine case, a new search is necessary. The examiner must make, therefore, another official action. In this numbering machine case it is only three pages and involves the rejection of only 12 claims, the other 58 being allowed. One might suppose that the examiner's work was now about over, but lo! the applicant again amends his case, rewriting 13 claims, changing seven others, and inserting five entirely new claims.

The examiner must go over the whole case a third time, and this time he writes the applicant that all the claims are now allowable except for a few minor objections noted.

Cathedral Is Climax to Twenty Years' Pastorate

Eighteenth-Century Rose Glass From Westminster Used in Church's Windows

By FRANK M. CHASE

TO HAVE spent a score of years in one pastorate has not been the fortune of a great many clergymen. To have directed the erection of a house of worship in the course of their long terms has been the lot of fewer. But to have combined these accomplishments with an extraordinary personal share in the building of a notable cathedral sets the Very Reverend James Philip de Bevers Kaye apart.

For many years parishioners of the old Grace Church had dreamed of a cathedral. Even in 1888, it having become necessary to have a new place of worship, the guild hall was erected with a view to its temporary use as a church. But the proposed cathedral, owing chiefly to lack of finances, was not yet to be. Realization of the long-deferred hope did not seriously commence until Dean Kaye went to Topeka in 1901. Revived under his leadership, the project went speedily forward. In 1909 ground was broken for the new cathedral, and three years later the exterior was completed. A shortage of funds then occasioned a delay of several years, so that Grace Cathedral was not brought to its present state of completion until 1917. It was consecrated March 4 of that year.

Quite naturally, the work of raising the necessary funds fell mainly upon the dean, and this, in a parish having but 350 members when he came, was not an easy task. But Dean Kaye has had a much more intimate part in the building of Grace Cathedral than simply that of a money-raiser. He not only conceived the general architectural design, but has put his thought and personality into the building in numberless other expressive ways.

In Dean Kaye the scholarly type of mind blends with an evident artistic nature. Ecclesiastical art and architecture have been his lifelong studies, in pursuit of which he has, while on various trips, visited most of the famous cathedrals and religious shrines of Europe. He has spent months in studying the old masters' works in Italy, and is an authority on Florentine art. Thus equipped, he was qualified to contribute a great many valuable ideas to the cathedral project. Fortunately, he was permitted to work out his plans with full freedom, by reason of which Grace Cathedral represents his thought and labor to an unusual degree.

The VERY REVEREND JAMES PHILIP DE BEVERS KAYE, builder of Grace Cathedral, of Topeka, Kansas. The cathedral is very largely the work of one man, its dean. Within this cathedral are many treasures of historical interest.

Though a Gothic structure and embodying features taken from noted European cathedrals, Grace Cathedral is not a copy of the medieval church. In designing it Dean Kaye and his associates were guided by two desires: to preserve in a general way the traditional plan and form of the Christian church as it has been handed down for many centuries, yet to provide the comfort and convenience required by the modern congregation of a thousand or more persons.

"The church of the Middle Ages made very little provision for the comfort of the worshipers," he said, in explaining the architectural changes enforced by modern conditions. "There were no seats, no heat in winter, and the long nave with its row of big pillars made it next to impossible for everyone to see and hear. But such things mattered very little in the thirteenth century, for the service was in a different tongue from that in which the people spoke, sermons were few and far between, and church attendance was, as far as the ordinary man was concerned, a mere mechanical observance of certain acts and forms to be regularly followed for more or less superstitious reasons."

To conform with modern requirements the nave of Grace Cathedral was therefore made both shorter and wider, proportionately, than would have been the case in an ancient church. The ceiling, too, differs from many of the Old World cathedrals in that it lacks the stone vault. Instead, the ceiling is of wood and plaster, supported on carved wooden trusses or hammer beams. Practical considerations dictated this departure from traditional custom, as a stone vault would have cost more money than was available for the entire building.

The chancel is smaller and lower than the nave. This idea is borrowed from the cathedral at Gerona, Spain. It is not only an effective arrangement from an esthetic point of view, but provides room at the sides for the choir room, sacristy and morning chapel.

Though the chapel is incomplete, it is a beautiful spot and one of the most noteworthy features of the cathedral. Its floor is of marble and terrazzo. All its woodwork is of fine black walnut, the satin-like wainscoting being especially attractive. This wainscoting has an appealing connection with the history of Grace Cathedral, as it was made from the pews used in the first church of the parish, which was begun in 1861. The timber from which the pews were made was cut by the pioneers in the woods surrounding Topeka, and shaped entirely by hand. Above the altar of the chapel is a large original painting, "The Transfiguration of Christ." This canvas is by George M. Stone, a noted artist, and has been highly praised by art critics. By means of a separate console, seven stops of the main pipe organ can be played for services in the chapel.

The glass in the cathedral windows is believed to be artistically equal to any in America, and perhaps is as good as exists. It is a copy of the best glass placed in the cathedrals of the fifteenth century. All the windows conform to a plan pre-arranged by Dean Kaye. This not only made possible uniform excellence in the windows, but permitted the installation of a series depicting the chief events in the life of Christ. Beginning with a scene of the nativity in the large window in the west transept, the series extends around the lower part of the building to the corresponding window in the east transept, where the resurrection is shown.

The rose window in the east side of the cathedral is made of glass that was left over when the large rose window was placed in Westminster Abbey, early in the eighteenth century. The unused glass was stored in the cloister of the abbey, where it remained until Bishop Millspaugh, third bishop of Kansas, discovered it in 1907. He at once conceived the idea of placing some of this glass in Grace Cathedral, and in due time a pattern for the proposed window was sent to England, that the glass might be fitted there. When the completed window arrived in Topeka it was found to contain in Old English the numerals 1722. For a time these were meaningless, but it was eventually learned that Dean Atterbury, of Westminster, under whose direction the rose window had been placed, was in that year sentenced to the Tower of London for high treason; this being the outcome of his connivance against the Georgian government and efforts to restore the Charles régime.

Contributing especially to the interior beauty and meaning of Grace Cathedral, and indicative of the artistic hand that planned it, are its numerous pieces of wood carving. From historical and religious points of view, there is special significance in the use of carved wood for church decoration. The art of sculpture of every kind began with the rude fashioning of wood, while the first known representations of the gods were figures cut from the trunks of trees. Its own peculiar qualities of richness, softness and quiet charm also make wood carving highly appropriate for church use.

Set in the altar is a masterly reproduction, in oak, of da Vinci's famous fresco, "The Last Supper," the original of which is in the refectory of the Cathedral of Milan. The decoration of the pulpit also is of exceptional merit. This ambitious piece of work includes, besides other less noticeable details, 11 figures, and is regarded generally as the finest example of the wood carver's art found on any pulpit in America. The figures represent the Saviour, four evangelists, St. Paul and five adoring angels.

All the wood carving in Grace Cathedral is by Alois Lang, of Oberammergau, the town famous for its production of the Passion Play. Several members of the Lang family, in fact, are to participate in the play this year, one, Anton Lang, portraying the character of the Christ for the third time. Wood carving, however, has a larger place in the daily life of Oberammergau than the production of sacred drama. It began there with the establishment of a school of wood carving by the Benedictine Fathers in 1332, and it is now the occupation of a large percentage of the male inhabitants. Alois Lang was reared and trained in this atmosphere. Of unusual ability, with which is combined a devout spirit, he has been able to produce some remarkable work, of which Grace Cathedral has some of the best.

Under the cross, on the altar of the cathedral, is a stone taken from the ruins of the historic church built at Lindisfarne, off the east coast of Northumberland, about 500 A. D. This church is called the cradle of Christianity in England. The first church and monastery—probably of poles, rushes and mud—was replaced by a red sandstone building, a part of which was the relic now reposing in Grace Cathedral. Another notable relic in the cathedral is a baptismal spoon that dates back to Olaf, the first Christian king of Norway. It is one of five made by him.

"The cathedral must never feel that it has reached a point where it may stand still, where it may rest in quietness, satisfied with its own beauty or accomplishments," said Dean Kaye, "but it must be ever reaching out, ever aspiring, adding always to its beauty, adding always to its service, and so hallowing itself in the hearts and lives of men."

Dean Kaye believes that the cathedral should endeavor to serve all the higher interests of the community, that it should be a center of art and music, education and culture. And in this view his own numerous activities for the community welfare coincide. A civic improvement association which he organized soon after coming to Topeka has contributed much to the beautification of the city. He has also been active in promoting the musical and art interests of the community.

Dean Kaye was born in 1869 at Darleston, England, a small town on the Severn River, about 30 miles from Stratford-on-Avon. He came to America at 12, and was educated at the West Philadelphia Divinity School and Kenyon College. Ordained into the priesthood of the Episcopal church in 1891, he served at Alliance, Ohio, four years, and at Ironwood, Michigan, six years, before coming to Topeka.

From Bryan's 16-to-1 to the Federal Reserve

A History of the Taking Over of Washington and Government by the Financial Interests and How "Gold Standard" Figures

"INVISIBLE government" is an explosive term, judging by the effect its even moderate and well-supported use by well-posted men has in certain quarters, where at once a display of dazzling chirographic or oratorical fireworks is set off. The method varies but the object is always the same; that of confusing the people. It must be admitted, however, in all fairness to the unseen but not unknown powers, that they have been the victims of more or less preposterous exaggerations, voiced generally by professional reformers whose intentions are not always parallel to their views.

It requires only one exposed exaggeration to counteract a hundred honest charges. That is why today the people's attitude is not wholly receptive to the attempts of independent thinkers—be they legislators, publicists, pioneers—wholly unaware, however, that their composite dissatisfaction is due to their own mental laziness. They do not realize that today's troubles are but a recurrence of similar troubles in the past. Such events move in cycles and as each is completed a trial balance is struck. This usually shows a profit, but it is not one in which the people themselves share. Their duty is to pay the carrying charges.

It is not necessary to go very far back into history to trace such a cycle. One was being completed about 1895. Another matured about a decade later. The completion of another has either been encompassed or is about to be.

But the Issue Was Not Settled

DURING the campaign of 1896, William Jennings Bryan delivered his famous "Cross of Gold" speech. Bimetalism was an issue. It is not necessary to explain here the issue. Suffice it to say that the Commoner's "Sixteen-to-one" slogan was made to appear ridiculous. Ridicule wiped the Democrats off the political slate that year. *The economic issue was not settled one way or another.* The subject is as fresh today as it was a quarter of a century ago. It will continue to reappear until it is settled right—and there are signs that its final solution in favor of justice and the people is now nearly due.

Mr. Bryan's speech was notable, however, for certain declarations which in themselves were the object of the organized attack which was aimed at his silver issue—and probably such an issue in the hands of a political administration might or might not have had bad economic effects. But the real reason for Mr. Bryan's defeat lay in these long-since forgotten words:

> "I stand with Jefferson rather than with them, and tell them, as he did, that *the issue of money is a function of the government, and that the banks ought to go out of the governing business.*"
>
> **The banks ought to go out of the governing business!**

He had already adverted to the fact, earlier in the address, that he believed that *"the right to coin and issue money is a function of the government."* He said that it could *"no more with safety be delegated to private individuals than we could afford to delegate to private individuals the power to make penal statutes or levy taxes."*

The peculiar thing about the campaign of 1896, in relation to its strictly economic issues, is that the manipulators of public opinion want everybody to assume that it was the final—the irretrievably final—decision of the American people to stand by the so-called gold standard. It is a most absurd assumption. Not one voter in a hundred cared then a whit for either the gold or silver issue, any more than he would have cared for the issue of symmetalism. The issue of the gold standard was not settled then, and as far as the people themselves are concerned, they will take it up again and take back to themselves the functions which the Constitution gives them.

Laws Aid Them Keep Grip

THE bankers, especially the national and international bankers, governed the United States in 1895 as much as they are doing it today. Today they govern the country through the instrumentality of laws not on the statute books at that time; laws which are facilitating their devious policies while—this is the great joke—both Republicans and Democrats have united in playing into their hands!

It does not require unusual perspicacity to realize that while the master-bankers have a predilection for gold or the gold-standard, and will go to no end of trouble to defend either, they would in an emergency adapt themselves to the silver standard and do on a silver basis that which they are now doing on a gold basis. Hence it was not the silver scare that caused them to defeat Bryan in 1896, but the realization that a comparatively unknown citizen who fearlessly attacked their pet standard represented a type of American conscience and insight that would cast them out of the temple and permit them no more to function as the invisible governors of the United States.

As soon as it realized that the sixteen-to-one issue was of little interest to the voter one way or the other the invisible government fell back upon its ancient defenses, such as the tariff and the employment situation. *These, by the way, are also the issues today, too.* Still unsettled!

By the time that Roosevelt was at the height of his popularity, about 1905, the money question had been forgotten, to a degree, but the situation was about as bad as ever, and because the people showed evidence of dissatisfaction, much noise was made about the trusts. Those whose memory of those days is still fresh will undoubtedly recollect that the entire Rooseveltian administration was one continuous ballyhooing against monopolies and trusts, nicknamed by President Roosevelt "the predatory interests." The record shows a great deal of activity against this or that trust, *but the one trust let alone was the money trust.*

The entire money question, the entire banking legislative program, were left severely alone during the years 1901-1909. The reason may not be difficult to trace; Mr. Roosevelt had absorbed the Wall Street idea many years before. His nomination for governor of New York in 1898 was consented to by Boss Platt because "two influential campaign contributors, Mr. Morgan and Mr. Whitney, especially Mr. Morgan, liked him."

In Roosevelt's now famous letter of October 14, 1904, addressed to Mr. E. H. Harriman, the writer said, toward the very end, that "before I write my message, I shall ask you to come down to discuss certain government matters not connected with the campaign." The message in question was the annual message to the Congress. This letter was published by the New York *Tribune* at the time and was never contradicted. It was this Mr. Harriman, by the way, who openly asserted that the most successful monopolies of those days, especially those presided over or directed by Thomas F. Ryan, had been organized by Elihu Root, then Secretary of State, and since then the most influential spokesman, in office and out of office, of the international bankers.

These revelations, of course, made their appearance in the public press, and for a time threatened to extinguish the entire G. O. P. organization, but by artificial means other matters were drawn into the Roosevelt program, and the conservative newspapers, somehow, soon forgot the whole unsatisfactory mess.

One of the most humorous bits of performance during the Rooseveltian era was the feverish anxiety of certain administration officials to explain the presence of J. P. Morgan and later of John D. Archbold, at Oyster Bay. The former the leading American capitalist, the power of whose name still makes industrial United States tremble—and the latter the chief power in the Standard Oil interests, supervised about everything that was worth supervising, in dollars and cents, in the United States, and, in addition, supervised whatever might affect up or down those dollars and those cents.

Roosevelt and Big Business

THERE have been critics who have charged that Roosevelt took orders from Wall Street. That is not true. Theodore Roosevelt did not deserve those criticisms. But, just as he glorified Caesar and Napoleon in one sense, he had been brought up in an environment that caused him to glorify Morgan and Archbold, as great organizers and captains as either of their military prototypes. Yet no biographer of Roosevelt has satisfactorily explained why Elihu Root, upon becoming Senator from New York, was succeeded as Secretary of State by Robert Bacon (even if for only a few weeks, until Mr. Taft's inauguration) an active partner in the Morgan bank supplanting in such high office the chief big-business attorney in the United States.

The appointment to high executive office in an administration of men actually or remotely connected with big business is not an evidence of double-dealing, but it is an evidence of contradiction. This is especially true in those instances where campaigns have been waged in behalf of the "people."

President Wilson's administration was a Simonpure, common-people administration, nominally, at the outset. With an exception or so, the "biggest business" that most of his appointees ever knew of was that of public office then and there being held. But alas! It was not long ere the invisible government began to exercise its time-honored discretion, and in spite of Wilson and Bryan (17 years had caused the latter to modify his opinions) the very bankers that did not want the Federal Reserve Act enacted proceeded to transform it into what it has become—their handiest tool. New York today, with the Federal Reserve laws, controls the money of the nation as it never did without the Federal Reserve laws, and moreover its volume of money is even greater and its discretion wider!

There is a wide divergence between the Federal Reserve System as originally propounded by Senator Robert L. Owen, of Oklahoma, a people's Democrat, and the accomplished fact. In truth, Senator Owen frequently criticises the Federal Reserve Board on the floor of the Senate and occasionally accompanies his criticism with a remedial bill. But what seems to be the case, after all, is that not Senator Owen, not Senator (ex-Secretary of the Treasury) Carter Glass and a host of other legislators and statesmen seem to know just what the Federal Reserve Board does, how and why it does it. The Congressional Record is full of differences of opinion.

One thing is obvious; the Federal Reserve Board may not be above the law but ostensibly is beyond the law. Just now it is indulging in political activities through its banks that leave much to desire; the spectacle is worse than any ring-politics in the days of Ouay or Platt. The political bosses of a generation ago did not conceal the fact that they had methods of their own to achieve results and as these methods were known the harm was only half as great, but the scattering about by a Federal bank of political propaganda in connection with the approaching campaign in certain southern states is indeed iniquitous.

Complaints of this sort have already been heard, albeit feebly. Much as man or woman may like to vote impartially, no one will vote one's convictions at the risk of pecuniary loss. Bankers, little and big, have been known to put the screws on clients who became identified with certain political movements. It is all very well to prate about secret suffrage, since this after all means the secrecy of the ballot, but how can voters actually interested in their community's welfare, forced to fight openly for it, conceal their preferences? They are either for one party or another; they are either for one candidate or another. Isn't it rather ridiculous to orate about the secret ballot when the average voter's candidates and preferences have been known in the community throughout the campaign? That is how the bankers know where to use moral suasion first and another kind of suasion afterward.

The foregoing observation is made here to forestall the hoary argument that "secret suffrage" protects the voter. To this extent, therefore, it is not difficult for the more responsible element of any community—the industrial and commercial element, subordinated by the financial—to swing public opinion, if public opinion can be swung at all.

That the "little fellows" below must adapt themselves to the demands of those above is beyond question, and this adaptation may be encountered in every degree on the social or financial scale. Politics has its adaptability, too. Take the case of W. P. G. Harding, governor of the Federal Reserve Board. He would rather serve the allegedly superior master minds of metropolitan centers than the countless normal minds of Brown, Smith and Jones.

Williams a Courageous Figure

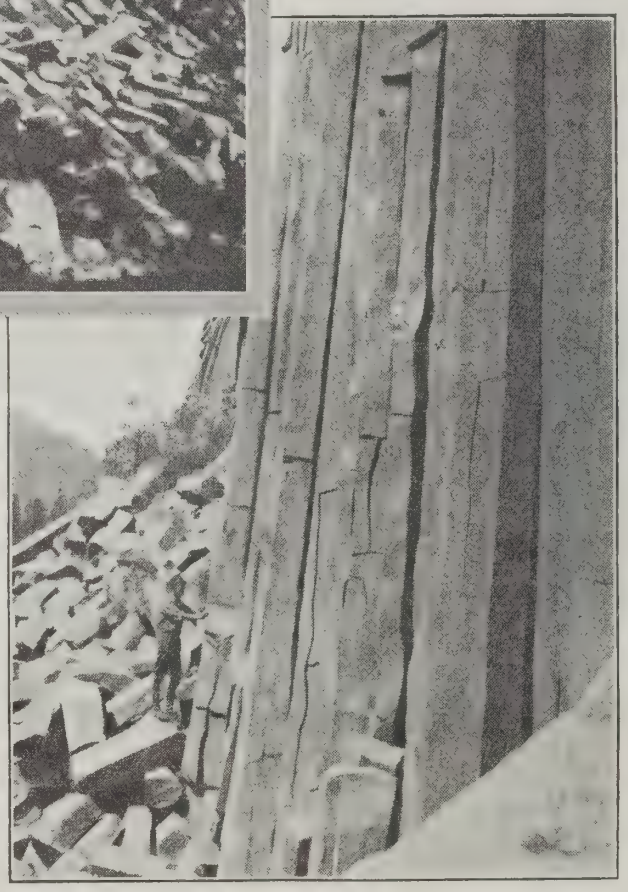
WHEN he was nominated on the board by President Wilson his advent into Washington caused no ripples of excitement. In those days Paul Warburg sat in disdainful loneliness and he was the boss of the board. John Skelton Williams, controller of the currency, ex-officio member of the board, and one of the most courageous and independent thinkers to sit in Washington for many a year, had to wait until he left office ere he dared voice some of his criticisms. Mr. Williams was never liked by Wall Street for the reason that shortly after he assumed office he and Secretary McAdoo eliminated from the Treasury Department an "employe" who was supposed to be a paid clerk of the Riggs National Bank of Washington, but was in reality a representative—just how authoritative was never learned—of the National City Bank of New York, the largest national bank in the United States. The Riggs National Bank is the Washington branch, so to speak, of the New York institution. Milton E. Ailes, its present president, a short time ago was receiving a salary of $5,000 a year from the New York bank as its "Washington representative." It is, this, something more wonderful than the interlocking directorates.

The Riggs National Bank of Washington, D. C., frequently referred to as the bank of Presidents, because most of them keep their deposits there, is the leading bank at the capital. It is the bank of most of the responsible diplomats, the depositary of funds of foreign nations, and, in addition, of the millionaire colony. Because of this it is in high standing. Charles C. Glover until about a year ago was its president and had been for many years. He was and still is one of the most popular society men. Nothing of civic importance could be undertaken successfully unless Mr. Glover was among its sponsors.

Were Far More Than Dinners

THE Glover dinners—not so much of recent times, but dating backward from the end of the Taft Administration, and reaching zenith between 1900 and 1905—were more than dinners. They were embryonic legislative caucuses. It would not be too much to say that they perhaps marked either the birth or conclusion of some act of statesmanship. In those days, moreover, the real political powers of Washington were more cohesive than they are today, and as a result social interchange was much more exclusive than it is today.

The machinery was so well oiled that everything progressed according to Hoyle. Senator Nelson W. Aldrich and Mr. Glover met frequently, and when this happened it was more than the meeting of two wealthy gentlemen anxious to talk over their golf scores, because golf was not yet stylish. The Rhode Island Senator was always, first and foremost, the chairman of the powerful Finance Committee, and Mr. Glover, likewise first and foremost, was the benign representative of the inner New York financial ring. Last year Mr. Glover was shelved; he was made "chairman of the board of directors of the Riggs National Bank" to make way for Mr. Ailes, the messenger of the National City Bank of New York, despite his otherwise conspicuous title. There are rumors that the change was effected after some trouble, since Mr. Glover was said to be unwilling to relinquish his position, but the fact probably is that since the advent of the Wilson Administration and the death of Senator Aldrich, Mr. Glover's influence was weakened.



During the Wilson Administration, moreover, the

Beauty of Postpile Grows as Columns Crumble

Phenomenon of Far West Seldom Visited; It Is Off the Traveled Trails

The Devil's Postpile is constantly crumbling, but its new columns are better as the old fall away. The arrow points to the fine pillar since destroyed by lightning. To judge the size of this natural wonder note the figures of the men on the huge pile of fragments, within the white circle in the foreground.

At right—A close-up of the prismatic formation. The man standing in front is a six-footer.

By JOHN L. VON BLON

THE Devil's Postpile, natural world wonder and national monument, is crumbling. Mysteriously wrought in the cosmic crucible, possibly when our planet's foundations were laid, it gradually is succumbing to the onslaughts of elemental forces. But let not this startling statement occasion immediate alarm or regret, for here's a comforting paradox. The basaltic marvel of the California wilds improves as its destruction progresses! And as it likely will hold out for another thousand centuries there remains time to go and look it over.

Disintegrating agencies sunder the masonry of the remarkable structure, and frost, earthquake, tempest and thunderbolt rend, topple and shatter its adamantine supports, but always the newly exposed columns stand forth stronger, more perfect of form, more brilliant in their pristine glory. So huge is the mass that it must endure for ages before demolition shall be complete. That this is constantly, surely going on a glance at the illustrations will make apparent. Fortunately, it affects only the outermost segments, hence a year discloses but slight change.

Do you know where the Devil's Postpile is? Have you ever heard of it? Though set apart by the President a decade ago, authoritatively recognized as the best example extant of its peculiar type of columnar basalt, and readily accessible in summer, it remains virtually unseen and unknown. Not more than one out of every 10,000 Americans has beheld it or could tell its location, while foreign governments and institutions send their scientists to study the splendid tower of long, dark, glistening prisms in all its fascinating aspects. This phenomenon, which thus far has attracted so little interest among our own people, is but a few hundred miles from Los Angeles, an easy drive of a day or so northward along the eastern base of continental America's loftiest mountains—a trip of varied picturesqueness and rare charm. From San Francisco the distance is about the same via the Yosemite Valley—also a route of grandeur. The nearest highway is the transcontinental National Roosevelt Midland Trail, almost direct from Montauk Point, Long Island, to the "postpile" and the Golden State's major cities. Two or three hours by trail, afoot or in the saddle, will take you from a resort called Mammoth to the weird, enchanted precincts of his satanic majesty's reputed post-setting or pile-driving operations. The spectacle is astonishing and inspires awe.

In the heart of hearts of the stupendous Sierra Nevada, surrounded by scores of white-robed peaks two and a half miles in the sky, residual glaciers, gorgeous lakes, dreamy meadows, boiling springs and ice-chilled, dashing brooks, the Devil's Postpile occupies the center of a region of magnificent scenery, more beautiful than the imagination can conceive or mere words describe. It seems a grim sentinel holding watch over the middle fork of the San Joaquin River, which noisily rushes by within a hundred yards. The curiously attractive and impressive prodigy is set at an elevation of 7,500 feet above sea level and is itself a pygmy as compared with the titanic heights all about. Nevertheless, even a prosaic visitor would give heed to naught else the first day or two. The one object enthralls.

The "pile" is a mile long, half as wide, and 400 feet high. The odd formation whence its appellation is derived is not everywhere in evidence, cropping out only in certain places. The most striking columns constitute more than 1,000 feet of its western face. They rise more than 100 feet above the talus—a vast heap of broken "posts" accumulated through the never-ceasing battering of the cliff by nature's processes. Ultimately all will be leveled in this agglomeration. How far downward they extend man knoweth not; it may be that they go far toward the heat-radiating center of the ball comprising our tiny share of the universe, but probably they pinch out close to the surface. The geological experts gladly would pay a liberal admittance fee for a peep under.

The columns in this amazing bluff are arranged in rows as regularly as the pipes of a cathedral organ. Almost perfect prisms, they are fitted together like cells in a honeycomb, each placed with the nicest care of true artisanship, and really look as if carved by human hands. The ends above were polished to a gloss by grinding glacial motion and may be compared with a parqueted floor. The mosaic effect is startling.

These columns range from 14 inches to more than three feet in diameter. Most of them are pentagonal, whereas elsewhere, as in the Giants' Causeway, the general shape is hexagonal. The Devil's Postpile affords strange deviation in this respect, some of its immense columns being eight-sided, many seven-sided, and the remainder hexagons. In one extensive section they are straight as sawed timbers and perpendicular. In another they lean and are gracefully curved *en masse* and the individual prisms twisted and fluted in the making or the cooling as sticks of pliable candy might be shaped. At one point they have the wavy appearance of flowing water. At the southern upper end they project almost horizontally and resemble gigantic railroad ties or evenly corded wood on a hillside. All the columns sparkle like precious stones in the glare of the mountain sun and the sight is bewildering. They are black in the main, but colorful withal, some in varying shades of green, blue and gray, a few white as alabaster.

For many years the handsomest of all the columns, tall and symmetrically tapered, was separated from the body and stood upright and alone, a proud, stalwart symbol of independence. It can clearly be seen in the upper center of the general view, but it is there no more. During my last visit to the postpile, last August, it was struck by lightning and fell with a reverberating crash, seared from end to end. Happily, it was broken into few sections, and the longest of these is shown in another picture.

It would be difficult to find a locality where more sudden and violent electrical storms come booming up. At midday, while the sun shone brightly, a small cumulo-nimbus cloud floated over the range from the west and in less than as many minutes three blue-white streaks darted earthward and each shivered a tree. The fourth and final bolt, with a peal that made the mountains themselves tremble, took the column. No raindrops pattered, scarcely a shadow appeared on the grand landscape. The lavatic formation, which has the metallic ring of iron and somewhat its hardness, may tend to draw electricity. At that altitude, eternally shut in by tremendous granite ramparts, the summer and lightning season is brief, the winter long and rigorous.

During the warm months the region is a fragrant paradise of bloom and birdsong, a medley of sweetest melody. The whole is a forest of pine, tamarack, fir and other sturdy trees, which cover even the postpile where the basalt is not actually bare. Wildflowers carpet the meadows and shaded places and sway breast high in the balmy air—thousands upon thousands of kinds, many of which grow here only. Few are more interesting than the squaw's carpet or mahala mat, a rich evergreen trailer that literally covers the ground with its foliage and feathery clusters of violet blossoms and later bears odd scarlet fruit. The botanist who does not go to the high Sierras misses more than he ever can realize.

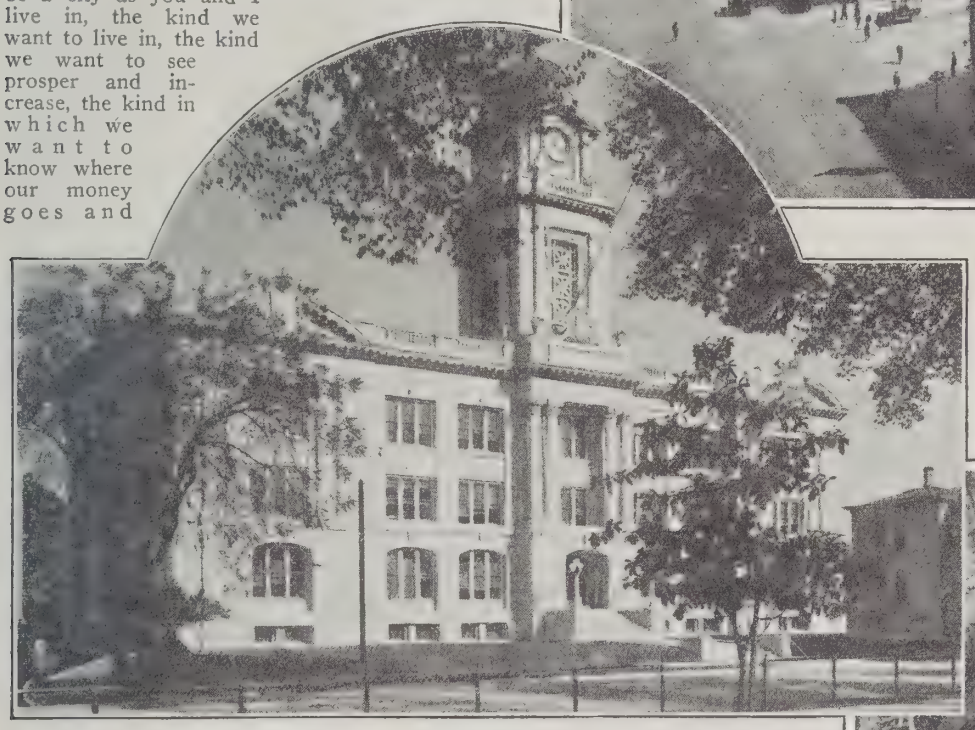
At the very upper edge of the crumbling cliff, where a "cornice" has formed, their roots fastened in the columnar jointing, a number of gnarled, torn, dwarfed cedars are hanging for dear life, even as dying humans cling to hope, the while their precarious support is tumbling away. This carries with it sufficient soil and pumice to afford a foothold in the talus below for lustrous quaking aspens, which spring up rapidly and shine as the breezes stir their leaves. A meadowsweet locally known as "postpile tea" and used by knowing mountaineers to make a palatable, refreshing beverage, also thrives amid the wreckage of the scintillant pillars. Above, where moisture comes from the lines of cleavage, delicate rock ferns and dainty mosses give a touch of softness to relieve the harsh glister of unyielding surfaces.

The Devil's Postpile is at the junction of important trails leading afar in various directions. Close by, the government has a log cabin that sometimes shelters storm-bound tourists. At times it is occupied by trappers, who bring out thousands of dollars' worth of furs. Big game and wild life abound.

Down stream two miles, and a part of the national monument, is Rainbow Fall, a gem unique and worthy of its name in that it literally is the birthplace of rainbows. The San Joaquin flings itself like a delicate curtain of lace and silver more than 100 feet over a ledge of black basalt—a continuation of the postpile, though without the columns—into an abysmal box canyon. When the sun's rays reach into the fairy box, rainbows arch the mists that flood the chasm—rainbows so clear that color photography registers them distinctly. The setting of this fall, in the bosom of the virgin forest and between exalted heights, is a masterpiece of nature, exquisite, sublime. There is not another elsewhere to match it. The picture lives in memory without fading as time rubs across it.

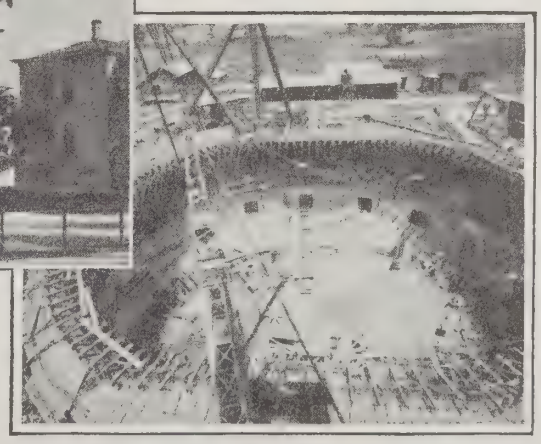
How a City Was Put on a Business Basis

By ROBERT MORGAN



THIS is a story of the manner in which a business management of a city, just like competent management in a factory or a store or on a farm, saves *you* money. It is a good story for those who always have voted the "straight ticket," "hated reformers," stood by "de ring," and helped one mayor or one set of councilmen to hold office year after year because they "had the experience." It is a good story for those—often the minority, sometimes the hopeless minority, though the right is never hopeless—who have stood out through weary years in the fight for clean city government, for the elimination of politics in municipal management, and for the selection of the best and most competent man, regardless of his political affiliations, as director of the destinies of any American city.

It is not a story of graft, dishonesty, crookedness or political preferment. It tells nothing of the misuse of the people's money, of your money and my money, in cleverly concealed "deals" to keep any man or any party of men in power. Back of it, behind the results shown, lies the tale of a battle, waged by what was once a minority, against entrenched politics and "pull," but that is another story, a story of conditions now dead, certainly dead, if, as some old Roman once said, "nothing is dead until it is buried." For that fight, the combination of conditions which brought it about, and the methods by which it was conducted, all are buried in forgetfulness, and none of the people want them dug up again. This is the story of a business management which, installed only six months ago, with only a small part of the 1921 income with which to work, found economic leaks, which, stopped, saved nearly $50,000 to the people of that city. It is the story of a business management, which, without "investigating" anyone, past or present, without going into any political graveyards, and without revealing any graft, uncovered a waste of approximately $125,000 in the annual budget, and cut that much from the 1922 expenses of operating the city. It is a story of a city management, which, notwithstanding these reductions, is giving the city better government, better law-enforcement, better street improvements, better educational facilities, and is taking over public utilities for the benefit of the city, with moneys saved *over and beyond the large reductions already mentioned.*



It is, in brief, the story of Sacramento, capital of California, a city of about 66,000 inhabitants, approximately the same size and kind of a city as you and I live in, the kind we want to live in, the kind we want to see prosper and increase, the kind in which we want to know where our money goes and how we can get more for that money—Our Own Home Town. It reveals the waste which permeated virtually every department of city government, a loss of the taxpayers' money due more to the system of government than to any individual, and it shows, with remarkable clarity for an economic experiment, the methods by which the avenues of waste down which the people's money went were discovered, and how the "Closed Street" sign was put permanently across these highways of loss.

Business district of Sacramento, capital of California, which has proved the city manager plan of government to be an economic, financial and political success.

The city hall at Sacramento, a city of approximately 66,000 inhabitants, which has adopted the city manager form of government and is highly pleased with the results.

Section of the new filtration plant, now under construction in Sacramento, which that city has been enabled to build, along with a number of other improvements, through the savings accomplished by the city manager form of government.

As a result of the city manager system, it will cost exactly $123,281.88 less to operate the municipal machinery in Sacramento in 1922 than it did in 1921, and, by the same means, it cost $46,178 less to run the city in 1921 than it did in 1920, though the city manager method has been in force only since July 1, the beginning of the fiscal year of 1921-22. This means that $169,459.88 has been saved to the 66,000 inhabitants of Sacramento, an average of $2.57 for every man, woman and child in the city. If there are 20,000 taxpayers in Sacramento, which probably is an excessive estimate, they have saved approximately $8.50 each on their taxation for the first 18 months of operation of the city manager plan. It is small wonder that the voters of the California capital, recently questioned by one of the newspapers of the city, replied with unanimous voice in favor of the city managership.

As a result of this saving, not only has the tax rate been reduced, but the assessments also have been reduced, and a plan is now being formulated whereby 100 per cent assessment valuations will be made, which will still further reduce the rate, and more equitably distribute the taxation. Steps have been taken looking to the establishment of a municipally-owned hydro-electric plant, the second of its kind in the state, and more improvement work is now under way in Sacramento than at any time within the past five years.

Clyde Seavey is city manager of Sacramento. His forehead tells you that he can think; his jaw indicates that he can fight. He has done both with equal willingness and equal success. In fact, at the end of each bout, the referee, that is to say, the people of Sacramento, held up the Seavey right hand, as the sign of victory. Seavey is not the only city manager in the world, just as Sacramento is not the only city which has tried out the plan and found it successful, but he is one whose methods have been followed by results, so that they are well worth watching and studying by other people in other American cities. Besides Seavey, there is a city council of nine members, composing the legislative department, as he is the head of the executive department. Cities which have adopted or do adopt city manager methods of government also can have mayors if they want them, but as the city manager's first job is to lock the pie counter and throw the key into the nearest lake, not many men are noticeable by their desire to become mayors of city-managed municipalities.

Seavey was put into office as city manager on July 1, 1921. As soon as he knew he was to take charge of the city, which was some weeks prior to his actual taking hold, he hired an expert to make a detailed and minute survey of the old city government. The old and the new charters were analyzed, and ways of consolidation of departments and elimination of "deadwood" were studied. Then, on the night of June 30, the new city manager, the men he had picked for his aides, and the new city councilmen sat down together as darkness fell and wrestled with the problem until dawn of July 1. Then they went home, explained where they had been to friendly wives, washed their faces, strolled down to the city hall, and put the plans of the night into effect the first day.

Some people who had long been connected with the city of Sacramento were considerably surprised. Salaries totaling $80,418 were eliminated immediately. A number of men who had waxed rotund on the city pay roll went to bed in June under the beneficent protection of healthy salaries, and woke up in July with less pay coming to them than the kaiser could draw in Paris. One new man, on the average, was put in where two had drawn pay before, so that the new salary roll totaled $34,240. This left a net saving in salaries of $46,178. In the engineering department alone, about $20,000 was saved on the salary roll, by the simple adoption of the perfectly clear motto, "a day's work for a day's pay." Proportionate reduction and saving was made in the city health department, and in the finance department enough lost motion was picked up to slice $8,000 from the pay roll.

CLYDE SEAVEY,
City manager of Sacramento, who has worked valuable reforms in finances, taxation, operation and other features of government in the capital of California.

Other savings were made by consolidation of offices, avoidance of duplication, elimination of time lost, systematization of the amount of work to be accomplished by each employe each day, and centralization of management. The immediate result of this has been, not only a saving in money, but greatly increased convenience for the public. All offices with which the public ordinarily deals, such as water charges, tax collections, water tap permits, building permits, electrical installation permits, business licenses, garbage collections, and similar necessities of everyday life, have been put in one large office on the first floor of the city hall. Formerly, the man or woman who had business with more than one of these departments, was compelled to travel over three floors, and enter at least half a dozen offices, before he or she could obtain the service for which he or she paid.

These changes were put into effect the first day, without friction, and without delay, so carefully and so thoroughly had they been worked out before the new forces took office. The best thing about the new system of city government is that it is working even better in practice than it promised to work in theory. As soon as it was seen that the change was going to be a success, work was begun on the 1922 budget. The finance department, of which H. C. Bottorff is the head, discovered that former budgets gave no adequate basis on which to work. Then Bottorff took his pen in hand and analyzed each and every expenditure for 1920 and the first half of 1921, to establish an entirely new and sound basis for the future. A chart, showing every expenditure in detail was prepared. Department hearings were held for each division of the city government. When the budget finally was drawn, it showed a net reduction in operating costs for the year 1922 of $123,281.88.

In spite of this reduction, added to which was another cut due to lowering of assessed valuations, money for permanent work was provided, as well as for new enterprises, new equipment, and increased salaries for policemen and firemen. An appropriation of $15,000 was put into the 1922 budget for development of plans and surveys for a hydro-electric plant for Sacramento, which is the second city in the state—Los Angeles being the first—to take definite steps for municipal hydro-electric development. From the 1921 appropriation, Seavey and Bottorff managed to save enough money

(Concluded on page 15)

From Bryan's 16-to-1 to the Federal Reserve

Taking Over of Washington by the Financial Interests Concluded from page 9.

Riggs National Bank, always the bank par excellence of the capital, found a close competitor in the Commercial National Bank, a block away, whose sudden jump to the fore was marked by the advent in its employ—later "rising" to the presidency of the institution—of a Bolling, a very close relative of the second Mrs. Wilson. To follow up the changes of directorate and management of the Commercial National Bank during the years 1916-1921 is like wading through a small-town directory.

The Commercial National Bank of Washington, however, rich as it was becoming at this period, never could displace the Riggs. The Riggs remained the Washington bank of the New York bankers. If the New York bankers found it necessary to play in the hands of the Treasury Department—as they often had occasion to do—they did it by indirect means. They did not use the Commercial National Bank, because somehow it had all the earmarks of a provincial bank. That was fatal, in the eyes of aristocratic New Yorkers.

Controller Williams, early in his incumbency, had the good fortune to enlist on his side Frank A. Munsey, one of the powerful publishers and although not one of the inner metropolitan ring he is at least in it. During the crash of a bank under the shadow of the Post Office Department, Controller Williams called the Munsey Trust Company into the breach, and as the Munsey Trust Company was a newcomer, and was having a hard time of it, this official recognition was a kick in the right direction, and Mr. Munsey never forgets his friends. The result was that the powerful Munsey newspapers, hard as they were on the Wilson Administration and on most of its individuals, were very friendly to Mr. Williams—and justifiably so. It was the realization of this strong newspaper support that gave Mr. Williams the strength within the Treasury Department that so often puzzled observers. And when Mr. Munsey took over the New York *Herald* he added another bit of armor and rendered Controller Williams well-nigh invulnerable from political or financial attack, inside or outside.

Why the Controller Remained

AS FAR as the writer knows, the Munsey newspapers never found it necessary to go out of their way to "carry on" for Controller Williams. But they were ready, of course, to publish anything that the Controller of the Currency might have to say, even if other newspapers in Washington and New York and Chicago were minded to print half a stick where least visible. Controller Williams, on the other hand, never found it necessary to seek the special support of the Munsey newspapers. It was the realization by certain individuals that they could not shut off this powerful group of conservative newspapers, as distinguished from the sensational newspapers, that prevented their demanding John Skelton Williams' scalp, much as they desired it.

Those conversant with the gossip of the Treasury Department knew for some time that there was no love lost between Controller Williams and Governor Harding. It was a feud that probably antedated Secretary McAdoo's resignation, but the latter's abandonment of public office hastened the breach. Secretary Glass sided with the Federal Reserve Board, which meant against Mr. Williams, even though the latter was his ex-officio colleague thereon. There could be no other explanation for Senator Glass' present attitude toward the former controller, in the Senate and out of it.

But to show, after a necessary digression, how men adapt themselves, it is worth while tracing Governor Harding's metamorphosis, and the obvious lesson that can be taken from it. It is not so very many years since he was appointed a member of the Federal Reserve Board by President Wilson—a southerner who was looked upon to champion agricultural interests south of Mason and Dixon line in the same measure that his colleagues would champion other interests. In those days there was no such thing—not officially, anyhow—as a southern Republican, and had one been found he would hardly have been selected, since a northern Democrat would have served the purpose of the Wilson Administration much better.

Yet today Governor Harding is trying his very best to appear such a Republican, and for two years has been jockeying for the favor of his namesake in the White House. Governor Harding wants to remain where he is, little realizing that President Harding has exceeded his good political judgment in permitting the former to remain at the head of the board until now. There are those, however, who profess to see in this the hand of Andrew W. Mellon, Secretary of the Treasury, who knows a good fiscal servant when he sees one.

It would be too much, politically speaking, to expect President Harding actually to reappoint W. P. G. next August, when the latter's term expires, but these days politics is making some strange bedfellows and the surprises to come, still politically speaking, may be many and wonderful.

The breath of Wall Street was evidently very sweet for Member Harding. First the incantations of Paul Warburg, and now the ministrations of Governor Benjamin Strong of the New York Federal Reserve Bank, wove the spell. Governor Strong is one of the powerful members of the Morgan-Rockefeller-Kuhn-Loeb money ring. Governor Strong undoubtedly will exercise no little influence in the coming appointment, be this what it be, since it is common gossip that Secretary Mellon is unusually good-natured about appointments under the control of the Treasury Department. All he asks is that they be "safe" men. By that he means conservative. By conservative he means amenable. Secretary Mellon is too old to stand much excitement, and moreover he is too fastidious; he would not like to see the hallowed (if musty) corridors of the Treasury Building desecrated by the footsteps of radical financiers.

The report in down-town New York is that Governor Strong—and Governor Strong means the invisible powers that be—would rather have a regular board—regular in a political sense—and therefore would like to see a Republican in Harding's place. But the question is in finding a Republican who will not change the present route, and for this reason gossip fixes the name of John R. Mitchell in line for the succession. Mr. Mitchell is the newest member of the board. Of course, his chances in this will depend upon his antecedents and the circumstances that led to his present job.

Follows the President's Lead

BUT apart from the question of the identity of the next governor of the board, the thing to bear in mind is the fact that Governor Harding wants the job under a Republican President and for months has engineered his attitude accordingly. Whether President Harding can stomach that one act alone remains to be seen. Moreover, Governor Harding aligned himself, according to declarations made in the Senate, on the Warren G. Harding side as soon as the latter was nominated and again as soon as he was elected. Mere words, however, would be insufficient to assure the new President that Governor Harding was in earnest, so, in response to the resolution of May 17, 1920 (objected to by Senator Owen as meaning deflation and depression), he advised the Senate in part as follows:

> **The board will not hesitate, so far as it may be necessary, to bring to bear all its statutory powers in regulating the volume of credits.**

Shortly afterward the Federal Reserve Board began its squeezing process, and subsequent developments have shown that Senator Owen's prediction was reliable. But standing up and taking the gaff is another story, and those who know Governor Harding realize that he does not like punishment. Therefore, he proceeded at once to extricate himself, as far as he could, from the annoying charges that he brought about the woeful conditions of 1920-1921. The Federal Reserve Board could do no wrong, in his opinion. *At once word went forth that the "country bankers" were responsible for what happened to the farmers!*

The astounding character of this alibi lay in the fact that the country bankers could not, in their own defense, stand up and say something to the governor of the board and say it as they thought it. It might mean ruin or very nearly that. The Federal Reserve Board could virtually *break any banker* who felt hypercritical. It is a variation of the political squeeze that will probably be adopted at the congressional elections next November. The little banker who, from civic duty and pride, feels that he must identify himself with a given political movement, if that movement happens to be against the wishes of the Federal Reserve Board, may as well fold his tent and depart in peace.

Almost 10 years ago Governor Woodrow Wilson, of New Jersey, said that this was *"no longer a government of free opinion; no longer a government by conviction and the vote of the majority, but a government by the opinion and duress of a small group of dominant men."* It may be that he had in mind the group of Hanna-Quay type bosses, but as he had often alluded to the Wall Street group in almost identical phraseology, one may take it that he meant both groups or a group covering both factions. Little dreamed he that in selecting W. P. G. Harding for the Federal Reserve Board he would perpetuate the very thing against which Wilson dedicated himself.

How else can one explain the activity of the Federal Reserve Board in politics, of which complaint was made on the floor of the Senate recently, without adequate explanation from the board? Under what privilege is the Federal Reserve Bank of Atlanta indulging in political propaganda?

The charge made in the Senate was in part as follows:

> ". . . . The officials of this bank wrote a letter with that speech calling upon the local banker to read that speech, calling upon him to write them the impression that he had about the subject before he read the speech, and calling upon him to write them his opinion after he read the speech." The speech in question was one made by Senator Carter Glass defending the Federal Reserve Board and its policies to date.

What could any banker, especially the average small-town banker, reply under such peremptory conditions coming from such a source? No matter what he thought *before* or *after* reading the speech, discretion was limited. In other words, presuming that every banker would reply to that catechism, the Federal Reserve Bank of Atlanta would have a tabloid record of the opinions of each member banker. What can one deduce from any such inquisitional procedure as that? And can it be believed that the Atlanta bank went ahead and spent funds at the direction of Federal Government officials to spread political propaganda, especially in the South, and within Governor Harding's own territory at that, without the latter's knowledge?

It is obvious that the Federal Reserve System, so utterly contested at the outset by metropolitan financiers, and then captured by them, has in their hands become a sort of clearing house undreamed of in the "good old days" before 1912. It is an easy matter for New York to influence politics in any section of the United States through the various Federal Reserve banks, and needless to say with a Secretary of the Treasury that is one of the inner ring, and practically owning the Federal Reserve Board, almost anything may be expected.

This is the way the financial question has gone on since it was "settled" by the campaign of 1896.

Monster Maelstroms on Sun Cause Storms Concluded from page 2

of earth, moving forward as a body, at a comparatively slow rate.

"These disturbances on the sun, beginning as maelstroms of unconsumed matter thrown out from the interior of the blazing globe, become cyclonic storms of a magnitude almost incomprehensible to the mind of man, when they enter the atmosphere of metallic vapor or gases which surround the sun. Bursting through this envelope of terrifically heated vapor, they set the adjacent parts of the ether into motion, spirally, and in the same direction; that is to say, counter to the direction in which the hands of a clock move. These areas of ether closest to the gaseous envelope of the sun, then set in motion, similarly, other adjacent parts of the ether, and so an ever-extending motion, filled with the great electric power generated in the mass of the sun, passes through the ether and reaches the earth, when these sunspots cross that line which passes through the center of the sun and the center of the earth, called the Central Meridian.

"This whirling motion is imparted most powerfully to the atmosphere of the earth at points where the attraction is the greatest, and this attraction is the greatest over the Aleutian Archipelago, and again at an undetermined but well-known point in the Caribbean Sea. Hence the fact that our storms originate in one or the other of these two areas, and rush together.

"In regard to high barometric areas, and the consequent 'good weather,' observation by myself, and, to a lesser degree, by others, has shown that the arrival of these periods of clear weather over the Pacific Slope region coincides with the arrival of sunspots in the *southern* hemisphere of the sun, and the passage of these 'flocks' of sunspots across the Central Meridian of the sun. These spots in the southern hemisphere whirl with the hands of the clock, instead of against them, as do the spots in the northern hemisphere.

"I have used the word 'attraction' in this discussion, because the whole underlying force of the storms—both those which result in sunspots on the sun, the resulting activity of the sunspots on the atmosphere of the earth—is an effect of electro-magnetism as between the sun, the source of all energy in this solar system, and the earth, or any other planet in our system, controlled by the sun."

Closing "For Repairs" and Calling the Police Concluded from page 3

Stocks and bonds of the Denver & Rio Grande, which were thus *either wiped out or exchanged for new securities one-half their value*, were in the treasuries of 22 public institutions in which were deposited the people's savings, to the amount of $1,124,480. The list is as follows:

Five savings banks in New Hampshire.
Five fire insurance companies in New York.
One fire insurance company in Rhode Island.
Four trust companies in New Jersey.
Three trust companies in New Hampshire.
Three trust companies in Pennsylvania.
One trust company in New York.

The total of the two Denver bond issues whose value is reduced 50 per cent under the reorganization plan aggregates $36,500,000, indicating a loss to the investors of some $18,000,000.

Of the stocks of the Denver & Rio Grande, there were listed $61,000,000 worth on the New York Stock Exchange, representing the amount in the hands of the public. Just before the collapse of the property, Wall Street was the field of wild rumors in these stocks. Those men in the Street who "were in on the know," quietly unloaded their holdings in the preferred at $52 and in the common at $23 a share. Quotations of Denver & Rio Grande shares thereafter slowly subsided in value, until August 25, 1921. The common had sold down to 50 cents and the preferred to $1.00 for a $100 par value share. At such prices, the brokers can no longer make any profit in their transactions. There was only one result to be expected. On the previously mentioned date, the New York Stock Exchange made an official announcement that the common and preferred stocks of the Denver & Rio Grande Railroad had been *stricken from the list.* The Denver stocks had been milked dry. They were now thrown out of the Exchange as a spider casts out from its web the empty husk of a fly it has devoured.

Denver & Rio Grande preferred stock is now knocking about the Curb at the price of 30 to 50 cents a share. A protective committee in this stock is still in existence, trying to obtain some more equitable treatment from the Western Pacific interests.

Such is the inevitable result when banking groups battle with one another in Wall Street. The public foots the bill.

Why the Farmer Opposes the Grain Exchange

He Believes It Is Used to Manipulate Prices at His Expense

By EARL CHRISTMAS

FARMERS have made frequent protest against the system through which they must market their wheat. Different practices of the grain exchanges have stirred them to revolt. But nothing connected with the whole system has aroused such discussion as the excessive speculation that is carried on in grain "futures."

A "future," as the term is generally used, is a contract for the purchase and sale of grain to be delivered during some future month. The agreement specifies the time and the price, but payment, as well as delivery, is postponed.

The man who sells the future may not have the grain which he agrees to deliver. He may never have the actual grain. He may think that the market is going to fall before the time for delivery and expect to buy another future, or contract for wheat, at a cheaper price, and thus reap a profit in balancing the two transactions. In other words, he is speculating from day to day on the future price of wheat. Trading in these futures may begin months before the harvest, often long before the crop is planted even. Settlements are made by the payment of differences when the time for delivery arrives.

The future market is used also as a protective measure. Since the price of cash grain and the price of the future usually rise and fall together, dealers when making cash purchases or sales protect themselves by simultaneous future transactions on the other side of the market. This is called "hedging."

A country elevator may buy 5,000 bushels of wheat one day at the market price for that day. Before it can get that grain sold on the Minneapolis market, however, the price may be 10 cents lower, or even more. To guard against that, the elevator man, when he makes his day's purchase, wires to his broker in Minneapolis to sell 5,000 bushels of futures. When his actual grain arrives at the market some time later, he also closes out the future transaction by buying 5,000 bushels in other futures to satisfy his earlier contract.

If the market has risen, the elevator man has made money on his cash wheat, and lost on his futures. If the price has fallen, he has lost on his cash transaction, but he has made money on the future transaction. In any event, the gain on one usually just about balances the loss on the other. The "hedge" thus acts as a kind of insurance. The dealers at the terminal and the millers use the same plan of hedging their purchases.

But hedging forms a small part of the trading in futures. How extensive speculation on the grain exchanges is, has been the subject of much discussion. It reaches sums that are astounding to those unfamiliar with the practice of the "pit." The Federal Trade Commission, after a study of the 1914 revenue tax on futures, determined that the trading in grain futures for the average year for the Chicago Board of Trade was 18,414,000,000 bushels. L. F. Gates, former president of the Chicago Board of Trade, and Professor James E. Boyle, of Cornell University, who made a study of the question, put the number at 20,000,000,000 bushels.

The amount of actual grain shipped into the Chicago market is about 325,000,000 bushels a year. In other words, the number of bushels of futures dealt in on the Chicago market is 51 times as great as the number of bushels of grain received. Half this trading is in wheat. In this Chicago pit—just a little bit of space filled with gesticulating and shouting men—three times as much wheat is bought and sold on these futures as is produced in the whole world. The average yearly receipts of wheat at Chicago do not exceed 65,000,000 bushels. Yet at least 10,000,000,000 bushels are bought and sold in the pit. Deliveries are rarely made on the contracts. Some traders have estimated the actual deliveries of wheat at less than one per cent.

Minneapolis is a greater cash wheat market than Chicago, but trading in futures is much smaller, amounting to about 1,400,000,000 bushels a year, according to the Federal Trade Commission. The great futures market is centered in the Chicago pit.

We have the statement of Senator Arthur Capper's paper that "it is becoming more and more evident that the grain pit of the Chicago Board of Trade is the most colossal gambling hell the world has ever known." Senator Capper says the 1920 corn crop was sold 14 times over before it was marketed, that farmers lost millions and the "lambs" who played the game lost other millions.

Commissions on cash sales do not pay the admitted expenses of the big commission houses. One Chicago house, reported by the Federal Trade Commission, received $37,000 in commissions on cash grain sales in 1916 and $1,330,000 in commissions on future transactions. Even on the conservative figures of Professor Boyle, commissions on these future trades in the Chicago pit amount to $12,500,000 a year, while no accurate estimates of the winnings of the speculators have been possible, though vast sums must be involved when 20,000,000,000 bushels of grain are bought and sold in a year.

Over private wires, the Chicago houses send out their "gossip" to the branch houses all over the country. Says the Federal Trade Commission's report: "Much that is sent over the wires is of the nature of rumor, some is doubtless sheer invention, and often dishonest invention to influence prices to one's advantage." Sometimes there is advice as to the time to buy.

Vast fortunes have been made and lost in grain speculation. The private wire systems have put more than 200 cities in direct, daily contact with the pit, and increasing numbers are being induced to play the market. Twenty billions of bushels of wheat—even the commissions on this phantom grain amount to more than $12,000,000 a year at the most conservative figures!

Presence of St. Anthony Falls determined that Minneapolis should become the great flour milling center of the country. Today the flour mills represent Minneapolis' biggest industry; they constitute the prime factor in the big grain market centered in the Chamber of Commerce there.

Now, who pays the toll? Why is this speculation tolerated?

That question has brought out, according to many observers, the fact that even the ills of speculation are not unmixed with good. Whether the evils overbalance the good—well, that depends upon on which side of the fence you happen to be.

The theory of the grain exchange is that future trading takes up the risk in handling grain, and serves to lower the margin between the producer and the miller. This also is the view of many economists. The speculator steps in when there is a lessened demand from the miller, and buys the wheat, carrying it until the miller needs it. In other words, he takes up the slack, and tends to stabilize the market.

If the country elevator could not "hedge" its purchase, the grain exchange man says, the elevator man would find himself faced with the risk that the wheat price might drop before he could get his purchase to market. He sells a future, and he is protected. In other words, there is a certain risk in handling grain, and the speculator simply assumes the risk.

If the country elevator man did not have this insurance, he would have to take a wider margin of profit to be safe, according to the proponents of future trading. So would the commission merchant. So would the miller have to have a wider margin.

The cost of the system falls partly on the speculators and partly on the producer, say observers, though Professor Boyle insists the cost of the insurance to the grower is negligible compared to the benefits derived. Farmers will not agree with this, however.

But such in substance is the theory that so far has sustained future selling. A good many farmers appreciate the advantage in hedging. About half the co-operative elevators follow the practice, feeling it is a necessary safeguard at present. On the other hand, a very large number of farmers are against all future selling, and point out that hedging is needed only as a protection from the manipulations of the speculators. Orderly movement of the farmers' crops to market is the only stabilizer needed, they say.

Manipulation—that is the weak point in the case of proponents of future selling. Farmers in increasing numbers feel that the machinery of the grain exchange is used by the speculators to force down the price of wheat while the farmer has it to sell, and then to raise it after he sells.

Professor Boyle and the economists are apt to say that supply and demand determine the price of wheat. But the farmers are not convinced. J. M. Anderson, president of the Equity Co-operative Exchange, and Mr. Drake, its attorney, say that within certain limits imposed by the law of supply and demand, the speculators can raise or lower the price of wheat at will.

On the morning of January 21, 1921, all the market news was optimistic. It was reported that the Armour interests began selling large holdings of March wheat. In three hours, the price of March wheat dropped more than six cents in Chicago, and 13 cents in Minneapolis. And, the government report adds, cash prices declined more than futures!

Dissatisfaction of the farmers over this kind of thing forced a future trading act through Congress last year. It placed grain exchanges under the supervision of the Secretary of Agriculture, and abolished privileges, one form of future selling. A privilege amounts to an option to buy or sell a future. Trading in futures proper will continue, however. The act also provided that co-operative marketing organizations must be admitted to the grain exchanges. Action brought in the courts by the grain interests in an effort to defeat this law is pending now.

Distrust of the grain exchange has led to plans of the farmers to do their own selling in the market places. The United States Grain Growers, Incorporated, latest venture along this line, already has 35,000 members and a crop of 90,000,000 bushels pledged to a farmer-marketing agency. In fact, the growth of the whole co-operative movement in the grain industry bears witness to the dissatisfaction of the farmers over the grain marketing machinery.

The farmers' elevator movement began soon after 1900. The appearance of the co-operative elevator raised the price of grain several cents a bushel in its locality. But the co-operative elevators encountered open warfare on the part of the grain dealers, particularly in the Chicago territory. Commission houses which handled grain from the farmers' elevators were boycotted by regular shippers. But the farmers' elevators, growing to more than 5,000 in number and handling a greater proportion of the crop, soon became so powerful that this practice had to be abandoned. But the grain exchange still remains virtually a closed corporation as far as the co-operative elevator is concerned. Another stage in the battle is now at hand. The co-operative movement is knocking at the door of the grain exchange.

The co-operative organizations haven't been received with open arms at the grain exchanges. Evidence presented at a hearing conducted by the Minnesota legislature showed how the Minnesota Farmers' Exchange, a co-operative organization, came to grief when it tried to sell on the Minneapolis Chamber of Commerce. It bought a membership for $4,200, but the board of directors refused to approve of its membership.

The company then had to sell through a commission house. One day, when it had 12 cars of wheat belonging to these farmers, this house failed, and another commission house, a creditor of the first, got the 12 cars of wheat. The farmers lost their grain, valued at $12,000. They appealed to the Chamber of Commerce, but could not obtain satisfaction, and the company was wrecked.

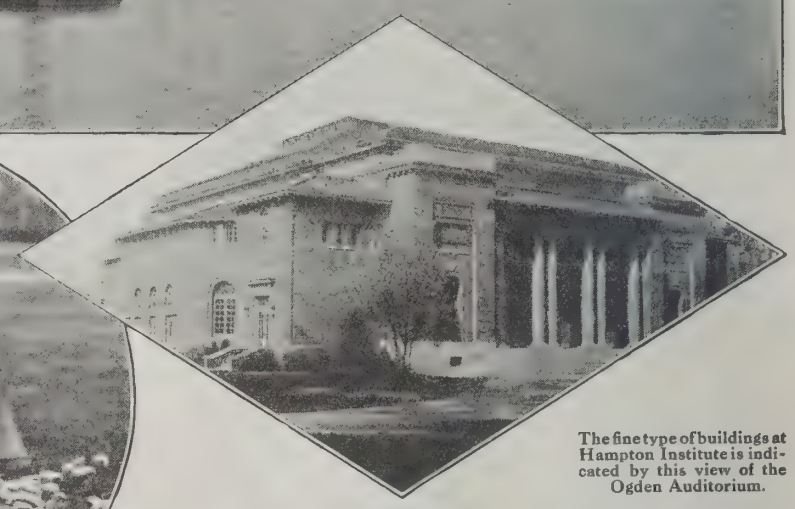
Then, there is the Equity Co-operative Exchange. The Equity owns and operates a big terminal elevator in St. Paul and a line of country elevators in Minnesota, North and South Dakota, and in addition handles grain and live stock for members and patrons on a commission basis. It has a paid-up capital of $1,000,000, more than 21,000 stockholders, and 400,000 active patrons, according to J. M. Anderson, its president. The Equity Exchange does a yearly business of more than $30,000,000.

Yet the Equity Co-operative Exchange, serving these thousands of farmers, can't sell a bushel of wheat on the Chamber of Commerce of Minneapolis. In fact, with other interests, the Equity has established in St. Paul a rival grain exchange, incidentally the only open exchange in the country. However, this exchange and the co-operative company have encountered bitter opposition on the part of the Minneapolis Chamber of Commerce.

The Equity appealed to the Federal Trade Commission, and the commission issued a complaint, charging the Minneapolis Chamber of Commerce with using unfair methods and attempting to destroy the Equity Co-operative Exchange. The appeal of the Equity Co-operative Exchange was made to the Federal Trade Commission in April, 1917. The complaint of the commission, made after an extensive investigation, was issued three and a half years later. Since that time other delays have interposed, and hearing on the complaint is yet to be held.

The nominal reason of the grain exchange for wishing to exclude co-operative marketing organizations lies in the old rule against rebates. The exchange contends that when a co-operative turns back its earnings as a patronage dividend, that is rebating. The exchanges have a uniform commission rule. The more obvious objection, however, is that the co-operative agency, by selling at cost, will get a large share of the business, and drive off the market many of the men who make their living trading in grain.

Hampton Institute—Fifty Years of Uplift



College Has Equipped 10,000 Poor Colored Boys and Girls With an Education That Helps Themselves and Their Race

Hampton Institute is like a great university, stretching along the Hampton River and within sight of the spot where the Monitor and the Merrimac fought their historic battle.

Hampton Institute owns a farm of 850 acres, which serves as the center for extension work among the colored people of the South.

The fine type of buildings at Hampton Institute is indicated by this view of the Ogden Auditorium.

The selection of live seed is taught Hampton Institute boys, who in turn carry to their people the message of safe farming.

BOOKER T. WASHINGTON came to Hampton Institute a poor, ignorant colored boy and became the most distinguished member of the colored race of his generation.

Robert R. Moton, who succeeded Booker Washington as the principal of Tuskegee Institute, and who is perhaps the most eminent colored leader in the United States, came from Hampton.

The writer had often asked himself just what sort of an institution this is that has taken 10,000 boys and girls of the colored race, without money and without price, and given them a real start in the world.

And so when the opportunity presented itself, he found himself on a river steamboat slipping down the Potomac River and out into Chesapeake Bay. Seven o'clock the evening before had seen the lights of the city of Washington fading from view; Alexandria had been passed and in the brilliant moonlight one made out the dim outlines of Mount Vernon, Fort Washington, and the old plantation houses that still line the Potomac. Early the next morning the boat discharged its passengers at Old Point Comfort, and in the half twilight one hurried past the moat and gray battlements of historic Fortress Monroe. A brisk walk brought the writer two miles through the little village of Phoebus, to the outskirts of the city of Hampton and to the gates of Hampton Institute.

This is the setting of Hampton Institute—its wide acres stretch down to Hampton River and one looks out over Hampton Roads, where the battle of the Monitor and the Merrimac was fought in Civil War days. The old plantation house still remains, but now marvelously remolded and the home of the principal of the school.

Hampton Institute is really the Harvard University of thousands of colored people the country over. To be a graduate of Hampton is indeed a coveted honor. Its buildings, too, resemble those of our great eastern colleges. Many of them, now covered with ivy, bring back the traditions of nearly half a century, when the brick for those same buildings was made from native clay on the school grounds by student labor. But now new buildings have come, great dormitories, and auditoriums, and lecture halls. It is like a great university, as one walks along the lanes.

Hampton Institute probably has given more poor boys and girls an education than any other institution in the United States. For 50 years now it has been "loaning" education to boys and girls of the colored race from every section of the great South. That is exactly what Hampton does. It "loans" educations. The students are not expected to pay back in after life the dollar value of what it has done for them, but they are expected to pay back the cost of their educations by practical service to their own communities and country, just as Booker T. Washington and Robert R. Moton have so distinctively done. And this institution today has hundreds of its graduates acting as demonstration agents, agricultural and home economic workers, teachers, and farmers and in business for themselves throughout the South. It is the same Hampton Institute that sells pure-bred hogs for $10, when they would bring $75 at the fancy sales held by breeders, simply to give the most humble farmer a chance to build up his live stock and to improve the live stock of the South generally. Besides its campus of 100 acres, adjoining the town of Hampton, the institute has a great farm of 850 acres.

Hampton Institute is a practical sort of school, that, in the language of one of the members of its faculty, "mixes brains with work." It means to be practical, to teach a great number of everyday things that will help a man or woman make a better living rather than simply an academic course to round off one's general culture. So one might say that it teaches everything from poetry to poultry. Perhaps it may better be said that each student learns to do some particular things decidedly well, and at the same time receives a liberal amount of general education. Today there are 1,800 students, virtually all of whom are earning the greater part of the money to defray their own expenses. There are 140 buildings all told.

As one walks about the buildings and grounds of this school of practical everyday living, one gathers that there must have been some great men, full of inspiration, who conceived the idea of such a school and carried it into successful execution. Go back 50 years and one sees General Samuel Armstrong, in the days following the Civil War, gathering about him 15 students, colored boys and girls from the country around Fortress Monroe. In those days the colored people had not conceived of their new liberty. To many it meant freedom from work, and the making of a living had not yet entered their minds. Armstrong had been a student at Williams College and had become a close friend of Mark Hopkins.

With sublime faith in his plan of free education, Armstrong step by step built that school. In the early '70's he decided that a girls' dormitory was needed. There was just $2,000 available. The cost of the needed building was estimated at $100,000. "All right, dig the hole and pile the bricks and lumber around," said General Armstrong to a friend. "We'll make it so interesting that people will be only too glad to give us the money."

Virginia Hall, as it was called, was "sung up" by the students, General Armstrong going North with his party of picked musicians from among the students of the school. He gave concerts everywhere, the Hampton singers became popular, and thousands of dollars rolled in through the box office. A few years later this building was thrown open to use. Even today Virginia Hall, with its ivy-covered walls, is a popular building, serving as the big central dining hall and one of the girls' dormitories.

There have been just three principals of Hampton Institute in its entire half century of usefulness. After his graduation from Yale University and the Union Theological Seminary came Hollis Burke Frissell to Hampton as chaplain, serving as chaplain and later as principal for nearly 40 years. The present head of the school is Dr. James Edward Gregg, with degrees from both Harvard and Yale.

Most of the students who come to Hampton have virtually no money. Board and room at Hampton Institute cost only $15 a month, which includes modern accommodations and laundry thrown in for good measure. Tuition costs $100 a year, but by means of endowment funds which have been given to Hampton, from time to time, there always are free scholarships. So the book learning really costs the student nothing.

Entrance to Hampton presupposes some general education, at least sufficient to enable one to take up some particular line of work. For those students who have no money, but yet have the makings of a success in them, there is "Shellbanks," the farm of 850 acres owned by the school.

Here the student is permitted to work a year, doing a small amount of studying at the same time, and to accumulate sufficient funds to give him a good start

at the school. Everybody works at Hampton, and for everything that a student does he receives pay. This is credited to him regularly and it goes to meet the cost of board, room and clothes. It is probable that there never was a student at Hampton who had enough money to pay his way through school without work.

When Booker Washington heard of Hampton Institute he was working in a mine. Walking a large part of the way to Hampton, sleeping under a wooden sidewalk at Richmond en route and loading pig iron on a ship to earn a little money, he finally arrived at the institute. But he had no training to begin with and could scarcely have mastered the most elementary work the institute had to offer. But he passed an entrance examination by so carefully dusting a room that the teacher remarked that anyone who could dust a room so well must have something worth while in him.

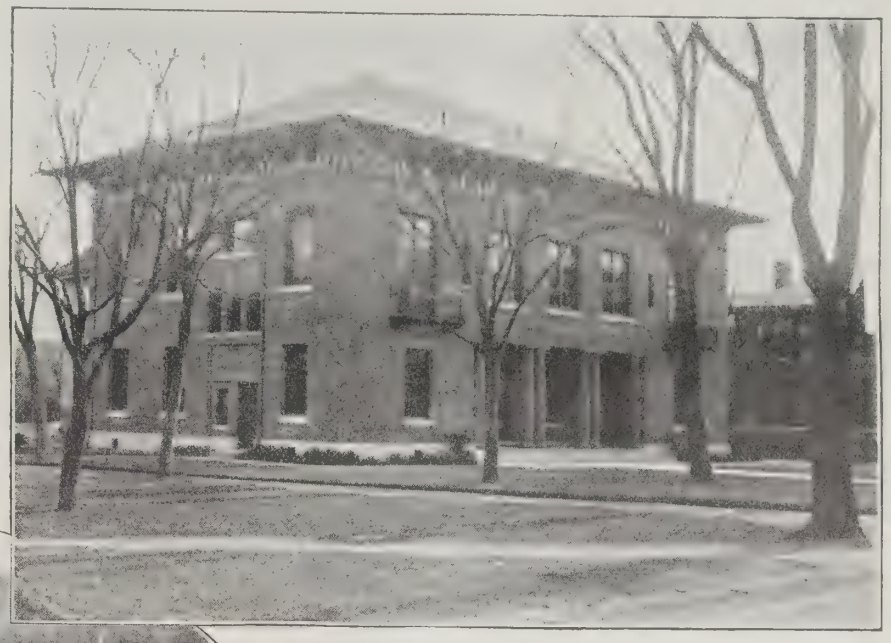
There probably is no school that offers such an array of practical courses as does Hampton Institute. First comes the normal school. Here there is a course of two years based on four years of secondary school work.

Then there is the agricultural school, offering a collegiate course of three years of 12 months each, based on a high school course of four years.

The trade school is a very practical sort of institution that teaches the student everything there is to be known about one particular line of work. Here he may take up automobile mechanics, blacksmithing, bricklaying and plastering, cabinet-making, carpentry, machine work, painting, printing, steam fitting and plumbing, tailoring, wheelwrighting and blacksmithing combined, as well as short courses in blacksmithing, house painting and shoe repairing. In the business school there is a course of four years of secondary grade and then an advanced course of two years.

In the home-economics school there is a course of two years based on four years of secondary school work. This is especially to train teachers of home economics, home demonstration agents and industrial supervising teachers.

The academy offers a secondary course of four years to prepare students for the normal school, the agricultural school, and the home-economics school. Then there is a school maintained for the colored children of that section of the country, where the teachers about to graduate from Hampton receive practical training in their work.



Naturally, agriculture plays a large part in the work of Hampton Institute. One must remember that out of the 10,000,000 or 11,000,000 persons of the Negro race in the United States a large proportion have always been most familiar with farming. There are many openings in the South for bright young county agents of the colored race to work among their own people. Thousands of farms have been permitted to exist in a run-down condition because, for the most part, no one showed the people how to do differently. That fact is at the basis of Hampton's work with live stock. It has made quite a specialty of the most popular breeds of hogs and has sold them out to both white and colored farmers, for whom it would be almost a financial impossibility to buy from established breeders at regular pure-bred prices. The same thing applies to poultry raising. Hampton will supply a poor farmer with some bird from strains, noted for their egg-laying, at virtually the same price that common birds would bring. The Shellbanks farm has proved the salvation of hundreds of students who would not otherwise have been able to obtain an education. It takes up nearly every branch of farming. The students receive practical experience in farming to balance up their work in the classroom. Extension work also is carried on in Virginia and the neighboring states, looking toward the betterment of agricultural conditions.

When Hampton has erected buildings, the students have usually helped build them. In building Clarke Hall, the Y. M. C. A. building, student bricklayers set all the stone and laid all the brick. This building, which would grace any small city, stands as a demonstration of the practical training of Hampton. Hampton Institute no longer has to rely on small inadequate buildings. The Ogden Auditorium was erected at a cost of $200,000. James Hall is a modern fireproof dormitory accommodating 175 boys and representing an investment of $100,000. There is a magnificent memorial church. In the case of many of the earlier buildings the bricks were actually made on the ground from clay dug on the campus. There are today a dozen buildings that would grace any university, with scores of others of smaller size and less importance. Hampton is a great institution and it does not forget the moral equation. Professor H. B. Turner, of the school, told me the story of a colored boy, who walked nearly all the way from Florida to Virginia to enter Hampton Institute. He declared that his great ambition in life was to be a prize fighter. Nothing particular was said to dissuade him from this ambition, but it was not long before he announced that he thought he could do the world more good by becoming an agriculturist than by being a prize fighter. No one will ever forget the evening he gave his commencement oration as valedictorian of his class, taking for his subject, "A Changed Ideal." And no poor boy from the country ever had a more distinguished audience, for on the platform that evening were seated both former President Taft and Andrew Carnegie.

"Those of us who have any responsibility of leadership whatever must make sure that we keep a broad outlook," said Dr. Gregg, the principal of Hampton. "We must make sure that we overestimate neither the intellectual nor the practical side of school training; that we do all in our power to develop the creative personality of the individual without losing sight of his social adjustment to surroundings; that we make all the education which we impart or help to impart truly, 'education for life.'

"Only thus can our colored schools fulfill their duty to the Negro race, to the South, to the nation, and to the Kingdom of God."

It was noon when the writer left Hampton. The chimes in the great tower of the memorial church had just rung out, "Praise God from Whom All Blessings Flow," as they have done each noon and evening for many years. Across the parade ground came the tramp of feet, the regiment of Hampton men in review, a new race of Booker Washingtons and Robert Motons in the making. The writer recalled that these were only a part. Ten thousand other sons and daughters of Hampton were proclaiming a gospel of usefulness in their own communities.

Right—Clarke Hall, the Hampton Institute Y. M. C. A. building, is a $30,000 two-story brick structure that was built by Hampton students. Oval—Hampton Institute students receive practical experience with agriculture. Every student in the school is paid for the work he does.

Students at Hampton Institute receive practical instruction in almost any trade they elect to follow. Here a group is at work on a building.

How a City Was Put on a Business Basis

Concluded from page 11

to begin a survey of this hydro-electric power project; the city filed on power sites in the Silver Creek territory, and men are now in the field making the preliminary surveys.

Funds also were found from the 1921 income to bring the filtration plant of the city water supply up-to-date, and the virtual rebuilding of this plant is now practically completed. On this, also, considerable money was saved to the city through a check established on the work by Bottorff, who supervised all expenditures and purchases, checked work on all contracts, and established an ironclad rule that every penny put into the work had to be approved by him as city controller. The story of the losses and waste in this one comparatively small part of the city's work alone would fill a good-sized book.

In the spare time they had from their various jobs, Seavey, with the aid of Bottorff, undertook to collect a number of claims owing to the city for years, which previous administrations, for various reasons, some of them political, had failed to collect; many of them on which no attempt at collection had been made. Since 1913, the California State Reclamation Board, and the Federal Government, had owed the city of Sacramento $200,000 for construction of the Bryte by-pass, which was paid for by the city. Bottorff collected the state's share of this debt, and the Federal money is to be paid early in 1922. Sprinkling cases against the street car companies, which had been hanging fire for years, were settled.

The next step was a survey of all cities in California to determine whether the revenues of Sacramento were proportionately what they should be. This work was undertaken and carried through by Controller Bottorff and his staff. Comparison of the charges in each class of business in every city in the state was made. This was a huge task, which required considerable time, but it was completed in the first three months of the city manager operation of Sacramento. As a result it was determined that a comprehensive ordinance regulating businesses, and prescribing adequate license taxes on these businesses, must be drawn. This business tax ordinance was put into effect October 1, 1921, and is bringing from $50,000 to $70,000 annually into the city coffers.

In connection with this, activities along inspection lines were increased, and, because this business tax revenue provides funds for such inspection service, the individual business no longer will be operated in Sacramento at the expense of the public in general. Incidentally, fortune-tellers, hypnotists, mesmerists and other similar performers were put out of business by this ordinance. Law enforcement has been increased.

All departments collecting revenues have been put on a self-supporting basis by the passage of ordinances slightly increasing permit fees. Municipal garbage collection was brought about, and put into effect October 1, with every prospect that it will become self-supporting. The city also took over the contracts of a company for the collection of waste paper and is now collecting and selling to the mills an average of six tons of paper a day, which returns a profit to the city above the cost of collection. A new survey in the assessment department is being carried on, to make a further reduction in assessments, one reduction of 15 per cent having been made since July 1, 1921. This will be completed early this year. Accounts of the city have been placed on the accrued basis, and, though the new form of government had to complete the last half of 1921 on only 40 per cent of the annual revenues, it closed the half-year with a small surplus. A survey of the condition of the city's streets also was made during the last half of 1921, and a city-wide system of simultaneous repair work was begun, the idea being to permit no street to deteriorate at all from the condition in which it is received from the contractors. Despite the reduction in forces, the city engineering department has found abundant time—through greater efficiency—to carry on this work.

BRIEFLY TOLD

Silver dollars at the rate of 200,000 a day are being coined at the United States mint at San Francisco.

Huskies, the half-wolf, half-dog animals used as sled dogs in the Far North, are now selling at $100 each and up, in Northern Canada, and first-class animals are hard to get at any price. Good breeding stock is at a premium and a single one costs several hundred dollars, or as much as a good horse in the States.

A nine-passenger airplane is to be used by Captain Roald Amundsen, discoverer of the South Pole, in his attempt to drift past the North Pole with the Arctic ice pack. The plane will be used in scientific expeditions, while on the trip.

Girls in the Fargo, North Dakota, high school have been instructed to wear graduation dresses at least four inches below the knee this year.

Anthrax germs in wool, still in bales, can be killed by an electric ray which produces a wave capable of destroying tetanus germs in 60 seconds, cholera germs in 15 seconds and bacillus coli instantaneously.

Defective sight among 100,000 persons in the United States could have been prevented in half the cases, according to the field secretary of the National Committee for Prevention of Blindness.

Lloyd George warned against excessive ambition when he said, "the mountain of fame has great responsibility, the higher you climb, the colder and lonelier it becomes; you are exposed to every attack of the elements, also it is necessary to deny yourself the comforts of peaceful home life."

New nitrate beds, 11 feet below the surface and containing 20 to 40 per cent of nitrate, have been discovered in Chile. The deposit covers a district of 2,000 square kilometers.

Street cars in Paris may be eliminated because they cause traffic jams. Committees are considering the financial problem involved in supplanting the trolley cars with motor buses.

A company has been incorporated to provide rigid airship service within America and later to link America with the rest of the world by aerial routes. The first dirigibles will be built in Germany. It is expected that service between New York and Chicago will be established before the end of 1923 with two ships, each designed to carry 100 passengers and 30 tons of express and mail matter. Helium gas and a substitute for gasoline will be used.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

Special prizes are to be offered at the International Livestock Exposition for the champion girls canning club team in the United States. Contests will be held at Springfield, Massachusetts; Sioux City, Iowa; Atlanta, Georgia; Portland, Oregon, and Pueblo, Colorado.

Austria's drink bill for 1921 amounted to about $6,220,000,000, according to an official statement issued recently. This is equal to the total currency circulation and is three times the national coal bill.

It costs $16,000,000 a year to clean the streets of New York City.

Extracting gold from the air is being attempted by the government at the New York assay office. Tests are being carried on by which the smoke, air and dust, which escape from the molten gold and carry away minute particles of the metal, can be refined so that none of the gold is lost.

Camille Saint Saens willed all his music and manuscripts to the library of the Conservatory of Paris. To the Louvre, he left a bust by Paul Dubois, which was the sensation of the 1901 salon, and a portrait by Benjamin Constant.

Of the native-born Americans 22 per cent do not reside in their native states.

To obtain uniformity in time with Belgium and France, "Summer time" in Great Britain began March 26 and will end October 8, according to an order issued recently.

Because of the scarcity of hickory, golf clubs are now being made of tampinis, a species of tree growing in the Malay states. The supply is practically unlimited and if tests prove it to be satisfactory, the wood will supplant entirely the hickory clubs in the British Isles.

London has a dog ambulance. A motorcycle with a sidecar is padded with straw and blankets, in which the animal is placed. The ambulance is ready at all times of day or night and may be called by telephone. A veterinary accompanies the ambulance. If the case is hopeless, he kills the dog. If the case is curable, the dog is rushed to the operating table of the hospital.

There are now more than 700,000 radio receiving outfits in the United States. Nine months ago there were fewer than 50,000.

The ossiphone, the invention of an Englishman, is an instrument by means of which deaf persons, whose nerves of hearing are unimpaired, may hear through the medium of the bony structure. The ossiphone is not effectual in all cases but in certain instances it is efficient where other apparatus is useless.

The magnitude of the insurance business in the United States is almost beyond comprehension. An authority says there are 2,368 companies including mutual associations, and 583 fraternals doing business of which there are 823 life, 1,481 fire, 338 casualty, and more than 1,700 county farm fire organizations. Altogether there are more than 6,000 different organizations furnishing insurance. Licensed agents make an army of 604,591 individuals, not including solicitors of large agencies who are not listed.

A new machine digs a ditch 12 feet wide on top and seven feet deep, while crawling steadily ahead like a prehistoric monster. A revolving wheel scoops out the earth and a conveyor belt carries it 20 feet to the side to deposit. With a crew of five men the machine can drive a ditch ahead a quarter of a mile each working day.

A new leather grease, cheaper than animal fats, is made from mineral oils.

Canada has settled 27,000 Canadian ex-soldiers on farm land and has lent $85,000,000 to these men. The full purchase price of the land and up to $3,000 for buildings, equipment and stock has been advanced to each. Only seven per cent of the men thus aided have abandoned their property and last year's crops from soldier lands were valued at $15,000,000.

Automobile-making ranks first among the industries of Italy.

The largest sailing ship afloat is under the French flag, commanded by a Breton captain. The liner, *La France*, is a steel boat 418 feet long, and 5,633 tons burden. It is a five-master, hoists 30 sails, carries a crew of 54 and its best fair weather run is 322 knots.

U. S.—Biggest Interest Payer in the World

Rate of Interest Payment Equal to Daily Cost of War at Its Highest Point

By TOLBERT R. INGRAM

INTEREST—premium paid for the use of money—is a word with which every American schoolboy is familiar. But the history and romance, the trials and tribulations, and the joys and sorrows wrapped up within its meaning are less generally known.

Interest results from the borrowing or lending of money upon pledges for profit. Money placed out on interest knows no eight-hour law, holidays or summer vacations. Interest may become a willing slave or an onerous task master. It plays with fate and holds the destinies of industries and governments within its grasp.

Money was used at one time in the world's history solely as a medium for facilitating the exchange of commodities. When the charging of a premium for its use was inaugurated, its character began to change until it in turn became a commodity and now it is quoted on the financial pages of the newspapers alongside the market on eggs and butter. When men are badly in need of it they will pay a larger premium for its use or when there is plenty of it available, the premium becomes smaller and, like other commodities, its price becomes governed by the law of supply and demand.

The borrowing and lending of money for profit was at one time in the world's history looked upon as a rather degrading custom and as far as the needs of the poor were concerned, was forbidden. The laws of Moses did not contemplate any raising of loans for the purpose of obtaining capital. Such persons as bankers and sureties, in the commercial sense, were unknown to the earlier ages of the Hebrew commonwealth. The law strictly forbade any interest to be taken on a loan to a poor person. Not only was no usury on any pretense to be exacted, but relief for the poor by way of loans was enjoined and excuses for evading this duty were forbidden.

The feeling of antipathy toward the practice of usury and also of suretyship began to give way, however, as commerce increased. Expeditions to the Orient and to Africa required large cash outlays. The owner of capital began to take pledges for his money and charge interest—leaving the risks and the profits to the other party to the agreements.

There Is No Armistice in This War

PUTTING money to work for the stipulated price proved profitable and the business has grown by leaps and bounds. The discovery of America opened a great field. Here was a virgin country rich in natural resources awaiting development. Railroads, highways, mills and factories, mines, smelters and kindred enterprises all awaited the coming of capital and capital found it a profitable field at high interest rates. The result is the wonderful expansion of industry and commerce in America during the past few centuries, *along with which came the greatest interest-paying nation on earth.*

It would be interesting to know just how much it costs the American people to pay the premiums on the money they borrow. We know the totals are enormous. There is no doubt but that the interest payments at least equal $1,000,000 an hour for every hour in the day and every day in the year but how much above that amount is merely a surmise. When the war was costing the United States $24,000,000 a day, the people accepted it as a matter of course and bought Liberty bonds in amounts up in the billions. The money was used to end the war. The people could see armistice day in the near future, when the conflict would terminate and the expenditures decrease. But the payment of interest goes on and on *at a rate equal to the cost of the war* at its most expensive period. And with interest there is no armistice day in sight.

We have become so accustomed to receiving or paying interest that we cannot realize the growth of the practice. It is like the child who grows from day to day under the eyes of his parents until in the course of time he becomes taller and larger than his daddy before they realize he is no longer their baby boy.

The United States Government, probably *the largest single borrower of money in America,* makes the largest interest payments for the use of this money. At the end of 1921 the public debt of the government was $23,438,984,351. It costs Uncle Sam a tidy sum of money to pay the premium for the use of this money. For the fiscal year of 1921 the amount actually paid out in interest on the public debt was $999,144,731.35 and General Dawes, budget director, estimates that it will take at least $975,000,000 in 1922 and a similar amount in 1923.

The war made us so familiar with large figures that it is difficult to realize what $999,144,731.35 means. There are 525,600 minutes in a year. If the government paid out $1,900 every minute in each hour, 24 hours a day, every day in the year, it would be within a million dollars of having accomplished the payment of its interest when the last minute of the year expired.

Another way to visualize the amount is to recall that the largest private loan ever floated in the United States was the Anglo-French loan in 1915 for $500,000,000, or just about half the amount this government paid out in interest charges last year.

There is another class of loans which call for interest payments just about double the amount paid out by the government. These are the loans and discounts of the banks of the country. A composite statement of the national, state and private banks and trust companies of the United States, comprising 30,100 institutions, as of June, 1920, shows total loans and discounts of $31,256,147,000. These are the loans made by the banks to their customers and are mostly secured by real estate and farm mortgages, or collateral of one kind or another. Estimating the average interest rate at six per cent, it means that the people of the country must go up to the bank counters and pay $1,875,368,820 a year for the privilege of using the money which the depositors have left with the banks.

These two items are only a small part of the enormous sums passed from hand to hand each year as premium on borrowed money.

Two hundred and twenty-seven cities of 30,000 or more population had a funded indebtedness at the end of 1919 of $3,455,580,993 and the interest on this money paid by these cities in 1919 was $156,630,209. Inasmuch as most of the towns of the country under 30,000 population have funded debts, the amount mentioned above would be greatly increased if this information was available. How far short the figures are from the real totals may be surmised when Dr. Edwin R. A. Seligman, professor of political economy of Columbia University, estimates the amount of tax-exempt securities outstanding in this country at $30,000,000,000. Of this amount, he says $10,000,000,000 is composed of municipal, county, state and school bonds and notes. They are exempt from taxes, but they give no exemption of interest.

The funded debt of the 48 states of the Union at the end of 1919 was $625,098,881 and the interest paid during that year for the use of this money was $24,079,806. The funded debt of the counties within these states at the end of 1919 was $332,236,161 and the interest payments during the year amounted to $17,417,593.

The railroads of the country are borrowers of vast sums of money. The funded debt of the Class A railroads, those with a gross income of $1,000,000 a year, or more, was $10,015,273,670 on December 31, 1920. Estimating the average rate of interest at four and one-half per cent, these loans call for annual interest payments aggregating $450,687,315. The Class B railroads will add approximately $1,800,000,000 in funded debt and $81,000,000 a year in interest charges.

The Federal Land bank had $434,534,775 in bonds outstanding on December 31, 1921, which call for the payment of around $19,554,064 in interest each year.

A total of 6,542 companies operating central electric light and power stations in the United States had a funded indebtedness on December 31, 1917, of $1,297,319,859 and the interest payments for that year amounted to $58,379,393.

One thousand three hundred and seven electric railways on the same date had funded debts amounting to $3,050,179,272 which call for annual interest payments aggregating $126,654,327.

Two thousand and two hundred telephone systems had funded debts of $503,558,971 on December 31, 1917, on which the annual interest amounts to $26,868,861.

The census bureau places the farm mortgage debt of the country in 1920 at $4,012,711,213 and the average interest rate at 6.1 per cent which means that the farmers have to pay $244,775,383 in interest on their indebtedness each year.

Interest earned in 1920 by 62 life insurance companies amounted to $307,954,928. This indicates the face value of the loans to be around $6,159,098,560.

Interest earned by 218 fire insurance companies the same year was $59,069,470.

The figures already given show that the people and corporations of this country are in debt for borrowed money to a minimum amount of $87,562,133,106 and that they are paying for the use of this money approximately $4,447,584,930 a year. In order to appreciate the size of this amount of money let us point out that it would take 77 per cent of all the gold and silver coins, Federal reserve and national bank notes, treasury notes and moneys of all kinds and descriptions in circulation in the United States on June 30, 1921, to pay the interest on the debts enumerated for only one year.

$38,880,000 a Day Post-war Interest

IF THE total annual interest requirements were known it would be found that there is not enough money in circulation in this country to pay the interest on our debts for a single year.

But the totals given above reveal only in part the annual interest requirements of the country. The manufacturing industry, the gas and waterworks utility companies, buyers of city homes on contracts, the towns of less than 30,000 population, individual borrowers from individuals, investments of benevolent and fraternal organizations and numerous other classes of borrowers and lenders are not included. For example, the census credits the country with 289,768 manufacturers in 1919 with a capital of $44,678,911,000 but no estimate is made of the amount of this capital which is borrowed money.

If we step outside the realm of the United States for a moment and consider the world situation, the figures for this country will assume an unimportant aspect in comparison. The post-war debts of the nations of the earth are placed at $354,181,523,786. At an average interest rate of four per cent, these debts call for annual payments of $14,167,260,948 in premiums on the borrowed money or $38,880,000 a day. They are not all, however, being paid for the reason that some of these nations are financially unable to meet the obligation.

The figures above given have applied only to the annual interest payments. These do not convey any indication of *the ultimate cost of these loans.* Some of the railroad companies, for instance, have bond issues outstanding representing money they have borrowed which do not mature until one hundred years after they were issued.

One railroad borrowed $211,582,500 on long-time bonds for which it agrees to pay four per cent annually. The interest at maturity for these loans will aggregate $817,525,000, or almost $400 for every $100 borrowed on top of which the company must pay back the principal.

This is not an isolated case for a compilation of 12 leading railroads show they *borrowed $1,636,101,130* with no sinking fund or callable features *for which they agree to pay $5,949,245,017 in interest in addition to repaying the principal.*

It is a saying in some quarters that railroad bonds are never paid at maturity but are refunded with a new issue of bonds. Under this method interest is still being paid on money borrowed when our fathers were young men and which will not mature until our children are old men. It is almost certain in some instances, if not many, that the rails, ties and equipment which were purchased with this borrowed money will have been entirely worn out and replaced two and three times and not so much as an original spike left when the debt is paid.

The statistics all show that the borrowing and lending of money is steadily increasing. New capital issues, consisting of bonds, notes and stock, amounted to $2,634,869,000 in 1921. The total for the past 10 years amounted to $20,590,020,000 exclusive of war and government loans. The need for additional borrowed capital was indicated at a hearing of the Committee on Ways and Means of the House of Representatives at Washington on January 16, 1922, when Philip H. Gadsden, chairman of the joint tax committee of several public utility associations, estimated the annual needs of the public utilities at $750,000,000, the telephone and telegraph companies at $100,000,000 and the steam railroads at $1,000,000,000, or a total of $1,850,000,000 of new capital per year. This is exclusive of $6,000,000,000 which railroads, according to their officials, need at once for rehabilitation and also of the needs of manufacturers, mercantile industry and municipalities. The growth of debts is emphasized by census statistics which show that interest payments of 146 cities increased 182.7 per cent between 1903 and 1919.

A New World Condition—Can It Be Met?

AN INTEREST charge is a fixed charge and its lack of flexibility makes it impossible to adjust it to constantly changing business conditions. A corporation may be earning several times its interest charges when a new bond issue is floated only to find that during a business depression the non-flexible charge becomes a burden which it cannot sustain and bankruptcy is the result.

The question as to where the custom will lead us if it is not stopped, or at least, abridged, may be considered as a serious one. The annual interest charges are steadily increasing and there is nothing to indicate that any change may be expected in the near future. In fact, the demand for loans at this time probably is greater than at any time in the past. This steady increase carried over a considerable period of years can only lead to increased cost of living, greater efforts to meet the greater expense and a division of the people into two classes—those who pay the interest and those who clip the interest coupons. We may well consider whether the growth of the custom will not in time compel us to face the question of whether civilization can endure the strain.

This brings up the question whether men in previous ages foresaw and forestalled conditions similar to those in which we find ourselves. The ancient Hebrew commonwealth effectually met this condition every seven years for individuals, and every 50 years for large groups.

Each seven years the Hebrew commonwealth had a Year of Release in which all money debts were forgiven or outlawed. Every fifty years came the Year of Jubilee when lands lost through taxes or trade were returned to the family of the original owner. The Year of Jubilee restored equality to the people and prevented one entire class from becoming the slaves of another class. The whole national slate was cleaned, and a new start was insured to everyone. They considered forgiveness better than revolution. Many people are today becoming enslaved from debt and if the custom continues to grow we are certain to have two classes—the debt-paying slave and his master, the debt collector.

The heads of the European governments seem to be scenting something of the nature of a Year of Jubilee even though they have not yet struck the trail which leads to the quarry . . . .

Picture the country awakening on the morning of the beginning of the Year of Jubilee. Within the year all people must pay their debts and if they are unable to do so, their debts will be forgiven. All outstanding accounts will be balanced. The nation goes upon a cash basis. Men will possess the money that is owing them. The slate will be cleaned. Ample capital through the recovery of principal will be available for the country's needs and a new era of development will be ushered in. Investments can be made with greater safety because there will be no prior debts to endanger the security. The saving in interest charges will be simply enormous and failures will decrease in proportion. Men formerly burdened with debt almost to the point of slavery will lift up their heads and look the world in the face. We will have applied the brakes to a custom which is threatening the foundations of civilization. No man will be deprived of his true wealth but only the usury which he has been receiving for allowing the other man to employ that wealth in behalf of his fellow man.

Woman Physician as Mayor Is Curing City

Her Honor, of Fairport, Ohio, Wins Fame Battling Lawlessness

MAYOR KAUKONEN CONDUCTS LIQUOR RAID

WHEN arrogant lawlessness is in the saddle, and the law-abiding citizen keeps out of sight, it is time for the exercise of a strong hand in government.

So thought the electorate of Fairport, Ohio, last autumn. Whereupon the men and women went to the polls and selected as mayor, Dr. Amy A. Kaukonen, a slight, comely girl of 22 years.

Her election was a mandate for strong-arm suppression of the unrestrained violation of the prohibition laws.

Fairport is a picturesque lake port, 30 miles east of Cleveland. It has only 9,000 inhabitants but, prior to last November, it had won a place in the front rank of the municipalities in which open violation of the law is viewed with approval. In the Pullman smoker and the club car, Fairport's name had prominent place in the conversations devoted to the location of the lawless haunts from coast to coast.

In Fairport itself, there was a sort of blatant pride in the openness of the law violation. Citizens bragged of the success of their stills, and their recipes for brewing beer. An undertaker, grimly humorous over a dual occupation of bootlegging and burying, fitted out one of his caskets with a spigot and held a long, gleeful and profitable wake over the demise of John Barleycorn.

A long debauch disgusts even those who participate in it.

And when Fairport awoke one morning to learn that one of its police officers, crazed by drugged moonshine whisky, had run amuck in a bootleggers' resort, and shot to death another policeman, the little city decided it was time to put on the brakes.

Fairport cannot yet understand just by what trick of fate it happened to choose a 22-year-old girl for its mayor. A girl mayor is a novelty any place. But a girl mayor who has never been a suffragist, never taken part in politics, never made a single street corner speech, but has played the piano, romped with her Airedale, "Pat," shopped for intensely feminine clothes, worn her blond hair in the latest coiffure, sung in the choir on Sundays and danced during the week, is a novelty of the most extreme degree.

Dr. Kaukonen was born in Elyria, Ohio. During her school days she was considered an unusually talented pupil. At Conneaut, she won the high school scholarship which enabled her to enter the Woman's Medical College in Philadelphia, where she again led her class, graduating as the institution's youngest pupil.

About a year ago she hung out her shingle as a physician in Fairport, specializing in children's diseases.

As a physician she naturally came frequently in contact with the effects of the traffic in poisonous alcohol. But she took no part in the political consideration of the subject and it was an unmitigated surprise to her when a committee called on her and asked her to run for mayor on a reform ticket. She laughed at the request and would not accept the proffered nomination despite the seriousness of their insistence. They would take no refusal and left only when she promised to think it over.

Then Dr. Kaukonen says she promptly put the matter out of her mind.

Dr. Kaukonen was called professionally when the bootlegging tragedy which resulted in a police officer's death occurred. This event determined her entrance into the campaign for mayor.

The campaign was a warm one. But the citizens, even the most confirmed liquor addicts, were aroused to the danger of the continued supremacy of bootleggism. Dr. Kaukonen had announced her intention relentlessly to fight the prohibition violators. Women took the lead in her campaign, but men joined them in the fight, and husbands and wives went to the polls together on election morning and Dr. Kaukonen received the largest majority ever given a Fairport mayorality candidate.

Dr. Kaukonen's induction into office was characterized by a new funeral at the bootlegger undertaker's place. This time it was a watery one. The new mayor solemnly marched six of the town's huskiest officers to the undertaker's establishment, seized the basket-saloon, hoisted it on a truck, and, with the town band playing the "Prohibition Blues," marched down the main thoroughfare and dumped the liquor into Lake Erie.

There was something spectacular about this first raid by the new mayor, and there has been something spectacular about subsequent ones which she has led in person. Spectacular raids always draw the criticism of those persons who insist that government must be ultra-dignified. Regardless of the justice of this criticism it must be admitted by the critics themselves that the new mayor's tactics have carried out the town's desires.

Gambling and bootlegging have been made hazards instead of recognized vocations. Mayor Kaukonen's raids, whether they have utterly eliminated liquor, have made it a subject to be discussed in whispers rather than in loud tones.

The new mayor's law-enforcement program has met the usual obstacles, legal and human. She has been forced to call to her assistance the state prohibition authorities and to arm them with technically correct search warrants. But the clean-up program has gone forward steadily. Dr. Kaukonen has planned and directed each raid. The battle for law observance has been characterized by sensational incidents. At one place as the raiding party was entering a shot was heard; a man dashed out; Mayor Kaukonen braced herself and captured him. One woman attempted to destroy the evidence of her husband's business by pouring raisin whisky into the sink. Dr. Kaukonen quickly seized a piece of bread from a table near by, stopped the drain with it, and enabled the officers to obtain enough of the liquor for analysis.

Federal prohibition officers and law enforcement league officials somehow got the idea that the Kaukonen administration would need instruction in how to enforce the law. So representatives went to Fairport to instruct. When they got there, she took personal charge and gave her instructors a valuable education in the course of a raid that included 11 speak-easies. The biggest raid of her campaign took place about a month after she took office, 10 stills, 1,000 gallons of mash and 25 barrels of whisky being seized.

Although Dr. Kaukonen conducts her crusades earnestly, she entertains no illusions of the immediate destruction of the liquor traffic.

"Do you believe bootlegging will be completely wiped out?" someone asked her.

"Bootlegging," she replied, "is a long and lingering disease. When you think it is done for, it is the most dangerous. Many men who appear to be the most ardent prohibitionists are the most ardent seekers for cases of whisky.

"As a matter of fact, the bootleggers do more than the enforcement officers to make prohibition prohibitive. They make drinking a hazardous avocation with poisonous drinks. The drinking public has little faith any longer in the truthfulness of labels. There are a few drinking men who will risk anything for the 'kick' but most men nowadays are wary of drinks they are not able to identify definitely."

It has been in connection with her war on prohibition violators that Dr. Kaukonen has been most active as chief executive. But her own attractive personality, her youth, and the novelty of her incumbency of the mayorality office all combine in the arousing of the intense interest that has been taken in her.

11 HOUSES SEARCHED; ARREST 3

Woman Official Had Worked Many Weeks For Evidence, State Agents Aid.

Three arrests and a quantity of confiscated intoxicating liquors were the result of a raid on eleven Fairport homes staged Tuesday, at noon by Fairport officials and state prohibition authorities from Cleveland under the leadership of Mayor Amy Kaukonen. The men arrested in the raids were Harry Kugan, Alex Kuhosko and [illegible] Kobach.

[illegible] home three 5-gallon kegs of [illegible] one ten-gallon jug of [illegible]

Her Honor, the Mayor of Fairport, Ohio.

After a successful raid by Fairport's fair mayor.

The New Federal Judgeship

THE evil of the omnibus legislative act has assailed the American judiciary, after that branch of the government had enjoyed 120 years of freedom from the pork-barrel and pie measures with which Congressmen have been inclined to please their constituents.

By a vote of 44 to 21 the Senate passed the amended House bill providing for the creation of 22 additional Federal judgeships. The majority coincided with the number of Senators whose states were given additional courts. Unprecedented log-rolling accompanied the passage of the measure. An amendment giving a judgeship to New Mexico was first defeated, then passed. The two Senators from New Mexico voted for the final passage.

Party lines were broken in the vote but patronage lines remained solid.

Bills creating single judgeships to accord with the pressure of work had been passed the Senate on several occasions during the last few years, and allowed to die in the House of Representatives. The House this year collated these bills, added a few more courts for good measure, and sent the omnibus bill to the Senate approved. The Upper House with a few additions accepted the bill.

During the closing hours of John Adams' Administration, the President was busy signing commissions for judgeships, created in just the same carry-all legislative way that the new ones were authorized. Such was the public indignation over the proceeding, then, that the first Congress under Jefferson declined to appropriate salaries for the new courts, and the judgeships perished.

Rivers and harbors bills and private pension bills were for years the chief reliance of Congressmen eager to sugar their constituents with "pap." It is unfortunate that the lull in such appropriations should be broken by the wholesale manufacture of judgeships.

Keep It American

SERIOUS fear is expressed among the lyceum and chautauqua workers over the danger of an invasion of their province by a host of actors driven from the stage by the effects of financial depression upon the theater business. New York theatrical agencies advertised during the winter months for hundreds of actors for chautauqua work.

The chautauqua in the summer and the lyceums in winter have occupied important places in American intellectual development. The lyceums grew up in the middle portion of the last century, when the opportunities for educational treats were rare, and through them were afforded the rare glimpses which a great portion of the public obtained of famous national figures. In a great measure the influence of the institution has waned because of the vast quantities of entertainment which are produced for the benefit of the pleasure-seekers of the larger cities. But in the smaller cities the chautauqua and the lyceum are still factors, and despite the growing tendencies toward professionalism, they are elevating ones.

Lecturers with real information to impart, concert companies, Shakespearean players, magicians of the higher class, and others whose entertainment has been instructive, have been billed on these circuits.

Now comes the threat of invasion of a horde of mediocre actors, of the class which has robbed the American stage of its high rank. These new elements are well equipped in technique for their assault on the platform. They know the value of entrances, they understand lighting effects, and they can pose to best advantage. The average lecturer is amateurish. He stumbles on and off. He drinks from the water pitcher at the wrong time. Frequently his ability, through stage presence, to attract close attention is no greater than that of the flapping tent, the bare lecture room wall, or the crying baby on the front seat.

The lyceum bureau and chautauqua folk have had to rely on the sheer value of what they said or did. The invaders hope to displace them through the smoothness of their surface methods.

It is an important duty that devolves on the persons in each town who select the lyceum and chautauqua courses to be arranged. They must scan with increasing care the list of numbers offered to make sure that the course they select is not dis-Americanized.

The Degree Mill

THE American University Union in London wants Congress to do something to prevent ambitious English men and women from being mulcted by the get-learning-quick colleges and universities in the United States.

The following is typical of advertisements which are being inserted in religious and secular press in the British Isles:

> "Degrees and how to obtain them: B. D., D. D.; of Oxford, Cambridge and also American colleges; thorough preparation."

Interested parties replying to the advertisements were supplied with the information that Oxford and Cambridge degrees required at least four years' residence, while some of the nicest degrees in the world could be obtained by remitting $25 in American money, to the college advertising.

Whereupon there has been an alarming increase in American learning, documentarily proved. Not only has the degree mill operated in five different American institutions of learning been turning out the stereotyped degrees, but a few new ones have been invented to suit the tastes of the particular applicants. One, D. Ph., intended to represent Doctor of Psychology, has been especially pleasing to such persons as were willing to be mistaken for Ph. D's.

The American University Union believes that Congress should protect the gullible buyers of degrees in England. There is something to be said for that contention, but protection begins at home. How about a little protection for those rich unfortunates who have spent huge sums in England for impressive coats of arms or blue-blooded lineage! The English buyers of American degrees have doubtless had $25 worth of blissful preening, while it would have to be a remarkable pedigree which would maintain eminence for even a few generations.

Needs Explanation

OFFICIAL reports of production and consumption of petroleum indicate an excess of production that is startlingly consistent, and in the face of which the continued high price of petroleum products seems in need of a candid, truthful explanation.

Practically quoting the report, an analysis of complete official statistics for January, 1922, shows there was an excess of domestic production and imports over consumption, including exports, amounting to *21,285,343 barrels,* or at the rate of more than 250,000,000 barrels annually. *In January, 1921, the excess was 7,812,405 barrels, and in December of 14,087,539 barrels.*

Oil is a natural resource and its products enter into the economic life of every man, woman and child. Its delivery for use, in any of its forms, at the lowest possible price is a duty devolving upon all engaged in the industry. Its conservation is also a duty owed by this generation to those that follow. Yet the industry is practically a monopoly, and appearances indicate undue profits somewhere.

To fill out the column in which this information was found in a leading oil journal is a significant one-line paragraph:

"Oppose indiscriminate price cutting."

The Public Should Be Told

TO THOSE who wonder why it is the public never has been informed of the amount paid mine owners and charged to production cost, it may be of interest to know that an injunction, granted two years ago by the Supreme Court of the District of Columbia, at the instance of the Maynard Coal Company, restrains the Federal Trade Commission from making an investigation that would be a disclosure on that point. Why the decision has not been reviewed is not announced. It is possible that the operators, who are now generally blamed for the trouble, will tire of being the "goat" and divulge the real profiteers—the mine owners—who neither make, mine nor market coal, yet absorb the greater part of the profit of all three operations.

Buying Loyalty?

WITH the blare of trumpets, announcement is made in New York City of a convert from the ranks of anarchy to the cause of organized government in the person of Dr. Max Cohen, formerly secretary of the Left Wing of the Communist party.

In 1919, Dr. Cohen, known as the "master anarchist," was indicted under the New York state laws for criminal anarchy. Jointly charged with him were: James Larkin, Irish agitator; I. E. Ferguson, a Chicago attorney; Charles E. Ruthenberg and Benjamin Gitlow, former Socialist assemblyman.

Larkin, Ferguson, Ruthenberg and Gitlow faced the music, were tried and sentenced to prison for from 5 to 10 years. Dr. Cohen, the dominating figure of the group, deserted his comrades and fled. For three years he was a fugitive.

Some days ago in company with his lawyer, Samuel Ecker, he walked into the office of the New York district attorney, Joab Banton, and surrendered. He was taken without delay into the court presided over by Justice Isidor Wasservogel and there pleaded guilty to the charge of having advocated principles which had for their aim the overthrow of the government. Then solemnly he renounced his anarchistic beliefs and promised to be a good citizen.

Justice Wasservogel thereupon placed him on probation and suspended sentence for five years.

Organized government receives the lip service loyalty of Dr. Cohen, but we wonder whether the anarchism of Messrs. Larkin, Ferguson, and the others behind the bars of Sing Sing, is not somewhat greater. And we wonder whether Dr. Cohen smiled or laughed when he pledged his allegiance to a democracy which believes in equal rights to all and rests its hope on an unbiased judiciary.

Winston Churchill's Humor

SINCE Nebuchadnezzar went to grass, there probably has not been a better joke in Babylon than the remarks of Winston Churchill, British colonial secretary, regarding the erection of a great democracy in Mesopotamia, traditional site of the Garden of Eden and center of the culture of the great empires of Babylon, Assyria and Persia.

The protests of the long-suffering taxpayers over the expenditure of one hundred and twenty-five million pounds in Mesopotamia had finally merited government answer, and Mr. Churchill attempted to explain in Parliament. The colonial secretary promised that appropriations would be cut next year to eight million pounds through the setting up of the independent Arab kingdom of Irak under Britain's friend, King Feisal. Further economies were to be expected, Mr. Churchill indicated, through the innate profit-making powers of democratic institutions. He went on to explain the advance of democracy. Parliamentary record reports as follows:

> The municipal elections, an essential preliminary to the elections for the national assembly, were nearly concluded, and it was interesting to note that they had resulted in the return of moderate men in sympathy with the policy of His Majesty's Government. (Laughter.) In many cases the Emirs appointed by the British Government were elected. (Renewed laughter.)

Well, What Can You Expect?

GOOD taste would have prevented the chairman of the United States Shipping Board making an announcement publicly that it had been decided to change the name of the liner Leviathan to Warren G. Harding.

There is no objection in general to the naming of government vessels after the presidents. But there is sound specific objection against attempting to perpetuate the names of living statesmen through the operation of agencies which they control. It is true this rule has been violated, but the breaches afford no answer to the reasoning.

President Harding is known to the American people as a modest man. He comes of a stock whose natural impulse is retiring. The desire to be seen of men is undoubtedly as foreign to him as it is foreign to Americans in general. Sycophancy must be repellent to him, and he must recoil from the idea of having a great ship named after him by Shipping Board members who derived jobs and christening powers from him.

There is additional reason why the Leviathan should not be renamed. It was the vessel on which the largest number of American soldiers was carried overseas during the World War. Sentiment, if nothing else, should dictate the retention of that name.

The chairman of the Shipping Board is a Mr. Lasker, an advertising agent.

Mr. Ford's Page

RECENTLY a person was found who thought that "materialism" meant having something to do with materials or matter. This person was fully convinced that "materialism" was to be utterly condemned; all the literature which he read upon the subject had his assent; all the people who joined in condemning "materialism" seemed such nice people. He developed a horror of smokestacks and of factories and business places in general; presently he developed a horror of working people and business people in general. He affected to regard books and pictures and music and soft manners as the real products of life.

It is very likely that many people agree with the cry against "materialism" because they think it is a protest against smoke and grime and the general dustiness of labor. These interfere with their landscape. They think that the protest against "materialism" means that the workaday world will some day be wiped off.

It is time that this impression was being corrected among our young people. If they are being encouraged to believe that by simply twiddling their fingers and indulging in the shop-talk of the library and the studio they are helping to lift the world to a higher plane, someone should step in and correct that state of affairs.

They need to be shown the difference between bondage to materials and the mastery of materials. Matter is at the very foundation of our life here. Everything we can touch or use is at bottom dirt—plain dirt of the earth. White linen is dirt; luscious fruit is dirt; gold is a form of dirt; the canvas that holds the masterpiece is dirt; wood is dirt; the dainty flesh of the babe and the wrinkled body of old age are all creations out of the soil of the earth, and all shall crumble back to dust again.

So there is not the slightest reason for us to be uppish about a substance which is essential to our life on this planet. "Materialism" is an affair of mind, not of matter. The grossest "materialism" has existed side by side with the utmost poverty of materials.

Take the primitive races, for example: how little control they have over matter: a coarse fabric, clay vessel for domestic use, crude military and agricultural weapons—the utmost poverty of materials existing alongside the most sordid "materialism," that is, material-mindedness. The people who think most about the material are the people who have least of it. The solution of the problem of "materialism" is to make the conquest of matter so thorough and its benefits so widespread, that material supply will be as certain as the air or water supply is.

THE so-called "materialism" of the age is caused mostly by a lack of materials, not by a deluge of them. When people are sure of enough of what they need, they cease to think about it; it is the uncertainty that chains their minds to the one point of anxiety. The cure for "materialism" is more materials—enough for everybody and to spare. When matter is the servant there is no danger; and matter becomes master only when we cannot control enough of it to meet our needs. The man who has nothing is more of a "materialist" than the man who has enough; the latter's mind is emancipated by a sufficient supply. Much loose thought upon this question can be checked by plain everyday common sense.

It is not the material that leads to "materialism," so much as it is the need of material.

Life is so organized that when you want to conquer one plane you must do so from the plane above it. That is, you cannot conquer the material plane from that level; you must go up one step into the plane of mind. The conquest is always from above.

Economic questions are never settled on the economic plane; you must go up one step. That explains one cause of the chaos of the world today—men have fallen victims to the false belief that political questions are going to be settled on the political plane, and economic questions on the economic plane. Plain sense would tell us otherwise. Nothing ever happens for the better in politics except when the impulse comes from outside the region of politics. The economists are blind leaders of the blind; they know what is, they do not know what ought to be. They know how the present economic machinery works; they cannot give the drawings for a better machine. The new economic impulse will come from forces outside the narrow circle of professional economics—quite outside of it.

Now, the time in which we live is marked by a mighty mixture of mind and matter, mind acting upon matter for the production of ten thousand material helps to a richer and more satisfactory life. The conquest of matter by mind—in the inventive, mechanical and industrial sense—has been attended, as all conquests are, by a mingling of the victor and the vanquished. If matter has been mixed with mentality, so to speak, so has mentality been touched by matter.

And if this mingling of the two elements continues without the admixture of a third, then it is quite likely that instead of matter remaining the conquest of mind, mind itself may be dragged down to that condition which is properly known as materialism—enslaved by the interest in and the demands of matter.

So, the corrective to be applied is simply to go up a step. Economic and political problems are all one form or another of materialism. To surmount them it is necessary to ascend one step. The next step above is the moral plane. The moral plane has to do with purpose and motive. Economic and political questions are all easily solved here; they are impossible of solution on their own level.

The physician who straightens the limbs of little children is a materialist, a mechanic, but his work is lifted out of sordidness by his purpose and ability to help. When all work in material is done to make the world a better place to live in and to help people live richer lives, all the problems of labor and capital, of the market and the money system, are going to fall into line. There will be more *material* and less *materialism*, because matter will have been fully conquered by something more than mind, which may be right or wrong, by good will which is always right. The only good thing in the world is good will, and where there is a good will there is always a right way.

It is quite easy to see, then, that the way out of "materialism" does not lead away from materials. We are not to drop our tools and quit preparing material and making useful things. We are not to dismantle our forges and put out our fires. We are not to strive to attain a lily-fingered incompetence in the world. No. We are to go forward to the greater conquest of material, so that everything needful shall be so common and so easily secured that there will be no worry whatever about it.

Our problem is a simple one of housekeeping. We have got to arrange the machinery of life so that it shall deliver the goods without breakdown or uncertainty. The people are ready to live an expansive life as soon as we settle the question of how to maintain an even flow of the necessities of life to all men. The first necessity of life is a chance to work: there is always work waiting to be done in the world, but there are not always jobs for the worker. Now, the work which is waiting ought to be constantly flowing in a sufficient number of jobs to take care of everybody. It is not a matter of revolution or sensational politics to do this: it is merely a matter of engineering. The stump-speaker must give place to the engineer. And engineering is never so noble—indeed there is no work superior to it—than when it is applied to constructing a dependable system of life for all people.

That is what real materialism is going to bring us—an emancipation from the evils of "materialism." We shall get so much of the material that it will no longer be the alluring thing it is now; and then we shall go on to other things, secure that the material foundation is laid.

Thomas Nelson Page, Embassador in Literature

Has Done for Virginia What Hamlin Garland Did for the Changing West

By FRED L. HOLMES

WHY is it so many writers and authors have been appointed to foreign diplomatic posts to represent the United States?

Thomas Nelson Page, the famous Virginia author, was back in Washington, D. C., after seven years of service as ambassador to Italy, and I sought him for an answer.

"A list of writers who have been diplomats would be formidable," remarked Mr. Page as he pondered my question. "I have also wondered why it is that writing and diplomacy have been united in the same person. Is it because a writer has to learn diplomacy to deal with publishers, or is it because a diplomat has to have imagination? Both occupations are extremely interesting and both are most honorable, both have some pleasure and many pains."

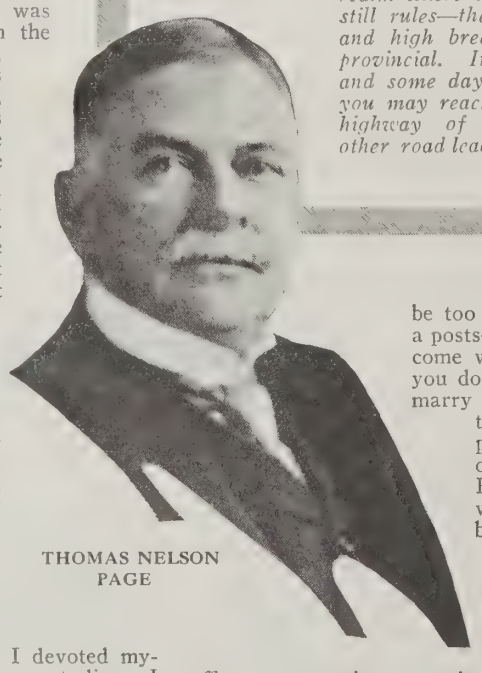
As he talked I made mental note of some of the recent writers who had filled diplomatic posts—Maurice Francis Egan, Henry Clay Ide, Albert Halstead, George Harvey, Walter Hines Page, Paul S. Reinsch, and Brand Whitlock. Afterward I looked into some of the histories and I found that the list might be multiplied. Truly the rôle of diplomat and author had often been played by the same person.

Perhaps it is the courtliness, the genteelness, the affability of many authors that has placed them in these posts as diplomatic representatives. Thomas Nelson Page is such. He is modesty and industry combined and in his books pulses the life of the South—that picturesque, chivalric southern life characteristic of the best homes in Virginia before the days of the Civil War.

One great service has been rendered to the nation through the writings of Thomas Nelson Page. He has tried to make the North and the South comrades in citizenship. Through the pages of fiction he has revealed the South to the North and the North to the South in his effort to promote a real national spirit.

One who reads Virginia history will find that the Page family has been present in the centuries. Beginning with John Page, back in 1625, the name will be found in records of the old assemblies, meetings of the house of Burgesses and as friends of Washington and Jefferson.

Out of the South, from different states, in the last decades have gone two ambassadors to foreign courts with the name of Page. Walter Hines Page, who was born in North Carolina, and won a name in literature as the editor of *World's Work*, was sent as ambassador extraordinary to Great Britain in 1913. A few months later Thomas Nelson Page, who had been born in Hanover County, Virginia, April 23, 1853, was named as ambassador to Italy. When the Virginia author was selected to the post, a flood of letters came to Walter Hines Page in London, just as a little earlier, many such letters had come to Thomas Nelson Page at Washington, D. C. The sequence of events disclosed a strange pact between the two Pages.



"Many years ago Tom Page and I began to get each other's mail," explained Walter Hines Page, "so we made an agreement that when we opened it by mistake we would promptly forget its contents."

Now that he is well fortified on the shelves of literature, Thomas Nelson Page sometimes refers to himself as a "reformed lawyer." It was during the idle hours in his law office that he first made his start up the literary hill. He had been educated at Washington and Lee University and took his law degree at the University of Virginia, in 1874.

"My standing was not high," said Mr. Page. "I don't know that I had much ambition to be one of the first honor men. At any rate, I got no medals of any kind. I suppose I was a fair, average student, but I hear that I devoted myself more to outside reading than to my studies. I was a member of the literary society, and for a time was the editor of the college paper. Contrary to the usual custom, I wrote short articles instead of long essays, and from this got the nickname of 'Short Article Editor.' I wrote, I suppose, much for the pleasure of seeing myself in print. I was very bashful in those days, and I know that I trembled when I first got up to speak in the literary society. I had a chum at college who is now one of the most famous lawyers of the country. He excels as a debater. He also was bashful, and during our college days he joined with me in a method of improving our oratorical powers. We would get together in a room, and, having closed the doors, would debate with each other on some question. One would stand on one side of the table and one on the other, and we would declaim away, each having 15 minutes' speech and a like time for answers. This practice helped me materially in my work as a lawyer."

Mr. Page hung out his shingle at Richmond. One day a client entered his office and showed him a letter which a sweetheart had sent to a soldier on a southern battle field. The epistle was so pathetic that it haunted him. He went to his office and wrote the story of "Marse Chan." Its publication made him famous as an author of the peculiar Negro dialect of Virginia. Although he was paid only $80 for it, the sale of his manuscript established him safely on a literary career.

"A friend showed me a letter which had been written by a young girl to her sweetheart in a Georgia regiment," explained Mr. Page, "telling him that she had discovered that she loved him, after all, and that if he would get a furlough and come home she would marry him; that she had loved him ever since they had gone to school together in a little schoolhouse in the woods. Then, as if she feared such a temptation might be too strong for him, she added a postscript in these words: 'Don't come without a furlough; for if you don't come honorably I won't marry you.' This letter had been taken from the pocket of a private, dead on the field of one of the battles around Richmond, and, as the date was only a week before the battle occurred, its pathos struck me very much. I remember I said, 'The poor fellow got his furlough through a bullet.' The idea remained with me, and I went to my office one morning to write 'Marse Chan,' which was finished in about a week."

THOMAS NELSON PAGE

The Old South

By THOMAS NELSON PAGE

IT WAS a goodly land in those old times—a rolling country, lying at the foot of the blue mountain-spurs, with forests and fields; rich meadows filled with fat cattle; watered by streams, sparkling and bubbling over rocks, or winding under willows and sycamores, to where the hills melted away in the low, alluvial lands, where the sea once washed and still left its memory and its name.

Why should not Miss Thomasia in her faded dress, whom you shall meet, tell us, if she pleases, of her "dear father," and of all her "dear cousins" to the remotest generation; and Dr. Cary and General Legaie quote their grandfathers as oracles, alongside the sages of Plutarch, and say, "Sir" and "Madam" at the end of their sentences? Antiquated, you say? Provincial? Do you, young lady, observe Miss Thomasia the next time she enters a room, or addresses a servant; and do you, good sir, polished by travel and contact with the most fashionable—second-class—society of two continents, watch General Legaie and Dr. Cary when they meet Miss Thomasia, or greet the apple-woman on the corner, or the wagoner on the road. What an air suddenly comes in with them of old Courts and polished halls when all gentlemen bowed low before all ladies, and wore swords to defend their honor. What an odor, as it were, of those gardens which Watteau painted, floats in as they enter! Do not you attempt it. You cannot do it. You are thinking of yourself, they of others and the devoirs they owe them. Even you, Miss or Madam, for all your silks and satins, cannot do it like Miss Thomasia. You are at best an imitation; Miss Thomasia is the reality. She belongs to the realm where sincerity dwells and the heart still rules—the realm of old-time courtesy and high breeding, and you are the real provincial. It is a wide realm, though; and some day, if Heaven be good to you, you may reach it. But it must be by the highway of Sincerity and Truth. No other road leads there.—From "Red Rock."

Popularity was delayed through the neglect of editors. Mr. Page was an unknown writer, and although his story was accepted and paid for, it was several years before it appeared. One day he wrote to the editor about it and a few days later received the proof sheets. With its appearance in 1884 calls for his literary products increased until finally in 1893 he gave up his law practice for literature.

Before he abandoned the law he had made a success of its practice. In six months after opening his office he was self-supporting. During the 18 years of practice his income was chiefly from law.

Although he is approaching the seventieth milestone, like James Lane Allen, his contemporary from Kentucky, Mr. Page is still engaged in literary work. A row of his books bound in a bluish-gray cover adorn the walls of the library in his big colonial home in Washington, D. C. Among them are: "In Ole Virginia," 1887; "Two Little Confederates," 1888; "On Newfound River," 1891; "The Old South," 1891; "Among the Camps," 1891; "Elsket and Other Stories," 1892; "Unc' Edinburg," "Meh Lady," "Marse Chan," "Polly," "Social Life in Old Virginia," "The Old Gentleman of the Black Stock," 1896 (revised edition, 1901); "Two Prisoners," 1897; "Red Rock," 1898; "Santa Claus's Partner," 1899; "A Captured Santa Claus," 1902; "Gordon Keith," 1903; "The Negro—The Southerner's Problem," 1904; "Bred in the Bone," 1905; "The Coast of Bohemia" (poems) 1906; "Under the Crust," 1907; "The Old Dominion—Her Making and Her Manners," 1908; "Robert E. Lee, The Southerner," 1908; "Tommy Trot's Visit to Santa Claus," 1908; "John Marvel, Assistant," 1909; "Robert E. Lee, Man and Soldier," 1912; "The Land of the Spirit," 1913; "Life of Thomas Jefferson" (in Italian), 1918; "Italy's Relation to the War," 1920.

"I would say that I do not know whether 'Marse Chan,' 'Meh Lady,' 'Unc' Edinburg' or some other stories gave me the most pleasure in writing," answered Mr. Page when I asked him to characterize his own writings, "but you know that writing is by no means all pleasure. There is also a certain travail about it."

There is a great deal of sympathy in the heart of Mr. Page. He is seldom a lecturer and rarely reads his works in public. To this rule there is one exception. During the winter months in Washington he gives two or three readings to the blind in that city—selections from his shorter dialect stories and from "Red Rock," which is one of the most thorough and pretentious novels on the reconstruction period following the Civil War. Among these sufferers he is known by the sobriquet of "The Eyes of the Blind."

Thomas Nelson Page is a man of robust physique and strong personality. He looks more like a bank president, or a prosperous business man than he does an author. His early life as a boy on the old plantation, where he milked cows, tended the cattle and read his Thackeray and Dickens by the flickering light of a pine knot in those troublesome days before the Civil War, has given him a heritage. The South which he pictures is not the South of today. It is the South of his boyhood, before the war; the South of romance, chivalry and wide hospitality.

"But for those who knew the old country as it was then, and can contrast it with what it has become since, no wonder it seems that even the moonlight was richer and mellower 'before the war' than it is now," said Mr. Page recently. "For one thing, the moonlight as well as the sunlight shines brighter in our youth than in mature age; and gold and gossamer amid the rose bowers reflect it better than serge and crepe amid myrtles and bays. The great thing is not to despond even though the brilliancy be dimmed; in the new glitter one need not necessarily forget the old radiance."

"Do you have regular hours for writing?" I asked Mr. Page.

"I have no regular hours for writing or for doing anything else," came the reply without a moment's hesitation. "I rarely, I might say, never, write until I find myself bored by not doing it.

"I write the first draft as rapidly as I can and then go over it very carefully in the revision. I try to simplify my writings as much as possible. The more simple it is, I think, the better it is. I find, however, that the revision often takes away the spirit from the first draft. I lay away the manuscript, and looking at it several weeks later, I can see that the first draft is truer to nature than the more stilted revision. I think I do more careful work now than I have done in the past. My ideal is far above anything I have ever done, and I sometimes despair of approaching it. There is one thing I do, however, which I think is a good plan for any writer. I always give the best I have in me to the story I am writing. I do not save anything which I think might perhaps be of use in the future. The cream, if you could use that expression, always goes to the present.

At times Mr. Page is a militant advocate for social reform. A few years ago his denunciations of the morals and manners of fashionable society at some of the country's resorts riveted attention on him. He characterized them as "the gilded imitators of foreign fashionable life living in a ditch of profligacy." When some of the leaders of this society replied that 50,000,000 people in this country were interested in the doings of the fashionable set he came forth from Newport with these stinging phrases:

"I may say that there are not only 50,000,000 people in this country who sit with envious, even adoring gaze, feasting upon that spectacle of divorced and doubly divorced men and women, their sycophants and parasites, but that outside of their own circle, there are not 50,000 people in all the country who do not reprobate and deride their arrogance."

In all the clamor and protest that followed he never retracted a word; never recanted a sentence.

Fifteen years ago, on the publication of Mr. Page's books in a uniform edition, it was predicted that his career was ended. Since then half a dozen books have come from his pen. He has done for Virginia and the old plantation society of the South what Hamlin Garland did for the changing West and Bret Harte for the early scenes of California.

The Federal Government and Its Employes

Keeping 600,000 Places Filled With Competent Workers a Problem

By MARTIN A. MORRISON

Former President of the United States Civil Service Commission

PRIVATE business and public business are close brothers, and what daily concerns them is so interwoven that any lack of full efficiency or any delay in public business, for example, must seriously affect private business and the general welfare. The functions of the Civil Service Commission bring it into close touch with personnel conditions throughout the country.

It is estimated that the number of residents on American soil 10 years of age or over who are engaged in gainful occupations is about 47,000,000. The civil service of the United States on December 31, 1920, the last report available, employed approximately 640,175 workers, or one in 73 of all workers in the country. Another evidence of the extent of the Federal service is the fact that probably every phase of human activity is touched in some measure by government workers, there being approximately 1,700 different kinds and grades of work represented.

At the height of the war expansion nearly 1,000,000 persons were employed in the civil service of the United States; and although reductions are constantly being made it seems most improbable that the pre-war figure of less than 500,000 workers will again be reached.

The problem of reducing the Federal working force is one that is uppermost in the public mind, and impatience seems to exist in certain quarters because the decrease in the total number of the government's employes manifests itself so slowly.

It should be remembered, however, that the Congress has added greatly to the duties of many branches of the executive service and has created some bureaus which did not exist before the war, such as the Bureau of War Risk Insurance, the Federal Prohibition enforcement offices, the Vocational Board, the expanded Public Health Service, employing thousands of persons.

Larger appropriations, too, necessitate larger clerical forces. It requires more bookkeeping to administer the expenditure of $4,000,000,000 than it did for $1,000,000,000.

The Bureau of Internal Revenue, Treasury Department, has a greatly increased force to collect the taxes and to administer the Prohibition Act. The Bureau of War Risk Insurance, which did not exist prior to the beginning of the war, now has about 7,000 employes. The adjutant general of the army needs a much larger force than his pre-war staff to perfect and maintain the records of 4,000,000 more soldiers.

Other Federal bureaus have expanded, to keep pace with the increased activities of the nation. There are any number of examples of the many instances of the direct connection of governmental functions with private business; and it needs must follow that any marked weakness in the government will have serious consequences on industry generally.

The lapse of time between Armistice Day and the present has afforded some opportunity to consider the lessons taught in the urge and strain of war and the problems now pressing for solution. An altogether rosy picture cannot be painted concerning the personnel situation of the government, and it is believed that the carrying into effect of certain recommendations is essential to the best interests of the service.

The more important problems which have been faced recently by the Civil Service Commission have been the demobilized soldier, the released civilian war worker, and the resumption of activity by the general departments of the government.

Very often there is a tendency to believe that the Civil Service Commission has absolute and mandatory powers in connection with the Federal service, and that any imperfection or wrong may be straightened out by the commission. But such is not the case. The civil service rules do not give to the Civil Service Commission any power of appointment or removal. This fact should be well understood. That power is left where it was prior to the enactment of the law, namely, in the President and the heads of departments. Upon the requisition of an appointing officer, the commission provides eligibles procured as the result of competitive examination. From the eligibles provided the appointing officer makes selection and appointment. When certification is made the commission's duty ends so far as an appointment is concerned, except to require, if an appointment is made, that it be made in accordance with the rule regarding selection. The commission is charged with investigating and reporting any irregularity in appointment or removal. But, to repeat, it has no power in appointing or removing.

The civil service law was intended to cure in part the evils traceable to the "spoils system," which grew out of the four-year Tenure of Office Act of 1820. Its fundamental purpose was to establish, in the parts of the service covered by its provisions, a merit system whereby selections for appointment should be made on the basis of demonstrated relative fitness, without regard to political, religious or other such considerations. To carry out this purpose a plan of competitive examinations is prescribed. There is a provision which apportions the number of appointments in the departments at Washington among the states, but this provision concerns appointments and not dismissals.

On December 31, 1920, there were 640,175 employes in the various branches of the Federal executive civil service, as compared with 439,798 on June 30, 1916. On the latter date 39,259 employes were in the city of Washington, while on June 30, 1921, the number had increased to 82,051. This number, by the way, does not include positions to which appointment is made by the President without confirmation by the Senate, and all positions in the Library of Congress, in the District of Columbia government, in the legislative branch, in the judicial branch, in the Pan-American Union, in the Emergency Fleet Corporation, in the War Finance Corporation, in the Railroad Administration, in the Federal Farm Loan Board, under the endowment fund of the Smithsonian Institution, in the Federal Reserve Board, and a few others.

The civil service law expressly states that the examinations required by its terms shall be practical in their character, and, so far as may be, shall relate to those matters which will fairly test the relative capacity and fitness of the persons examined to discharge the duties of the service into which they seek to be appointed.

These examinations have been framed to fit the job to be filled. Yet it is quite common even now, on the establishment of some new office or service, for the newly appointed head of such office to plead that his force of employes should be excepted from the requirements of competitive examination because the kind of employes he needs are not scholars who can tell the distance "from the earth to the moon," and should not be called on to take *the* civil service examination, as if there were but one kind.

It is common for one in the habit of selecting employes through the means of oral interview to think that they cannot be properly selected in any other way. But the experience of the commission has proved in thousands of cases that the oral interview alone is far from an adequate test of fitness for all kinds of employes, or even office workers.

Notwithstanding the fact that the civil service force is steadily diminishing, the need still exists of advertising for applicants for some positions, because the natural turnover in a force so large requires some appointments to fill vacancies, even though the total force is being reduced. Two conditions necessitate some new appointments and announcements of new examinations. One of these is that there are a number of technical positions to be filled from time to time for which reemployment registers do not provide eligibles. The fact that some offices are dismissing clerks does not help the commission in its effort to fill a position of civil engineer, for example. The other reason is that the salaries now offered by the government in the clerical grades are, in many cases, unattractive, and employes dropped from war bureaus declined to accept them and returned to their homes outside the District of Columbia. The re-employment registers are made up of names of employes who have been dismissed from the service because of the necessary reduction of force and not for inefficiency.

Discharged service men and women in great numbers are profiting by the opportunity for employment which is offered by the law that provides that men who have been honorably discharged from the Army, Navy or Marine Corps, widows of such, or wives of those seriously disabled, shall be given preference in making appointments to clerical and other positions in the executive branch of the government. Thus far the commission has received about 80,000 claims for preference. Approximately 4,500,000 persons are entitled to preference should they desire to enter the government service. Every possible effort has been made to aid soldiers and sailors or their widows and the wives of injured service men in procuring appointment.

Recently the problem of women in the government service has been the subject of attention by the people, but not always with a thorough understanding of the circumstances involved.

The proposition of women examined and appointed, as compared with men, increased tremendously during the war period, as is well known. But it is not expected that the same proportion will be maintained in the future.

Before the United States entered the World War men outnumbered women in the Federal civil service by about ten to one. The war effected a material change. At the present time, after the return to civil life of former soldiers, sailors and marines, and after extensive reductions in the war personnel, women hold in the government service, at the lowest estimate, 50 per cent of those positions which they ordinarily seek. A further evidence of the trend of the times is the steadily increasing number of women appointed by the President to offices of importance.

By sex the average salary for 63,128 men was $1,220 and for 21,848 women, 1,047, the average being $1,176. The lower average salary for women is due to the large proportion of men appointed to higher technical and professional positions. Women apply in larger numbers for the ordinary clerical positions, which carry lower salaries, although all examinations are open to them on the same basis with men.

The congressional bonus of $240 per annum, applicable to a large part of the service, was not included as salary. The bonus, therefore, amounts to but little more than 20 per cent of the average entrance salary, and since it is not ordinarily given from the beginning of service it should not be added in full to the average salaries to determine the actual amount received by employes. This clearly refutes any claim that salaries for original entrance have been materially increased.

The government force of employes may be divided into three general groups, as follows: (1) Unskilled manual labor; (2) mechanical trades and similar positions, and (3) clerical, supervisory, technical, scientific and miscellaneous positions. With respect to the first two groups named, it is not found that abnormal conditions exist in marked degree in the government service. In these two classes conditions of employment and wages in government establishments compare favorably with those in private industry. Therefore the turnover in the government service so far as these two grades are concerned, while great, is probably not so great as in private employment. In the third group, however, the class which is made up of at least two-thirds of the entire force, abnormal conditions do exist to so great an extent that the turnover is greater than any private business could possibly withstand.

Apart from the low salaries paid, there are two other reasons for the heavy loss in trained employes, such as legal restrictions on transfers between the departments and the salaries which may be paid, and the anomaly of filling certain inferior positions through the test of merit under the civil service law while excluding from the scheme large numbers of higher positions which should stand as rewards for meritorious service.

Until recent years the government has been able to retain its men on the average nearly as well as the colleges and industries. During the past few years, however, circumstances in this respect have changed. While the cost of living has nearly or quite doubled and salaries in the industries have considerably increased, Federal salaries have increased very little, and in the higher grades hardly at all. The result is that the workers cannot support their families and are obliged to seek employment at living salaries.

The legal restriction imposed on transfers makes impossible the correcting of a misassignment in the case of an employe originally appointed in a department for whose work he is unfitted, but who might be fitted for the work in another department. The second restriction prohibits that such transfers may not be made at a higher salary if paid from a lump fund. These laws were no doubt passed with a view to procuring stability in the service, but experience clearly establishes that they are having the opposite effect.

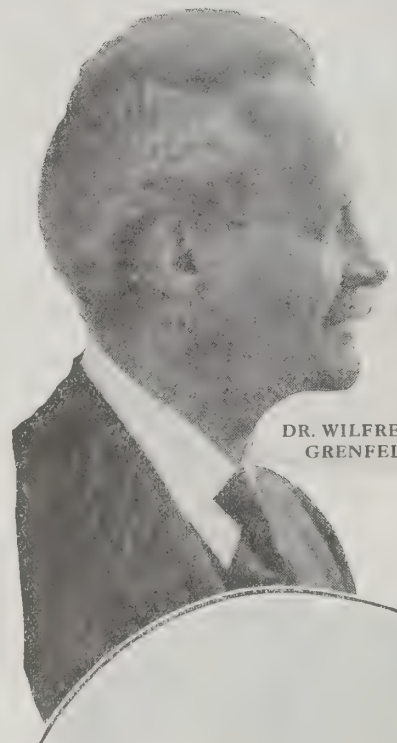
In view of all this, the Civil Service Commission does feel the necessity for urging on the Congress that it pass as early as possible some bill making a real beginning toward reclassification of duties and positions and providing more adequate salaries equally for all employes of the government as a whole engaged on the same class of work.

There has been no readjustment of salaries in the departmental service for more than 60 years. During this period salaries have remained stationary, but the same cannot be said of the cost of living.

Reclassification, therefore, on a basis of duties and more adequate pay represents the pressing needs of the service. There are other changes whose consummation would result in good to the government and would be in line with an effective business policy. Among these are removing statutory limitations on transfers and returning to the practice of permitting the President to prescribe limitations in civil service rules; and including in the classified service to a larger number of the administrative non-policy forming positions to which promotions of qualified employes may be made.

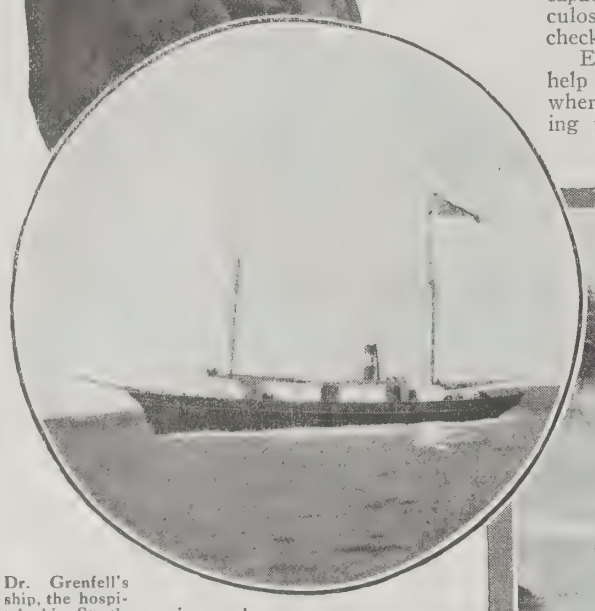
Civil Service Problems

APPROXIMATELY 600,000 persons are in the civil service of the United States. It is probable that every phase of human activity is touched in some manner by these workers. They received their appointments through competitive examinations. These workers not always are efficient, and when they are not the public feels it.



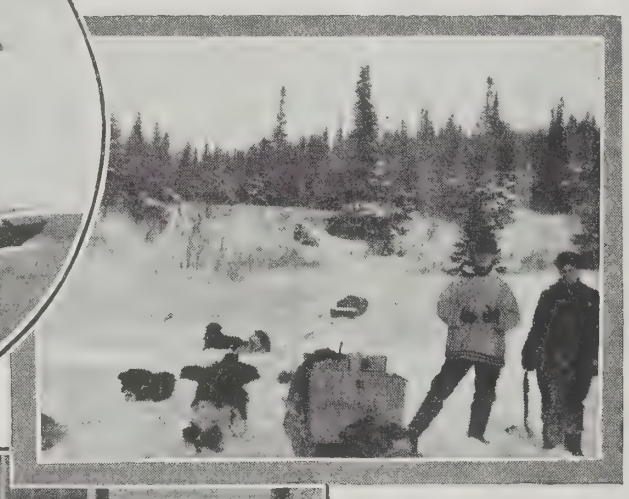
It is one of the problems of the Civil Service Commission to obtain competent workers through competitive examinations. This was next to impossible during the war period, and even now this condition prevails to a considerable extent. The principal reason for this is the low salaries paid by the government. Thousands left the service for higher salaries elsewhere during the war and the boom period that followed. With the mounting cost of living they could not support their families on the wages paid by Uncle Sam. The civil service thus lost many of its most efficient workers. Their places had to be filled, and about 500,000 additional had to be appointed to do the work made necessary by the war.

The force has been greatly reduced from the high mark, but the same old problems confront the Civil Service Commission with regard to new appointments, efficiency and salaries. New legislation is urged to solve all the problems of the service.



His Richest Fee Was a Poor Man's Tears

Dr. Grenfell's Thirty Years in Bleak Labrador Epic With Brave Service and Thrilling Adventure



By EARL CHRISTMAS

DR. WILFRED T. GRENFELL

Dr. Grenfell's ship, the hospital ship Strathcona, is a welcome guest in every bay and inlet along the Labrador coast.

Often in answering calls for his assistance, Dr. Grenfell travels through a frozen wilderness.

Above—Pupils in one of the schools established by Dr. Grenfell and his associates. Below—Dr. Grenfell has developed a string of hospitals and nursing stations along the coast of Labrador and Northern Newfoundland.

AMONG those who despise the easy paths, place Dr. Wilfred T. Grenfell. Giving up a comfortable life in England to serve as a doctor with a mission to Labrador, he has spent 30 years ministering to the fisherfolk along this bleak coast.

Battling through icy seas or over frozen wastes, he has led a life of rare adventure—and service. Once, seeking to reach a patient, he lost his way and spent a whole night and part of a day perilously adrift on an ice pan in the ocean. Yet, he revels in the life of a Labrador doctor, and year after year has gone on expanding his field of activities. Healing the sick is only a small part of the work of the Grenfell mission. The doctor's ship, the S. S. Strathcona, plies up and down the Labrador coast, a veritable ship of mercy, a friend in need to all the coast. A welcome guest in every bay and inlet along the coast, it brings food for the hungry, carries clothing to the needy, picks up orphans and widows and dispenses good books and literature.

The Grenfell organization is a unique medical and social mission. It includes hospitals, homes for orphans and a seaman's institute. Schools have followed in the wake of the mission's growing activities. Not only has the mission developed two permanent schools and a string of summer schools, but children, selected from the schools, have been sent to the United States for technical training.

Along with the educational work have come steps to promote the industrial welfare of the people. Finding the fishermen in a form of slavery under the old barter system, Dr. Grenfell braved the most powerful opposition of the traders to establish co-operative stores. The stores proved a success, and scores of families have been made independent. He has introduced industries to supplement the meager living obtained from the fisheries. He has fought the liquor traffic among the fishermen, and fought it successfully. This outlines in but the briefest way the work of the Grenfell mission, but it shows into how many directions and into what different phases the energy of this pioneering doctor has expanded. Dr. Grenfell has traveled thousands of miles up and down the Labrador coast, in a steamer by summer and in dog sledge by winter. He has been the first and only doctor in scores of humble homes along the icebound coast.

Speaking of the days when he began his work, Dr. Grenfell recalled:

"One man had a dislocated hip. It had been out of joint for 10 years. Nobody had tried to do anything with it, and all this time he had gone around with one leg dragging behind.

"The crippled and blind halted through life. The torture of an ingrowing toenail had incapacitated one poor father for years. Tuberculosis and rickets carried on their work unchecked."

Even now the doctor finds the need for his help extremely urgent. At each little coast town where he stops, he finds men and women waiting for his attention, and frequently in winter, when he must depend upon his dogs, messengers come 50 and 60 miles for his assistance.

In Okkak, during the influenza epidemic, more than 200 people died in three weeks and eventually 253 out of 300. Every single man was included in that death roll, leaving no one to provide for the 60 women and children. Influenza took an appalling toll in many other sections, too.

It is a trying life Dr. Grenfell lives, and one full of adventure. For instance, there is the story of his adventure upon the ice pan, a thrilling story, yet only one of many unusual experiences in the life of the Labrador doctor.

Going one winter to answer an urgent appeal for assistance from a point 60 miles away, Dr. Grenfell drove his dog team across the ice in a bay that he might save several miles on his journey. The time saved might mean life or death to his patient, and the ice seemed to be firm. The wind was blowing in from the sea.

As he neared the farther shore, he discovered that he was traveling on "sish" ice, which is made up of small pieces of ice churned up by the pounding of the heavy ice pans by the sea. The wind, which had been blowing landward, veered suddenly and the ice, held together less firmly, began to separate.

Soon, Dr. Grenfell found himself sinking into the icy water. The lead dog climbed up on a piece of frozen snow in the water, and after much effort, the doctor, by following the lines of the harness, was able to pull himself on to the ice. But he saw that this refuge soon would crumble beneath him. He finally induced the lead dog to swim to an ice pan about ten feet square, the largest piece he could see.

Eventually, the doctor and his dogs were cuddled up on this ice pan. There was nothing to do but stay there. With the wind changed, he drifted steadily out to sea, and night found him some 10 miles on his seaward journey. A bitterly cold wind was blowing down across the bay.

Dr. Grenfell saw that to keep from freezing he would have to kill some of his dogs and use their fur in which to wrap himself. After considerable difficulty, he killed three dogs and wrapped himself in their skins.

All that night, he drifted on the icy ocean, suffering intensely from the cold. As morning approached, he took the frozen legs of his dead dogs, tied them together for a staff and sacrificed his shirt for a flag. There seemed small chance of rescue, even though he should be seen, for the water was filled with great churning pieces of ice near shore. He had little hope a boat could get through it.

Daylight came, and the morning wore on. Several times he thought he saw men along the shore, but was mistaken.

Suddenly, he saw the flash of an oar. He waited, still skeptical of his sense of sight. Presently he could make out a boat. Rescue was at hand. A fisherman, whose good eye had seen a black speck on the ice the night before, had organized a rescue party, and the party now was well on its way.

When he recovered, Dr. Grenfell placed a memorial tablet in the hall at St. Anthony, where his headquarters are located. On this tablet were these words:

"To the memory of three noble dogs, Moody, Watch and Spy, whose lives were given for mine on the ice April 21, 1908."

Dr. Grenfell and his associates have brought back many interesting stories of the fisherfolk. The log of a recent journey contains these rather significant items:

"On my return voyage I called at a harbor some six miles away from the family just alluded to. A smiling fisherman said, 'I sent over some milk and butter and supplies to B.' I asked him for the bill. 'No, indeed,' he said, and I saw his kindly eyes dancing, and I was glad for I knew he had troubles of his own.

"We found L. H. with pneumonia. I sent an order for food, ordering one-third more than the money sent, but the bill came back receipted, and the merchant had written below the difference, 'my share.' Doesn't that do one good?

"Once I made a long trip to see an old fisherman—'Uncle George,' we called him. He had sent word that he needed me, and I knew that someone was sick. When I arrived, he had something ready for me to eat, though he apologized because he didn't have any sugar for the tea, nor any milk. He felt very keenly about not being able to get these things for me.

"I went to the sick room and found an old man very ill with a cancer, while his aged wife was crooning an old song. I did what I could, and as I prepared to go, I asked Uncle George who the sick man was. He said 'only a neighbor.' Though he couldn't buy any sugar for himself, he had kept this neighbor and his wife for a year.

"When I left, he came down to the boat with me, and, standing there on the beach with tears in his eyes, he said he didn't have anything to pay me, but that he was very grateful for my coming to see his neighbor. I can see him yet standing there, with his white hair flowing in the breeze and that kindly face as he said, 'I can't pay you.' *Pay—I never had such pay in all my*

(*Concluded on page 15*)

Bells of the World That Toll for Joy and Grief

Their Big Part in Our Daily Life

By CARL SCHURZ LOWDEN

THE alarm clock awakens you. It commits the deed with a little but mighty bell. Before you are fully dressed the telephone insistently summons you with its ringing. As you hang up the receiver your ears are assailed again and at first you think it is the burglar device recently installed; instead it is the doorbell.

You catch a car. The conductor rings the "go ahead," and rings up your fare. Soon a wagon obstructs the motorman's path, and he takes his morning exercise by kicking the button that works the gong that is merely another form of bell. Next a passenger rings to get off, the car stops, and just then Fido comes jogging along with bells on his collar.

Presently you hear a thrilling sound and you guess that it is an ambulance. No, you are wrong. The fire laddies are on their way to battle flames somewhere in the city. Soon, however, an ambulance does pass with its bell madly clanging. Somebody, perhaps a victim of the fire, has been injured. You may possibly reach your office without encountering the bell-heralded patrol wagon.

And if you live in the country you find that when snow covers the ground, sleighs venture out; and the horses that draw them invariably wear necklaces or belts of jingling-jangling merry bells. In the old days every town had a crier who carried a bell. Then it was, too, that every farmer belled his cows and belled his sheep so he could find them readily in the woods. The custom of belling the domestic animals faded away as the ax got in its work of clearing the land.

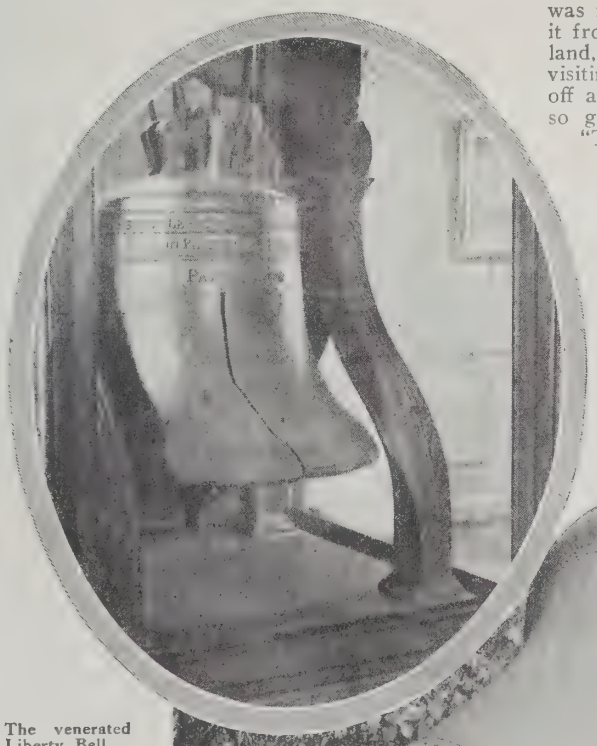
When watches were scarce and high-priced, the farmer plowing his fields depended on a big, heavy, stout, sonorous bell to call him to dinner. Now the dinner bell has virtually passed on. Its big brother, the church bell, has survived; but it is sentiment and not genuine need that has kept it on duty.

The world is full of bells, and I have named only a few of them. Just consider what the old world would be like without these messengers of joy and grief, of gladness and sadness. It would be a changed world indeed.

(C) Publishers Photo Service

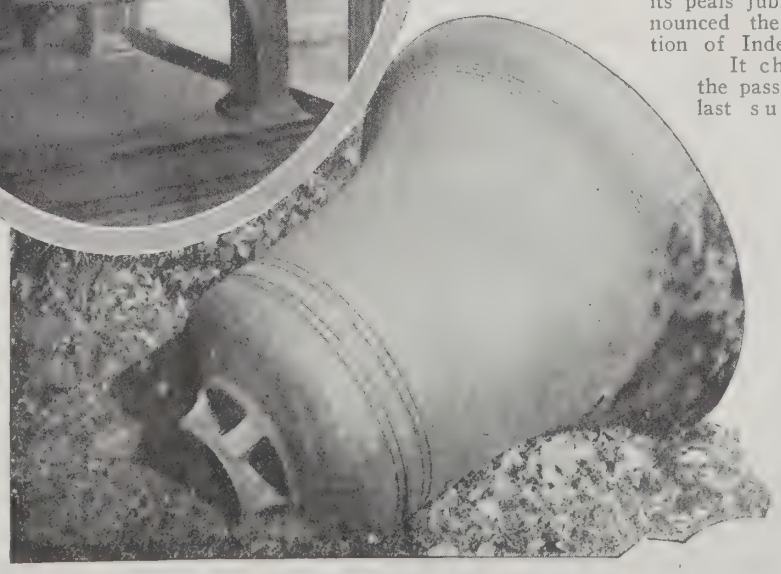
The bells in the old cathedral of Panama City, Panama.

At Weymouth, Massachusetts, the traveler may see a bell abandoned in a field. Cast in 1860, boys and girls of the Sunday school of the First Baptist Church saved their pennies and purchased it six years later. It was mounted in the belfry, where it served well for five years. Then it cracked and was taken down. Nobody wanted the bell. Finally, some person convinced the town government that it could be used as a watering trough in Lincoln Square. With a longer lease on life, the bell survived in this somewhat undignified but utilitarian rôle until 1886. Then Weymouth put in its modern waterworks; and the huge cast piece that originally summoned people to worship in the church and the children to Sunday school was carted out rather ignominiously to the edge of a woods, where it was dumped to be out of the way.



Without a doubt the most famous bell in this country is that one of patriotic remembrance which has inscribed on its head the biblical quotation, "Proclaim liberty throughout all the land unto all the inhabitants thereof." Now it is cracked and useless, but it has not and never will be abandoned in a field to waste away in the form of rust.

For many years, however, the Liberty Bell was neglected. And who do you suppose saved it from continued obscurity? A son of old England, who afterward became Edward VII, was visiting the United States in 1860, when he stopped off at Philadelphia and saw the object which we so greatly venerate now.



"This old bell," said the then Prince of Wales, "is the greatest relic this republic has today. Instead of being here, covered with the accumulated dirt, it should occupy the chief place of honor in this Hall of Independence. It is to you what the Magna Charta is to England. It is cracked, but it is an inspiration."

Oddly enough, but also logically, the bell was cast by an Englishman, Thomas A. Lester, in London, in 1752. At that time it did not have the liberty proclamation on it.

What school child does not know of its ringing on the fourth day of July, 1776, when it lived up to its motto and its peals jubilantly announced the Declaration of Independence! It chronicled the passing of the last surviving signer of the Declaration. In 1834 it performed the same duty for Lafayette, and a year later it was being tolled for Chief Justice John Marshall when the crack developed.

The venerated Liberty Bell.

The abandoned bell of Weymouth, Massachusetts.

(C) Boston Photo News Co.

The Liberty Bell is small, weighing only one ton. Just compare its size with the world's biggest bells, as follows: "The Great Bell of Moscow," 222 tons; St. Ivan's, Moscow, 64 tons; St. Paul's, London, 19 tons; "Big Ben," Westminster, 15 tons, and St. Peter's, Rome, 18,600 pounds, or more than nine tons. Other large bells that range in weight from 14 to 60 tons may be seen at Peking, Vienna, Montreal and at Olmutz, in Bohemia.

"The Great Bell of Moscow" is 19 feet 3 inches high and has a rim circumference of 60 feet 9 inches. St. Ivan's, also of Moscow, has a circumference of 40 feet 9 inches, but a weight considerably less than one-third that of its prodigious neighbor.

The Bell Tower of the Kremlin in Moscow contains 34 of these musical pieces. Two are made entirely of silver. This is perhaps the most impressive set of large bells in the world today.

Bishop Paulinus, of Nole, Campagna, is thought to have been the first man to use a bell to summon a congregation to religious services. This was about 400 A. D.

Bells had not come into general use even as much as two centuries after they had been first employed in Campagna. About 900 A. D., Pope John IX decreed, or ordered, that bells should be used in the churches under his control.

Though the custom of announcing the time of worship by the sounding of bells began in the reign of Constantine, or approximately then, the English were the first to employ them widely for this purpose. Perhaps no people love the metallic messengers of weal and woe as they do; they seem to have a peculiar affection, a veneration that amounts almost to superstition, for bells.

According to history, the rise of Gothic architecture and the introduction of church bells very largely coincided. This style of architecture provided numerous towers and spires which were suitable as supports for bells; the low buildings of the preceding period had offered no adequate housing facilities.

When the Spaniards invaded Mexico and South America they introduced there the custom of using bells in places of worship.

The most musical bells in the whole world are said to be those in the "low countries" of the Netherlands and Belgium. In these lands there are more carillons and chimes than of any other type.

The cathedral at Utrecht in the Netherlands houses carillons that possess tones unusually sweet. Every hour and half hour they are played. Carillons that rank next in beauty of tone to those of Utrecht may be found in the cathedral of Bruges, the ancient town of Belgium.

The Case Against the Industrial Court Idea

An Argument for Arbitration Plus an Industrial Code

By REV. JOHN A. RYAN, D. D.
Director of the Department of Social Action, National Catholic Welfare Council.

GOVERNOR ALLEN, of Kansas, has made several addresses throughout the country, in which he offers the Industrial Court of his state as an effective means for prevention of strikes. He has written a book on the subject. There is a bill before the New York legislature for the establishment of a similar court in that state. Thirty thousand manufacturers have asked Congress to create a similar Federal Court. A large number of disinterested persons are persuaded that such an institution is the one definite agency required for the prompt and satisfactory adjustment of industrial disputes and the abolition of industrial strife. The theory of the Industrial Court is so simple that it makes a ready appeal to that vast body of Americans who do not realize that our industrial relations are far from simple. This faith is mistaken and misplaced.

Judge Huggins, chairman of the Kansas Industrial Court, declared: "The Kansas Court of Industrial Relations is emphatically not a tribunal for arbitration. It is, therefore, fundamentally different from the labor courts of Australasia. The Kansas law is based upon the principle of adjudication, not arbitration. None of the three members of the court has any interest in the controversy. It is intended that they shall be as impartial, and, if you please, as ignorant, as the judges of the supreme court of the state. The law provides for the adjudication of industrial controversies in the same orderly way, by the same kind of tribunal, as has been used in the adjudication of all other classes of controversies for hundreds of years. The Anglo-Saxon people in general accept without question the authority and jurisdiction of their courts to adjudicate all matters affecting the life, the liberty, and the property of the citizen. If a man's right to live is justiciable, if his liberty, which to the Anglo-Saxon is dearer than life itself, can be taken away from him by the judgment of a court, surely disputes as to wages, hours of labor, and working conditions are also subject to adjudication by the courts. A man who has no faith in the courts, has no faith in, and no love for, democratic institutions."

Courts Differ Fundamentally

BETWEEN the Industrial Court and an ordinary court the dissimilarity is much more important than the similarity. The ordinary civil court deals with disputes between human beings; so does the Industrial Court. Both courts have facilities for obtaining the evidence upon which to base a decision. Here the similarity ends. When we come to the supremely important question of the law which is to guide the court in its decision, we find that the difference between the two situations is fundamental.

Suppose that two men have a dispute over the damages inflicted upon the property of one by the other. Once the court has ascertained the facts, it can make a decision in accordance with ample legal standards. These are of three kinds: First, the constitutional rights of the litigants, for example, they may not be deprived of life, liberty, or property, without due process of law; second, there is the statute law, the law made by legislatures, and, third, there is the common law, consisting of a long series of judicial precedents, embodying the experience and wisdom of judges during several centuries of dealing with similar cases. On the other hand, when an employer and employe come into the Industrial Court with a dispute about wages, the members of the Kansas tribunal have no law whatever to guide them in the adjustment of the conflicting claims, except that vague requirement that the wage should be "fair and reasonable," and that capital is entitled to a "fair return." As a consequence, the court must make its own law. This is contrary to all theories concerning court functions.

Measure for Wage Standards

NEVERTHELESS, a spirit of fairness dictates the observation that the "law" actually made by the Kansas court is, considering all the circumstances, approximately just, at least as regards wages. In the Joplin and Pittsburgh case, April 23, 1920, we find the following: "In determining a fair wage, the court should take into consideration among other relevant circumstances:

1. The scales of wages paid for similar kinds of work in other industries;
2. The relation between wages and the cost of living;
3. The hazards of the employment;
4. The training and skill required;
5. The degree of responsibility;
6. The character and regularity of the employment; and
7. The skill, industry and fidelity of the individual employe."

The court also declared that *"wages to labor should be considered before dividends to the investor, and that a business which is unable to pay a fair rate of wages to its employes will eventually have to liquidate."* In the Topeka-Edison case, the court defined a "fair wage" for faithful and skilled workers in the following language: "Such persons, in all fairness, are entitled to a wage which will enable them to procure for themselves and their families all the necessaries and a reasonable share of the comforts of life. They are entitled to a wage which will enable them by industry and economy not only to supply themselves with opportunities for intellectual advancement and reasonable recreation, but also to enable the parents working together to furnish to the children ample opportunities for intellectual and moral advancement, for education, and for an equal opportunity in the race of life. A fair wage will also allow the frugal man to provide reasonably for sickness and old age."

Arbitration is better than adjudication. In his speech before the Rotary Club at Topeka, October 30, 1919, Judge Huggins expressed a preference for the Industrial Court over an arbitration board. He said that the majority of the board are committed beforehand to their respective partisan interests, and that the third or impartial arbitrator either has his mind made up as soon as he is chosen, or strives merely to effect a compromise between the conflicting claims of his fellow arbitrators. While this sometimes happens, it is scarcely ever necessary. If the Kansas legislature had been willing to enact an arbitration law instead of an industrial court law, it could have produced an institution which would have avoided most of the objections which are ordinarily brought against arbitration boards. In the first place, it could have provided machinery for mediation and conciliation which would have brought about the adjustment of the majority of industrial disputes through direct negotiations between employer and employe. The Kansas Industrial Court law contains no such provision.

In the second place, an arbitration law could have been made which would have put upon the board as the impartial element men who were as open-minded as any judge. In the third place, an arbitration board has one essential advantage over a court; for it contains members who represent both sides of the dispute and who are in an advantageous position to analyze and interpret the evidence. This is a better process for getting at the truth than that of mere cross examination. In other words, the impartial member of an arbitration board receives valuable assistance in understanding the facts from his fellow members. Fourth, there is always a possibility, and frequently a probability, that the partisan elements of the arbitration board will yield their extreme positions and contentions, so that the decision can be unanimous. Finally, even though the representatives of the two sides are unable to agree, and the case is decided practically by the impartial member alone, the process is not essentially different from that involved in the decision of an industrial court. What happens is that the impartial member acts as an adjudicator, a court, between the two contestants.

At its worst, therefore, a properly constructed arbitration board functions as well as an industrial court; in the great majority of cases, it is more effective than a court.

Property Sacred to Lawyers

AN INDUSTRIAL court is not necessarily impartial. The defenders of the Industrial Court idea lay great stress on the freedom from bias which is assumed to inhere in an Industrial Court. This assumption is, to say the least, very much overdrawn. The first reason for this statement is that the court is composed of lawyers. Now the average lawyer necessarily leans to the side of capital. "The legal training of the judge, from the time he starts out as a practicing lawyer, is such as to attract his attention to the sacredness of property, his mind is chiefly occupied with the means of upholding property rights," said Professor James T. Young, in "The American Government and its Work," p. 290.

It is not too much to say that the lawyer or the judge who overcomes this handicap is able to do so only because his nature is unusually sympathetic with the weak, or because his legal practice has been largely among laboring people, or because he has been an unusually earnest student of industrial questions. Indeed, the inability of the lawyer to take an adequate and impartial view of industrial relations seems to be disclosed in Section 17 of the Kansas Industrial Court law. Therein, we find it declared unlawful for any employe to conspire with other persons "to quit their employment, or to induce other persons to quit their employment *for the purpose of hindering, delaying, interfering with or suspending the operation of any of the industries, and so on.*" The italicized words add absolutely nothing to the preceding clause, inasmuch as every such "conspiracy," that is, every strike, is for the purpose of causing the suspension of industrial operations. A strike without such intent is inconceivable. Apparently the authors of this provision thought that they were neutralizing the interference with liberty contained in its first part by calling attention to the interference with property rights described in the second part. There seems to be a bias in favor of property rights as against the right of reasonably free action.

In the second place, the members of an industrial court will frequently reflect the economic theories and prejudices of the appointing executive. The judges appointed by Governor Miller of New York would have a very different attitude toward industrial problems and industrial justice than would those named by Governor Blaine of Wisconsin. In many cases, the court would be put down as having a distinct class bias. Whether that bias were in favor of capital or in favor of labor, would be immaterial as regards the handicap it would create to the effectiveness of the court.

The decrees of an industrial court are unforcible. It is frequently asserted that strikes have increased in Kansas since the Industrial Court was established. While this is probably an exaggeration, the fact remains that many, very many, strikes have taken place in spite of, some of them directly against, the Industrial Court law. Moreover, it is opposed by both parties to the industrial struggle. Its constitutionality has been attacked in the courts by organized labor and organized capital.

The men who made the Kansas Industrial Court law were right in one thing; that was their belief that the state should provide a way of preventing, as far as possible, great strikes. The American people will not and should not tolerate such disastrous performances until all effective means of averting them have been thoroughly tried. Now the most effective means seems to be legally established arbitration machinery, in accordance with the principle underlying the National War Labor Board and the Railroad Labor Board. However, the latter agency is radically defective because it has not been provided by Congress with an industrial code, or bill of industrial rights. If a fair arbitration board is established, and if it is required to make its findings in accordance with a body of law, that is, an industrial code, its decisions will, in the vast majority of cases, be enforced by public opinion. That is as much compulsion as can be brought to bear effectively upon the contestants in any industrial dispute. And it is practically sufficient. But no legal scheme of arbitration will be adequate or fair that does not contain a body of industrial principles.

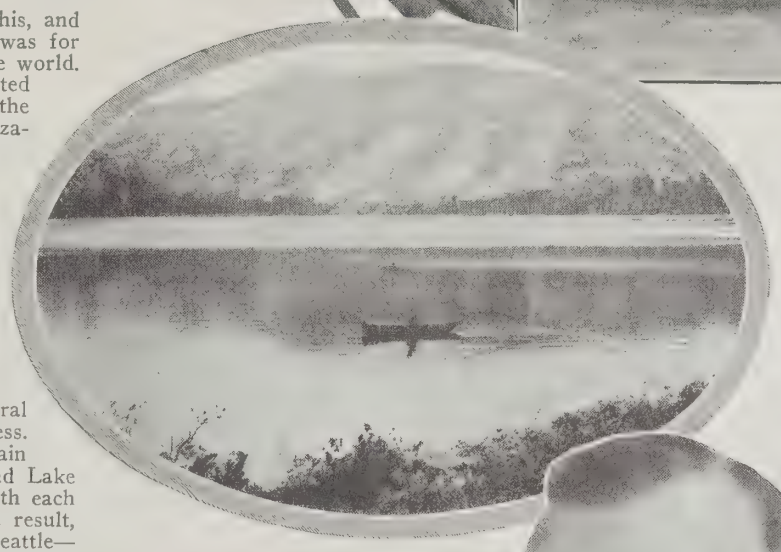
Senator Kenyon's Recommendations

THE importance of this element may be seen from a perusal of the code suggested by Senator Kenyon, in his recent Report on the West Virginia Coal Fields:

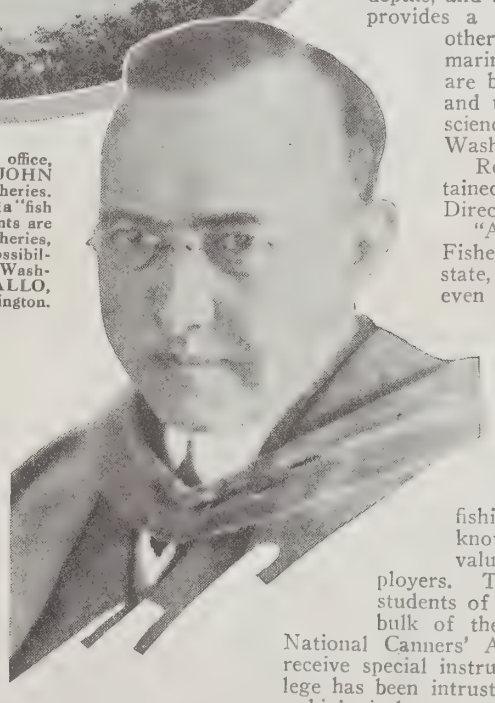
1. Coal is a public utility, and in its production and distribution the public interest is predominant.
2. Human standards should be the constraining influence in fixing the wages and working conditions of mine workers.
3. Capital prudently and honestly invested in the coal industry should have an adequate return sufficient to stimulate and accelerate the production of this essential commodity.
4. The right of operators and miners to organize is recognized and affirmed. This right shall not be denied, abridged, or interfered with in any manner whatsoever, nor shall coercive measures of any kind be used by employers or employes, or by their agents or representatives, to compel or to induce employers or employes to exercise or to refrain from exercising this right.
5. The right of operators and of miners to bargain collectively through representatives of their own choosing is recognized and affirmed.
6. The miners who are not members of a union have the right to work without being harassed by fellow workmen who may belong to unions. The men who belong to a union have the right to work without being harassed by operators who do not believe in unionism. The organizations have a right to go into non-union fields and by peaceable methods try to persuade men to join the unions, but they have no right to try to induce employes to violate contracts which they have entered into with their employers, and the operators on the other hand have the right by peaceable means to try and persuade men to refrain from joining the unions.
7. The right of all unskilled or common laborers to an adequate living wage sufficient to maintain the worker and his family in health and reasonable comfort, and to afford an opportunity for savings against unemployment, old age, and other contingencies is hereby declared and affirmed. Above this basic wage for unskilled workers, differentials in rates of pay for other mine workers shall be established for skill, experience, hazards of employment, and productive efficiency.

Women's Rights Recognized

8. The right of women to engage in industrial occupations is recognized and affirmed; their rates of pay shall be the same as those of male workers for the same or equivalent service performed; they shall be accorded all the rights and guaranties granted to male workers and the conditions of their employment shall surround them with every safeguard of their health and strength and guarantee them the full measure of protection which is the debt of society to mothers and to potential mothers. Few women are engaged in any way in mining, but it may be as well to announce this proposition as to pass it by.
9. Children under the age of 16 years shall not be employed in the industry unless permits have been issued under State authority.
10. Six days shall be the standard work week in the industry with one day's rest in seven. The standard workday shall not exceed eight hours a day.
11. Punitive overtime shall be paid for hours worked each day in excess of the standard workday.
12. When a dispute or controversy arises between operators and mine workers, there should be no strike, or lockout, pending a conference or a hearing and determination of the facts and principles involved.



College Teaches Fishermen of West How to Fish



Institution Does Much to Save Neglected Western Resources

Top to bottom—College of Fisheries, office, museum and library. PROFESSOR JOHN N. COBB, Director, College of Fisheries. Food preparation laboratory. Making a "fish survey" of a mountain lake. Students are now engaged in making a survey of fisheries, fish resources, commercial fisheries possibilities and fields for planting of fish in Washington. DOCTOR HENRY SUZZALLO, President of the University of Washington.

TO THE eye of the landsman, the business of fishing, though it brought to the world's fishermen more than half a billion dollars last year, is a rather fixed industry. That is to say, the fisherman—and this concerns the commercial fisheries only—drops his line or his seine or his trawl overboard, and takes what he gets when he hauls it in. This has been, and still is, largely true; the whims of the sea and the vagaries of the always wandering schools of fish largely controlling the prosperity or the lack of it of the commercial fishermen. Yet, within the past few years, it has come to be recognized that the fisheries may be regulated, the habits of the fish sought studied, and much of the uncertainty of the "harvest of the sea" converted into a reasonable sureness of output every year.

The Japanese were the first to understand this, and they established in their island kingdom what was for a long time the only college for fishermen in the world. Though the fisheries production of the United States alone is about one-fifth of that of all the world, we did not recognize the possible stabilization and development of this industry until about two years ago—on April 2, 1919, to be exact—when the university of the state of Washington, at Seattle, working with the United States Bureau of Fisheries, established a college, as one of its branches, for the instruction of fishermen, and those planning to enter the commercial fisheries industry of the world.

Enough time has elapsed to demonstrate the necessity or lack of necessity for such an educational institution, its popularity among the fishermen, or its lack of popularity, and its general results. It has been an unqualified success.

The College of Fisheries is located on the main campus, on the shores of Lake Washington and Lake Union, which bodies of water are connected with each other and with Puget Sound by canals. As a result, the largest deep-sea vessels which come to Seattle—the "home port" of the College of Fisheries—are enabled to tie up alongside the Lake Union dock of the university, only about 1,000 feet from the College of Fisheries. At Friday Harbor, on Puget Sound, the university owns one of the best-situated marine biological laboratories in the world. The matter of establishing this college was first taken up in 1914, but the breaking out of the World War caused a postponement of the plans until the spring of 1919, when the College of Fisheries opened its doors, with John N. Cobb as director. Mr. Cobb, who has been long and intimately connected with the commercial and economic fisheries of the United States, is still the director, and has had the good fortune to see the College of Fisheries grow to be one of the most important of the 14 schools and colleges within the University of Washington.

The College of Fisheries was established with a twofold purpose: First, to afford instruction in the principles and practices of fishery; and, second, to promote the interests of the fisheries of the state of Washington and of the United States by encouraging the right use of fishery resources. The four-year curricula of the college leads to the degree of bachelor of science in fisheries, and the degree of master of science in fisheries is conferred on any graduate of the four-year curricula who has completed at least one year of graduate work, and has presented a satisfactory thesis with the grade of A, B or C. Graduates from other institutions of equal rank will be given full graduate standing, but they must have knowledge of zoology, bacteriology, botany and chemistry.

Students in this college are taught the fundamentals of commercial fisheries, how to outfit for the fisheries, how to operate for each variety of food fish, and how to prepare the fish for market once they are caught. These branches are covered in a course known as "Fisheries Technology." They also are taught to conserve the fisheries resources of their own or any other state, by surveys of the available waters and their fish supply, by the proper planting of fish in these waters, and by the establishment of rules whereby this supply of fish can be conserved, not alone for the commercial fisheries, but for anglers as well, so that the "Fish Culture" course, as this is called, covers not only the coastal waters, but the mountain streams and lakes as well. The University of Washington also maintains, largely in connection with the College of Fisheries and with its other branches in the natural sciences, a biological station at Friday Harbor, on Puget Sound, where there are well-equipped zoological and botanical laboratories, on land donated by Andrew Mulhall for the purpose. Water from a depth of 100 fathoms to the shore line is available for the study of all the forms of marine life inhabiting the various depths, and the 12-foot rise and fall of the tide provides a beach clearance unrivaled at any other location for the study of the marine life of the shore. The students are boarded and lodged at this station, and the work is a regular part of the science courses of the University of Washington.

Regarding the practical results obtained from the College of Fisheries, Director Cobb says:

"As to the value of the College of Fisheries to the industry and to the state, I feel I am justified in saying that, even in its short existence, it has more than repaid the money expended on it. Research work along certain lines has been inaugurated, and in time we believe this work will develop conclusions of much practical value to the industry. An opportunity has been created by which those now engaged in the fishing industry may enlarge their knowledge, and thus enhance their value to themselves and to their employers. The older and more experienced students of the College of Fisheries form the bulk of the salmon inspection force of the National Canners' Association, for which work they receive special instruction at the college. To the college has been intrusted the important work of making a biological survey of the lakes and streams of the state of Washington, a most essential, but usually neglected, precaution, without which we can have only a hazy idea of our game and food fish resources, whether they are in a flourishing or in a declining condition, and what should be done to aid them, if the latter be the case, and, further, as an essential, but also usually neglected, preliminary to the intelligent and successful stocking of our streams. Special instruction is given to all who are considering engaging in the canning or packing of fish or any other branch of the fisheries industry, but who lack the special knowledge of the methods employed which is requisite to success in this day of specialization in business."

Aside from this College of Fisheries, the only one of its kind in the New World, the University of Washington is one of the most interesting, both historically and currently, of all the state universities which have grown to such size and influence during the past few years on the Pacific Slope. While the university was established in 1861, it was 1876 before a student was graduated with a bachelor of arts degree. The territory was young, and the majority of the people for a long time were more concerned with the location of their principal city, their territorial, and afterward state, capital, and their admission to the Union, than they were with preparations for the education of future generations. Continuous effort by a number of far-sighted men and women, however, resulted at last in the firm establishment of a state university, which, from its one graduate of 1876, has grown to present graduating classes of 400 to 500 every year.

Why College Teaches Fishing

By JOHN N. COBB,
Director of the School of Fisheries,
University of Washington.

THE principal justification for the establishment of the College of Fisheries of the University of Washington was the fact that the commercial fisheries of the North American continent are the most important in the world. In the United States, including Alaska, their production amounts to 2,250,000,000 pounds annually, valued, as they leave the fishermen's hands, at approximately $100,000,000. Canada is the second most important fishing country in the world, with products valued, in 1918, at $31,348,084, while those of Newfoundland amount to $25,547,334. The total value of the world's fisheries is computed at $558,772,512, and if the value of the fisheries of the United States, Canada and Newfoundland were combined, they would represent almost one-third of the total.

In the fisheries of the United States are utilized 8,721 vessels of 238,576 net tons, and 190,836 men, women and children are employed.

An idea of the extent of the United States fisheries on the Pacific may be gathered when it is stated that Washington, Alaska, Oregon, California and Hawaii produce annually approximately 1,665,000,000 pounds of raw fishery products. Seven-eighths of the world's pack of canned salmon is put up on the Pacific Coast.

Much of our fishery resources is either totally neglected, or little utilized, simply because of the lack of trained men. The college of fisheries supplies these men, and teaches them the best methods not only of operating the industry, but of preserving and conserving the natural product which forms the basis of that industry.

A New Chicago—of Beauty—on Michigan's Shore

By ROBERT H. MOULTON

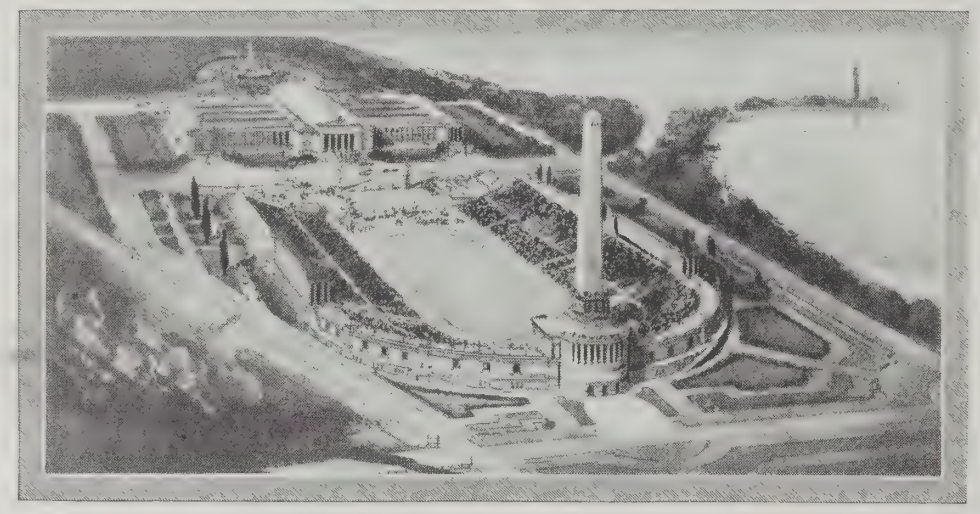
TAKE a last look at the somewhat dirty and disheveled old Lady of the Lake! Ten thousand beauty doctors in overalls are sinking their picks into her somewhat wrinkled and soot-spotted epidermis. She will shortly try electricity to clear up her bad complexion. Her circulation is all out of order and railroad and subway surgeons will presently open up new veins and arteries. About her throat is to be looped a necklace of living green. Physically she is to be made over. The ugly duckling of cities—Chicago—is beginning to sprout the plumage of a swan.

In no other city of the world are so many great public works under way and about to be started. Although the work of putting into effect the "Plan of Chicago" was started only seven years ago, the progress made, considering the volume of the whole project, is to be wondered at and applauded. Twenty-two separate and important features of the plan are now in the workshops of the city, county, state or nation. By the time the work is completed it is estimated that $250,000,000 will have been spent, only a part of which will come—by direct taxation at least—out of the public pocket.

The genesis of the new Chicago was written in the days following the close of the World's Fair in 1893. Conscious of the success of that tremendous undertaking, Chicago felt the desire to grow indefinitely in wealth and commerce and to hold her position among the great cities of the world. She wanted to enter upon an era of reconstruction—to experience a new renaissance. The experience of other cities had taught her that the way to true greatness and continued prosperity lay in making the city convenient and healthful for the ever-increasing number of its citizens; that civic beauty satisfies a craving of human nature so deep and so compelling that people will travel far to find it; that the orderly arrangement of fine buildings and monuments bring fame and wealth to the city; and that the cities which truly exercise dominion rule by reason of their appeal to the higher emotions of the human mind.

The result was that in 1896 there was conceived the Plan of Chicago—a scheme of civic improvement which had for its purpose the direction of the future growth of the city in an orderly, systematic way, and the solution of its problems of transportation, street congestion and public health.

It was realized that the American city, and Chicago in particular, is a center of industry and traffic, and therefore in working out the plan attention was given to the betterment of commercial facilities; to methods of transportation for persons and goods; to removing the obstacles which prevent or obstruct circulation, and to the increase of convenience. It was realized, also, that good workmanship requires a large degree of comfort on the part of the workers in their homes and surroundings, and ample opportunity for the rest and recreation without which all work becomes drudgery. Then, too, the city had a dignity to maintain; and good order is essential to material advancement. Consequently, the plans provided for impressive groupings of public buildings, and reciprocal relations among such groups.



For the great work of actual drafting of a practical plan for Chicago's growth, the city was given, without any charge, the services of the late Daniel H. Burnham, architect. The genius of this world-renowned man was contributed to Chicago's good, and that at a time when other great cities, busy at planning betterments, were bidding thousands of dollars for the services Chicago was getting for nothing.

One of the most dramatic features of the Plan of Chicago, what, indeed, might be called the heart of the entire plan, is that providing for the development of the lake front. The central idea on which this feature is based provides for a complete remodeling of the shore land from Jackson Park on the south to Wilmette on the north, a distance of 21 miles.

In the development of the water front park scheme there will be, beginning at Jackson Park, a yacht harbor three miles along shore and two miles across. This will result from the building of a half circle of little islands in the lake in a zone where the water is comparatively shallow. Then northward will sweep one large island park, or perhaps two islands, reaching the main harbor at Twelfth street, nearly five miles in length and half a mile wide. Between it and the mainland will run a lagoon, 1,400 feet wide. Both margins of this lagoon will be planted with trees and shrubs, so arranged as to leave openings of various sizes, thus providing vistas of the water and the life upon it, to be enjoyed by the people along the driveways or living in the homes that line the park stretches.

That the lagoon will be a powerful attraction toward open-air athletics, both in summer and winter, cannot be doubted. It will be protected from the waves of the open lake and sheltered from the wind by the park strips on one side and by the city on the other, thus providing a waterway, always calm and always safe, five miles long and nearly a thousand feet wide. Here, houseboats, launches, canoes, rowboats and small sailboats, as well as crafts for public use, such as are usual on the Thames, the Seine and the canals of Venice, can ply unrestricted. An additional feature will be the construction of restaurants and pleasure pavilions along the waterway.

The developments of this water front park scheme does not end here, however. It is proposed to build a new strip of land immediately east of that occupied by the Illinois Central railroad tracks and extending out into the water for a distance of about 300 feet, running the entire length from Jackson Park to connect with Grant Park at Twelfth street, paralleling the lagoon and outer parkway strip. This will give Chicago the most magnificent water front of any city in the world, and will afford the people an opportunity to enjoy the alluring pleasures that only water sports and waterway parks can provide.

Development planned for lake front of Chicago. The great stadium is a splendid feature of the plan.

All the park authorities of Chicago have worked steadily toward the ideas of the lake front plans in the Plan of Chicago. During 1915, for instance, more than 200 acres were added to Lincoln Park on the north. It was made by filling in the lake. This improvement embraces a yacht harbor, 2,600 feet long and 1,000 feet wide, a lagoon, picnic grounds, extensive playgrounds, bathing beaches and a golf course. This work cost only $1,875,000, but the land thus made is estimated to be worth $15,000,000.

The improvement of Chicago's water front is the most practical and feasible part of the Plan of Chicago, and can be accomplished at virtually no extra cost to the taxpayers by building at the rate of 125 acres of land a year, utilizing Chicago's waste material and filling to a maximum depth of 30 feet, with the mean average depth of 12 to 15 feet. At this rate 1,200 acres of park land can be acquired in 10 years, and the value of this land, according to experts of the Chicago Real Estate Board, would be $46,000,000. To this should be added $3,000,000 which would be poured into the city treasury by private contractors who would pay for the right of dumping their material on city land. Grant Park, on the water front, is an illustration of what can be accomplished along this line. This park contains more than 300 acres and was built up entirely of the city's waste in a few years. Its creation is of inestimable value.

At the southern extremity of Grant Park the recently completed Field Museum of Natural History, which was made possible by gifts aggregating $9,000,000 by the late Marshall Field, was the first step in the development of this space as an educational center. This museum is known throughout the world as an educational and scientific institution. The new museum building stands on made land at the foot of Twelfth street and facing Grant Park. It covers an area of 700 by 350 feet, or approximately two city blocks, with a floor area of 670,000 square feet, and is the largest marble building in the world.

One of the most spectacular features of the lake front improvement provides for the construction of a great central harbor faced by Grant Park, which is adjacent to the lake and extends along the entire business front of the city. This great basin will lie in the hollow of curving park land shores extending into the lake three-quarters of a mile and more than a mile in length. Two long sea walls, curving outward, with openings at the center and at either end, will permit easy passage of vessels and assure calm water always within the harbor. This scheme further provides for great piers and stations at the extremity of the northern coast of the harbor, for the use of the passenger carrying vessels of the lakes, and buildings for park purposes at the extremity of the southern coast of the harbor.

A stadium for both land and water events, of unrivaled size and great beauty, is a feature of the general scheme of reclaiming and beautifying the lake front. This stadium will have a seating capacity of more than 100,000, with a pit on land sufficiently large for the most elaborate athletic events, army tournaments, or other outdoor gatherings. Over the arena spectators will have an open view of the lake. This arrangement will permit the use of the stadium for naval displays, boat races and other water events. Long study of street conditions, and the movement of trade and commerce in Chicago, has shown that the greatest need of traffic is to be able to avoid the crowded central part of the city wherever possible. To make the movements of vehicles from one part of the city to another less difficult was the chief aim of the first work of street improvement.

There has been selected as the inner street circuit about the central business district the four streets which bear the heaviest traffic. They are Michigan avenue. Twelfth street, Canal street and Chicago avenue. The great Twelfth street improvement, the first work of the Chicago Plan Commission on which the city engaged, is completed from Ashland avenue to Michigan avenue, a distance of two miles. The transformation of the old 66-foot street into a magnificent 108-foot wide traffic-way is a splendid example of twentieth century city planning. The total cost of the improvement was $4,500,000.

The Michigan avenue improvement came next. This street is the base line of the city's traffic, and it is destined to carry the heaviest traffic of any city in the world. For years this thoroughfare has been the pride of Chicago and the admiration of all who visit the city. But its "splendid mile," 130 feet wide, extended until recently only from Twelfth street to Randolph street. There its spaciousness was lost in a 66-foot squalid gap. Its remaining three blocks to the north branch of the Chicago River was lined on both sides with ancient, squatty, and half-dilapidated buildings, ending in the Rush street bridge, which was about as homely a structure as the eye could see, being an old-fashioned, single-span drawbridge.

The Rush street bridge was one of the most crowded in the world up to the time it went out of commission in May, 1920. It carried, prior to that time, 16 per cent more traffic than London Bridge, long known as the most congested vehicular bridge in the world. The seven east and west streets immediately north and south of the Rush street bridge carried 38 per cent more traffic across Michigan avenue to and from the railway terminals on the lake front and the warehouse district on the west side than enters London at its seven principal points of entrance. By actual count, 14,754 vehicles, proceeding north and south on Michigan avenue, interfered with and were delayed by 22,441 vehicles going east and west in the district between Randolph and Ohio streets. The total number of vehicular interferences being 125,719. The delay occasioned by traffic regulations has amounted to an annual loss of $500,000 to various interests.

To relieve this congestion, as well as to extend Michigan avenue itself, and incidentally complete the chain of boulevards from Jackson Park on the south to Lincoln Park and Sheridan road on the north, the Plan of Chicago provided for widening the avenue to the maximum width of

A Scientist on "The Creation of Matter"

By ARVID REUTERDAHL
Dean of the Department of Engineering and Architecture,
The College of St. Thomas.

Dean Reuterdahl today needs little introduction to readers of The Dearborn Independent. His fearless expose of the chronology of the Einstein experiments, published by this paper when refused by other periodicals compelled to take stock of their business-office receipts, caused a tremendous furor in the scientific world.

THE conclusions of Leibnitz, that ours is the best possible of all worlds, assumes that the universe is the created work of a Supreme Being. The materialistic science of the present time scoffs at such notions as childish and immature. In the ranks of the average man we find many who not only deny the existence of a Supreme Being, but who also denounce our world as the worst of all possible worlds. When we listen to their enumeration of the faults, omissions, errors, and evils inherent in the very fabric of the cosmos, it is not unlikely that we may conclude that the architect of the universe is either an inexperienced bungler or a fiendishly malevolent creature. It would be interesting to ascertain some of the details of construction which these atheistically inclined critics propose to use in their own model of the universe.

When an architect or an engineer plans either a structure or a machine, the first consideration is purpose. It is the purpose that dictates all the features of that which is built or manufactured. Form, size, durability and cost; the determination of all these items depends upon purpose. The relationships between the parts and members of a device are traceable to purpose. Even the kind of material used in the construction is decided by the intent of the design.

The materialist makes his universe from a matter which he assumes as existing without either a beginning or an end. Matter, according to this view, is not something which has been created. All that can be said for it is that it is the real essence of the *was*, *is* and *will be* of things. Thus the materialist dispenses with the need of a creator for there is nothing that requires creating. Matter exists and all things are material. If matter is eternal, it is also indestructible. One must admit that casual inspection reveals the view as both convenient and reasonable.

What is the evidence upon which the view rests? The mere assertion by the materialist that matter has not been created, and that, therefore, there is no creator, is of exactly the same initial value as the opposite contention. Observational evidence is lacking in both cases. Evidently no human being could have been present at the time when matter was created if we assume that matter is not eternal. On the other hand, if matter is without a beginning it is clearly evident that any attempt to bring forth human observational testimony in support of merely the bald statement is ridiculously futile.

How the Materialist Reasons

THE materialist readily disposes of the human testimony idea, preferring the inferential testimony directly from nature. Consequently, he looks for his evidence in the world of things. In the laboratory he subjects matter to various ordeals without being able to annihilate the most minute measurable fragment. Matter is subjected to the action of enormous heat, it is treated with acids capable of dissolving the most rigid specimens, and mechanical means are employed to cause the actual destruction of a mere particle of matter; but all the attempts are unavailing. The smallest particle of matter stubbornly and persistently refuses to be annihilated.

The materialist, therefore, draws the conclusion that matter has always existed. He reasons as follows: if I cannot today destroy a mere fragment of matter by any method known to science, then matter could not have been destroyed yesterday by any of these methods. The extension of the same argument to the day before yesterday requires no effort. The materialist has, in this argument, hit upon a means whereby he can keep on journeying backward, as it were, against the stream of time. Always during this backward traverse his verdict will be the same: "I cannot destroy matter." He is prepared, after this reflection, to state that, since no means has ever existed which is capable of destroying matter, therefore, the total quantity of matter which now exists, also existed yesterday, and the day before, and so on, backward in time without end.

Can the materialist advance any other argument in support of his views? We venture to answer this question with a definite and emphatic, No! His entire case rests upon the validity of this single sample of reasoning. For the materialist, this is particularly unfortunate because this sample is entirely worthless as a proof.

The question is here pertinent; if the reasoning is fallacious, where is the error? We begin our search for the fallacy by asking another question: what did the materialist actually observe when he concluded that matter is indestructible and eternal? He must admit that all that he really observed was a series of changes or transformations. A solid may have been transformed to a liquid and then to a gas, or the change may have taken place in the reverse order; in either case, the outstanding fact was that no break or gap in the continuity of the change developed. If a real break in the transformation series had taken place, then the conclusion would have been that, at that stage of the change, matter ceased to exist. Since no rift or unbridged fissure was found, therefore, matter is without beginning and end.

We may still further limit the preceding question by asking: *did the materialist really observe matter at all?* A reply to this question will force the materialist to define what he means by matter. This definition is always given in terms of molecules, atoms, electrons and primordial particles. In this connection it is interesting to note that no sooner had the ink dried on the specifications for the modern atom before another competitor for scientific honors appeared. We refer to the electron which is much smaller than the atom. It would seem that we are about ready to greet a new member of the family of matter, a particle still smaller than the electron. Not for one moment do we give ourselves up to the vain thought that the end will ever come in our discovery of smaller and smaller particles this side of the last primordial, the ultimate action center. By that time the much cherished and highly respected nugget-like kernel which has given such great comfort to the materialists will have vanished completely. With the disappearance of this *reliable* and *tangible* kernel will come the complete collapse of materialism. The trial of this ultimate kernel has become more narrow and elusive with every new discovery in science.

In the exciting race to overtake matter, the materialist has been much like the man who tried to catch up with his own shadow by running away from the light; the faster the man ran the farther away was the end of his shadow. For the materialist the search for matter has developed into a veritable shell game in which the materialist always loses by holding an empty shell in his hand when the game is over. The elusive kernel has never come within the striking distance of the materialist. It is always just beyond, never actually the known; in his hand he finds the shell, never the kernel. Transformation and continuous change constitutes the fundamental feature of the phenomenal shell game that nature plays with the materialist. All he ever really observes is the various changes of an unknown, elusive, un-capturable essence which defies every attempt at apprehension and seizure. Even the shell dwindles in size as he passes along the converging series of molecule, atom, electron, and what next? on the way toward the apex of a veritable *reduction cone* where shell and kernel disappear together into the great ocean of reality from which all action emanates.

The contention of materialism that matter has always been present in the cosmos actually reduces to a totally different statement in which the subject is not *matter* but *change*. Thus the materialist must content himself with the statement that change is eternal and can never be brought to an end; and this would be the only type of indestructibility that he could claim with any show of reason and consistency. Both the materialist and the atheist must admit that *they cannot exert mandatory powers to determine the type and form of this change*. It will be difficult, indeed, for the materialist to contend that this series of changes and transformations does not include a transition from an unknown to a known type of existence. The meager knowledge (all of an inferential nature) that we have concerning the physical and chemical changes which were a part of the cosmic history in the eons before the advent of man, itself constitutes a warning against presumptious assertions concerning what may and may not have been. Who then will dare flatly to assert that the history of the universe does not include a transmutation of the essence of things (call this *matter, substance, energy*, or whatever you please) from a lower to a higher order. We have followed the *phantom matter* along the *reduction cone* and observed atom and electron dwindle and disappear through the vertex of the cone, shell and kernel vanishing simultaneously into the ocean of pure existence. If we journey in the opposite direction from the ocean of pure existence toward the apex of the *reduction cone* then we will behold the process of the *creation* of *matter*. The instant that we pass through the vertex of the cone we find ourselves in the world of continuous change and transformation. The essence of things clothes itself in the phenomenal shell of change. Pure existence becomes represented by many apparently independent and disparate action centers which combine into the various well-known types of matter groups.

Only Five Views to Entertain

FLOATING backward against the stream of time five and only five cosmic views can be entertained:

1. Matter has always existed in a condition of motion.
2. Matter has always existed but at one time it was in a condition of absolute rest.
3. Matter is ever present in the cosmos but it passes cyclically from a condition of absolute rest to motion, from chaos to cosmos, material universes being evolved only to devolve at the end of a cycle into inert matter.
4. Matter has *not* always existed but was created during some period of time.
5. Matter appears and disappears (created and annihilated) in cycles during which periods universes are born, mature, and pass away.

Only a brief investigation of the merits and demerits of these views is here possible.

1. In the first view matter is associated with energy because of the introduction of the idea of motion. Matter and energy have never been isolated; like the two sides of a coin they are inseparable. The supposition that matter has always been in motion comes into direct conflict with the fact that the *universe-machine* is actually running down. Energy is constantly being transformed from the available to the unavailable type. In every transformation a certain portion of the involved energy is degraded into the form of unavailable heat. Water flows from a higher to a lower level. It is the same with energy. Ultimately *all* the differences in level throughout the universe will be neutralized and equalized. Then all the cosmic waves and crests will have been reduced to the last and absolute level. The great cosmic night will then begin, for the end of the material universe has come, and darkness and death reign supreme on the finite side, the Space-Time side of the mysterious screen which separates this world of phenomena and change from that world from which all action and existence flows.

If we admit this evidence from observation as true, which we must, then it also follows that the world has had a beginning in time. This is equivalent to saying that there is a beginning to the motion of matter because our physical universe is reducible into the terms of motion. Some scientists, notably the great Swedish scientist Svante Arrhenius, have endeavored to avoid this conclusion by introducing a self-winding mechanism into the clock of the universe. According to Arrhenius the physical universe is a self-compensating machine in which radiation pressure compensates gravitation and the losses in the suns are equalized and offset by equivalent gains of potential heat energy in the nebulae. The self-winding universe of Arrhenius is merely another attempt at forcing the inclusion of the impossible into the universe; that is, perpetual motion. The universe throughout its entire fabric is so constituted that the full price must be paid for every transformation and change.

Conclusions That Are Invertible

WE CONCLUDE that the running down of the mechanism of the universe is incompatible with the idea of the eternal existence of matter in motion for the reason that an eternity is amply long to permit the complete running down of any machine. The world should, therefore, have come to an end long ago. Since it has not, we argue that it must have had a beginning in time.

2. The atheist and materialist can gain no particular comfort from the second cosmic view which is inexplicable without the assumption of the intervention of a Rational Will. Matter universally and absolutely at rest, will remain at rest unless acted upon by an Intelligent Principle external to itself. The condition of rest cannot be disturbed by one of the material particles unless we endow it with will and intelligence. No particle can lift itself, as it were, by its own boot straps. The essence of things (substance or matter) is always clad in the phenomenal shell of change. The two are inseparable in the world of Space-Time. Change, regarded from the physical standpoint, is a form of motion. When change and transformation disappear the essence of things also reverts to its prime source. Similarly when transformation begins, the essence of things begins to function. The ultimate principle in the physical world is action, meaning by this term something more than mere motion.

3. The third assumption is in part a composite of the first two and, in so far as that is true, is subject to the same criticism. Democritus, the Greek philosopher, held the view that the physical history of the world is the story of an unending succession of transformations from chaos to cosmos and vice versa. In regard to this conclusion of Democritus and an entire school of modern thinkers we merely ask; how can man, finite and limited, presume to make positive assertions concerning such a cosmic series of events known and comprehended only by the Infinite and Absolute Principle?

4. The previous discussion has served to eliminate the first three assumptions because they fail to include and harmonize a sufficient number of known facts in a consistent induction. We maintain that the world is rational and knowable within certain bounds. We hold that within definite limits, a true statement can be made concerning the origin of matter. The first two assumptions are, in their entirety, mutually incompatible. The third assumption is compatible with the second. The fourth and fifth assumptions are compatible with each other, but incompatible with the first three. Evidently the choice of the true, lies between two groups; the first, composed of the first three assumptions; and the second, consisting of the last two assumptions. We contend that the five assumptions presented above exhaust the possibilities; and of these we have shown the improbability and futility of the first three. The conclusion that the fourth assumption must be true is inevitable. The fifth assumption *may* be true because it is compatible with the fourth. No finite being can either positively affirm or deny the truth of the fifth assumption, for it is beyond the limits of finite knowledge. All that we can say is that only God knows.

We have arrived at a Theistic view of the cosmos. Every page of the great book of Nature is marked indelibly with the imprint and seal of Intelligence and Rational Will. Nowhere in the entire cosmos do we find an *independent* materialistic principle capable of accounting for the most elementary type of action. We can create an idea and execute it in the material which we find at hand in the universe. The creation of an idea is not a creation out of nothing. On the contrary, it is a fulfillment of a possibility previously existing in the totality of consciousness. In somewhat the same manner we may try to conceive the creation of matter as a direct consequence of a Divine plan projected into being by the Divine Will. He who seeks in the cosmic book will find order, purpose, goodness, beauty and truth; and he shall become convinced that no better world could have been created in which to launch a human soul on its way to perfection.

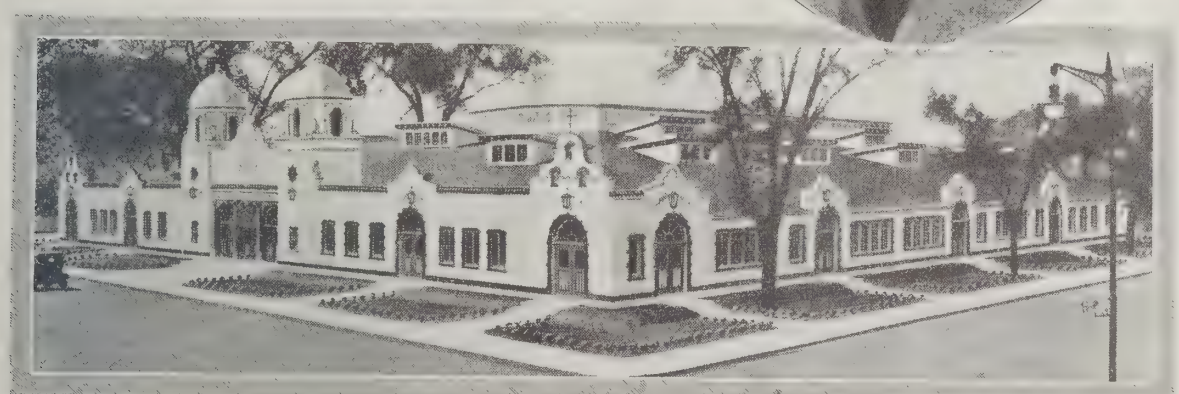
This Mother's Prayers Won

And E. Howard Cadle Does Not Forget

YESTERDAY a 30-year-old drunkard and gambler, "broke," given but six months to live. Today the prosperous owner of a chain of 16 shoe repair shops scattered about the country, with the prospect of an extension to 300 in a short time, wealthy, and the founder of one of the most beautiful memorials to a mother ever erected.

That in brief is the story of E. Howard Cadle, builder of the Cadle Tabernacle at Indianapolis, just completed. It cost approximately $375,000. A similar one is in process of erection in Louisville, Kentucky—all to the memory of a mother whose prayers, plus personal hustle and effort, have regenerated, made over and made prosperous a man who five short years ago was about down and out.

Cadle's story is that of a man who not only "came back," but a man who, thankful for what the dice of fate had won for him, has given to Indianapolis one of the finest tabernacles ever built in the country.



A bronze tablet which adorns the entrance of the new Indianapolis tabernacle epitomizes Mr. Cadle's turn in life. The tablet reads:

"Cadle Tabernacle—erected by E. Howard Cadle in honor of his mother, whose prayers saved him from a drunkard's and a gambler's grave."

Only five years ago Cadle, his wife and children were living in poverty in Orleans, Indiana. He was a porter in a saloon in that little town. Today he has a six-figure income, a fine home, servants, a luxurious town car, a walnut-finished, down-town office, the respect of the city and state, and, what he counts for most, a love of God in his heart.

Cadle, who was born at Salem, Indiana, 37 years ago, has told Indianapolis and Louisville audiences of his craze for gambling and drink. There seemed to have been nothing on which he would not place a wager. He said that he one time placed a bet on two raindrops running down a board, gambling on one drop to reach the bottom first. He went from bad to worse, until one day the doctor told him that he had but a few months to live.

E. HOWARD CADLE, of Indianapolis, and the Cadle Tabernacle, dedicated October 9.

Despondent, he tarried to hear Gipsy Smith preach. That night, with tears in his eyes, he went home to his prayerful mother, and on his knees promised her that he would live from that day forward a Christian life. It was not an easy task to regenerate himself and make good for his family's sake. It was not an inspiration to be forced to wield a mop on a janitor force at the Indiana state capitol, but Cadle wielded it until he graduated from that lowly job.

Finally, he got a job as an automobile salesman and in his zeal to make good, he sold a car a day for a year. With the results of his efforts he paid off his debts and invested $300 in a shoe repair business. Later on, as the company developed, he disagreed with the other members of the firm and it was a case of get out himself or buy them out. He went to James P. Goodrich, former governor of Indiana, under whose administration in the state house he was a wielder of the mop, and told him of his business affairs. He asked for $25,000 and Mr. Goodrich, impressed with the story, wrote out a check for that amount. Cadle became president of the company and Mr. Goodrich became vice-president.

Today Cadle's firm has a string of 16 shoe repair stores in nine cities of Illinois, Indiana and Ohio.

There is a large-framed picture of the olive-skinned English evangelist, hanging on the wall of Cadle's business office, and to that picture every day Cadle lifts eyes of gladness as he bows before the memory of the man who helped him. In Louisville, a year ago, Cadle bought a lot and erected a permanent tabernacle in which to carry on the evangelistic work begun by Gipsy Smith. A bronze tablet bears the same inscription that is placed on the Indianapolis tabernacle.

Commence, Don't Begin

THE editor of a magazine was asked recently to give some advice to a young writer, who had been brought to his attention by a friend. He thought a moment and then said tersely:

"Tell him: Don't begin, just Commence."

There is a world of wisdom in that short remark. A writer often begins his tale with an explanation, perhaps, of the theme, the people, the place in which the plot is laid or, as is often the case, he may moralize for a thousand or more words. Then when the reader is about ready to drop the magazine uninterested, the author really *commences* his story. "Get them in the first paragraph if you want to hold their attention" is applicable both in literature and in life.

Many a man has lost out because he only *began*, and did not *commence*. Perhaps he is a salesman who, when he enters the office of a prospective customer, tries to ingratiate himself into the other's favor before coming to the point. He speaks of the weather, talks of business conditions in general, and the outlook for the coming season. When at last he has made his beginning, and is ready to commence his sales argument, it falls flat. Another commences who when he enters an office says: "I am here to tell you of the new issue of municipal water bonds. They pay 7½ per cent interest. As the city is behind them they are as good as gold. Just sign on this dotted line—" Notice the difference?

The preacher, the lecturer, the public speaker of any kind, often bores his audience and gets it out of sympathy with him, just because he *begins* with a long introduction, taking perhaps twenty minutes before he *commences* what he has to say.

Many a woman has failed to accomplish what she set out to do, simply because she *began* and did not *commence*. She dallied, and fumbled, and *began* to do the thing in a half-hearted manner, promising herself that she would *commence* in earnest later on when she had more time. That hour never came and she never really commenced and, therefore, by all the rules of progress, could never attain her goal.

One of George Eliot's stories starts with the sentence: "Things never *began* with Mr. Borthrop Trumbull, they always *commenced*."

We begin life when we draw our first breath. We never really commence to live until we have attained our majority and can appreciate the beauties of life which throng the soul.

Whenever you have something that must be done, whether it is to preach a sermon, sell a bill of goods, or do a job in the shop, don't begin and experiment and waste your own time and your employer's. Think it over carefully and when you are ready, just *commence*.

"I began that letter a week ago," said a young man who had an important business communication to write, "and it isn't finished yet." Why? Because he *began* it, and didn't *commence*. Just try commencing things this week and see what will happen.

"Don't begin; just commence."

A New Chicago

Concluded from page 12

130 feet and to carry it on a straight line via a new bridge into the Lake Shore Drive north of the river. Both the avenue and the bridge, which have been completed about a year, have two levels. The upper one extends from building line to building line—the full width, 130 feet. New buildings abutting on either side have the unrivaled advantage of two streets—the lower one used for heavy traffic and the upper one the light traffic-way and main entrance thoroughfare to the store buildings. The approaches to the two-level section are very gradual slopes, and one scarcely realizes that he is passing from the city grade to an upper level.

Another important reason for the projection of Michigan avenue on the plan outlined is that this great natural highway extending, as it does, 40 miles from Jackson Park to Lake Forest, skirting a great inland unsalted sea, where, in rough weather, the spray dashes over the curb, presents possibilities for attractiveness and beauty such as do not exist in any other city. The world's great cities are all inland. No other city has an opportunity for a world-famous thoroughfare so beautifully situated as has Chicago.

The reclamation of South Water street, now forming probably the world's greatest produce and commission market, and on which the congestion is so dense that through traffic is absolutely blocked, is another improvement of magnitude, and one which is necessary to complete Chicago's great central district.

The removal of the South Water street market to some location outside the loop will reduce loop traffic 13,814 vehicle trips a day.

By development since 1911, the future of Canal street as a place of monumental architecture is assured. First, there came the fine $20,000,000 Northwestern Railway terminal. Then, more recently, the splendid Union Station, forming a part of the $60,000,000 development plans of the Pennsylvania and associated lines, work on which is proceeding. Between these two imposing terminals will be located the new West Side post office, which will be commensurate with Chicago's position as the central clearing point for the mail of the entire country.

To remodel Chicago, the world's fourth city, is no light task. It is a Titan's job. But for its accomplishment Chicago has a citizenship which has never shrunk from herculean efforts for the common weal. Chicago's people, awake and alive to their opportunities, are preparing for Chicago's destiny. The "I Will" spirit is at work among them. It is calling on a united citizenship to achieve for Chicago. And in no better way is that spirit manifesting its determined, unfaltering and triumphant character than in the hearty support and rapid execution of the Plan of Chicago. Chicago's destiny is in safe hands.

His Richest Fee

Concluded from page 8

life. How strangely we gauge pay for our services! *Never have I received such payment for my service, though I got not even a cent.*

"After all, life is a chivalrous field of adventure."

Contrary to the popular impression in this country, most of the people of Labrador are of Anglo-Saxon descent. A small number of Eskimos and Indians remain, but they are much in the minority. The fisheries constitute the main resource of the people, supplemented by the fur industry in winter. Steps have been taken to introduce other industries, but the fisheries still must carry the great load. Income from the fisheries has been greatly reduced by the general depression, however, and many fishermen are having great difficulty making ends meet. The main customers in the Mediterranean cannot pay the price the fishermen need to live.

Headquarters of the Grenfell mission are at St. Anthony on the northern point of Newfoundland. Northern Newfoundland is colder even than the Labrador coast, due to the ocean currents, and is in marked contrast to the rest of the island.

Five hospitals have been established along the Labrador and Newfoundland coast. With four nursing stations, these units now make a little chain of centers about 50 miles apart.

Two orphan homes have been built. Early in his work, Dr. Grenfell found that he had to care for the orphans. Summoned to a lonely headland fifty miles from one of his hospitals, he found a mother dead, and a father dying. He buried the two parents and thought he had done all that might be expected of a doctor. But there were five little tots. He took the children home with him. Soon the orphanages came into being.

Dr. Grenfell first became interested in the fisherfolk as a result of a sermon by Dwight L. Moody. The evangelist's address induced him to seek a field where he could be of the greatest service, and eventually that led to Labrador. Since that time, his work has attracted wide attention. King George himself, summoning the doctor for an audience, conferred special honors upon him. Doctor Grenfell is 57 years old, but still a young man, and he insists he isn't going to be laid on the shelf as long as Labrador is on the map.

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

Frogs are used as barometers in many European countries. The green tree frog is placed in tall glass bottles with little wooden ladders, to the top of which they climb in fine weather, descending at the approach of bad weather.

Paper pulp and strawboard are now made from oat hulls.

A German aeronautical experimenter, on a motorless soaring machine with hawk-like wings, rose from an absolute standstill to an altitude of 200 feet without assistance, and flew for 21 minutes and 37 seconds. He landed at a point only 40 feet lower than his starting point.

The First Methodist Church, of El Paso, will operate a large skating rink in the basement of the church to offset the dancing craze. It is to be a community proposition and no charge will be made.

Fifty per cent more money was spent by the people of the United States for perfumes, face powder and cosmetics in 1920, than the total endowment of all the private colleges and universities in the country, according to Treasury Department statistics.

The United States consumed 10,548,451,000 pounds of sugar in 1921. This represents 28.4 per cent of world production.

Although the increase in attendance since 1917, in 25 leading colleges in the United States, was 113 per cent, there has not been a corresponding increase in appropriations, equipment, endowment and teaching staff.

Forty-six Germans were killed and 109 wounded during every hour the World War was raging, according to German statistics.

The first daily newspaper in the United States to publish the Bible in serial form is the Topeka *State Journal*. The four gospels are to be published in weekly installments of approximately 3,000 words. The Weymouth text of the New Testament will be used throughout.

Mayor Oles, of Youngstown, Ohio, has donated his salary to the Community Corporation to be used in purchasing food for the needy. Each salary check has been turned over to the poor as soon as he could indorse it.

A revision of the compulsory labor law in Bulgaria provides that exemption from the labor law may be purchased by not more than 20 per cent of the subjects liable for service. The income derived from the sale of exemptions is retained by the municipal governments for the development of public works.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

The German National League of "Kinder Reichen" has petitioned the government for a fund to relieve large families. It advocates a special tax on bachelors and childless families in order to assist those who are keeping up the population. The League asserts heads of large families are taxed out of all proportion to the levy on childless families and bachelors.

It costs more than $10,000,000 a day to run the Government of the United States.

From the summit of a mountain in Glacier National Park, one can toss a pebble into waters which flow into Hudson Bay to the north, the Pacific Ocean to the west and the Gulf of Mexico to the south. The United States Geographical Board has christened the three small creeks originating at that point, Pacific, Atlantic and Hudson Bay creeks.

Nitric acid can be made by the oxidation of ammonia with the aid of ozonized air.

Hundreds of thousands of immigrants enter the city of New York through Ellis Island, from infected ports in which smallpox, typhus, cholera and plague may be epidemic or endemic, according to Dr. Royal S. Copeland, New York's health commissioner. Dr. A. Schlesinger, of the German Red Cross, says that hordes of Russian refugees are bringing cholera and typhus into Germany, Latvia, Poland and Esthonia, and many are seeking passports to America, where they have relatives and friends who finance the trip.

The calendar year 1921 eclipsed any preceding year in volume and value of building operations in China.

An English explorer claims to have discovered extensive, workable mineral deposits in the Antarctic. He also claims to have found the secret migrating places of whales.

Stenographers in the service of the United States Government lose $6,000,000 worth of the government's time each year rouging their cheeks and lips, according to efficiency experts of the Treasury Department. This is figured on a basis of 40,000 girls on the government payroll as stenographers and typists receiving $1,200 a year and upward.

Civil War veterans residing in Butler, Pennsylvania, who are more than 75 years of age, are exempt from payment of personal taxes for this year.

Baptist women in the farm districts of Iowa have agreed to contribute all the eggs laid by their hens on Sundays until the end of April to help finance foreign and home missions. It is believed that the contributions from this source will total more than $75,000.

"Trouble shooters" snowshoed 20 miles out on the telegraph right of way near Lamoille, Nevada, to remove the carcass of a jack rabbit, burned to a crisp, which lay across two short-tension wires, causing a short circuit and demoralizing electric service. A hawk was seen circling the spot and it is presumed the bird carried the rabbit to the wires for a meal only to be repulsed by the powerful current.

The Begum of Bhopal is the only woman ruler in Asia. She has reigned over Bhopal, India, for 20 years and is always veiled, in accordance with the precepts of Islam. Within her territories, she wields powers of life and death.

Forty-five per cent of the population in the United States inhabit 11 per cent of the area of the United States.

The founders' medal of the Royal Geographic Society has been awarded to Colonel Howard Bury, the leader of last year's Mt. Everest expedition. The medal is a token of appreciation for what the society considers the most notable geographic achievement in the last 12 months.

The trumpeter, who blew the "charge" when the "Light Brigade" rode up to the guns at Balaklava, recently died in Liverpool. He possessed 16 medals for valor and is believed to have been the last survivor of the "gallant six hundred."

Boston University is going to turn out head waiters and "bell hops" in a six weeks' course by the vocational department of the College of Business.

To relieve the housing shortage in Paris it is proposed to build a large fleet of houseboats and moor them along the Seine.

CURWOOD FINDS SOUL OF NATURE

Chronicler of the Neglected Truth

Viewing German Rhineland Under Many Flags

Coblenz Has Been Americanized by Wealthy Privates

GEN. HENRY T. ALLEN, Commander-in-chief of the American Army of Occupation.

By PAUL BOWERMAN

EVEN under winter clouds the Rhine was impressive. From Bingen to Coblenz the railroad skirts the shore, affording an unobstructed view of both banks. At the foot of the hills, rising sheer from the water, little villages clung to the precipitous slope, with the curious cone-shaped spires dominating the jumble of roofs. Ruined castles on the hilltops recalled legends of childhood. The glamour and romance was enhanced by actuality, as the train passed the Mouse Tower, where the mice swam the river to devour the unfortunate gentleman who had built a castle on an island in the Rhine. A little farther on, the massive cliffs of the Lorelei sprang into view, and the imperishable characters of the Wagnerian dream rose in memory—Wotan and Siegfried and Mime and Brünnehilde.

One of the most romantic spots in the world, beloved by poets and painters, the valley of the Rhine has attained a position above national prejudices. It belongs, in sentiment, to the world.

The train passed beneath the Castle of Stolzenfels, through the village of Capellen, and Coblenz appeared under the shadow of the Karthouse, while across the river, on the summit of a bare rocky hill, stood the fortress of Ehrenbreitstein with the American flag flying from the ramparts.

I had gone to Germany simply to see the Rhineland, to hear German opera, and to poke around bookshops and old churches. The station was alive with American uniforms. It was a noisy, good-natured crowd, not too careful of the proprieties of speech, but apparently oblivious of the fact.

As in the other centers of occupation, there is a billeting system in Coblenz, whereby civilians are assigned quarters, irrespective of their inclinations or pocketbooks. After traversing the whole length of the city, I was informed I would find a room in a hotel across from the station. Uniforms were everywhere. The soldiers seemed to outnumber the civilian population, two to one, and all were busy with the pleasure of having nothing to do.

It is almost impossible to consider Coblenz as a German city. Early one morning I enjoyed a brisk walk along the Rhine Promenade, a broad pleasant boulevard skirting the shore and affording a striking view of the massive, forbidding walls of Ehrenbreitstein. I stopped once to notice an inscription commemorative of the enthusiastic reception tendered the king and queen of Prussia, following the affair at Bad Ems that led to the Franco-Prussian War of 1870. Following the Promenade I reached the point where the Moselle joins the Rhine, sweeping around a triangular point of land. Here is the equestrian statue of Emperor William I, a gigantic figure of copper almost 50 feet in height, with a female figure representative of Genius placing the imperial crown upon the emperor's head. The whole is set off by a pedestal accessible by a circling flight of steps. Situated at the entrance to the city, and visible from afar, it is truly impressive. The sculptor has given the impression of herculean strength and virility. The horse on which the emperor sits seems ready at any time to breathe the fire of battle from his nostrils. The essence of militarism is incarnated there. It is huge, costly, and thoroughly Prussian.

Save for those two spots and a limited section of the Old Town, Coblenz bore a remarkable resemblance to a garrison town in America, its true status betrayed only by the names of the streets and the signs over the shop windows. Americans were everywhere. The Casino was now the Officers' Club, the Monopol Hotel the Hostess House, the Festhalle the Y. M. C. A. A number of handsome homes along the Promenade were occupied by the families of the American and Allied officers. Where the 50,000 native inhabitants kept themselves I could never discover.

The streets were swarming with army trucks loaded with supplies, and official cars of every description rolled through the sleepy little city, until I could believe myself at Plattsburg or Fortress Monroe.

The American soldier on the Rhine gets about six thousand marks a month, varying with the rate of exchange. On a fraction of that amount I lived very comfortably in one of the best hotels. The soldier, having sleeping quarters and food supplied by the government, has that amount to spend on his own amusement—or to satisfy his whims—dinners out of camp, excursions on leave, tailor-made uniforms. Never was a buck private so well off. A second lieutenant, on about 25,000 marks a month, has more money than he can spend reasonably.

Curious stories were told of the subterfuges used by the men to prevent return to America. Violent illnesses broke out in epidemics. A favorite resort was to quit camp A. W. O. L., returning after the transport had sailed to incur a punishment that appeared more desirable than the prospect of hunting a job in America. The argument was raised against the Army of Occupation that the troops were forced to remain in military service against their natural inclinations. No stranger delusion was ever entertained. Officers and men alike looked forward with no little misgiving to the day when they must abandon the security of army life. This was true despite the fact that the more intelligent realized that the longer they remained in service the more difficult would be the readjustment to another order of life. I had dinner one evening with a captain in the medical corps who had accepted a commission shortly after graduation from college. He confessed he had lost all ambition to take up a practice in civil life.

"I would have to begin at the bottom," he said, "and spend two years as an interne in some hospital. Then I would have to build up a practice. Here I have no future, to be sure, but I'm assured of a comfortable living."

The definite recall of the American troops, set for July 1, occasioned much regret.

In the Army of Occupation, the soldier had everything at his disposal—a stadium for the athletic contests which have been such an outstanding success, a Y. M. C. A. housed in one of the most beautiful buildings in the city and equipped with a theater, swimming pool, bowling alleys, and reading room, a daily newspaper, the Hostess House, a magnificent situation on the Rhine, and 6,000 marks a month to spend on himself.

On the way to Cologne I stopped off for a day in Bonn, an old city renowned as the birthplace of Beethoven and as the seat of a university. My troubles began within five minutes. I went to four hotels in quick succession and was told in each instance there was no room available, although I was convinced of the contrary. I made a fifth attempt in a modest little hostelry on a side street, where the proprietor hesitated for a full half minute before answering my inquiry, finally naming a price more than double what I had paid in Coblenz. I asked in a polite tone if there was a more reasonable accommodation. Without looking up from his writing, the proprietor shrugged his shoulders and said nothing. Were it not for the fact that I wanted to see the Beethoven Museum I should then and there have relegated Bonn to the list of undesirable cities, and continued to Cologne.

There was only a sprinkling of French and Belgian troops in the streets, allowing the German atmosphere to appear in stronger relief than in Coblenz. And much as this interested me, it became hourly more uncomfortable. On every side I confronted a battery of unpleasant glances and half-audible mutterings. Whether I stopped to look at a shop window, or wandered about the interesting streets of the Old Town, or sat down in a restaurant, there was always that unvarying stare on faces dimly aglow with stolid uncompromising animosity. I effaced myself as much as possible, observed punctiliously every formula of Continental courtesy, and even these efforts I felt sure were misconstrued, which served only to make matters worse. Wandering about the darkened streets at night in search of a haven, I came upon a cinema. It is an evidence of sheer desperation that I succumbed to the temptation to go in. Inside the stuffy little theater I chanced upon one of the most interesting side lights of my trip.

The film was a romantic melodramatic affair, with the scene laid in America whither the hero went in search of stolen gems. In the scenes depicting American life, Negroes and whites were shown mingling in social equality, dining in one another's homes, and in one instance a colored prize fighter became engaged to the daughter of a college professor. Opium dens were common in New York, with drug fiends staggering up and down Broadway. It took me some moments to realize that the film was neither a farce nor a burlesque, but was, on the contrary, ostensibly a picture of contemporary America. It seemed impossible that propaganda so crudely presented could find credence with a people supposedly intelligent. Yet the audience gasped with horror when the prize fighter embraced his fiancée with the paternal blessing of the elderly geologian.

The next morning I was at the station a full half hour early, waiting impatiently for the Cologne express.

After the provincial atmosphere of Coblenz and the pallid gloom of Bonn, it was good to be in a city again. Even the rain did not dampen the spirits. Limousines and taxicabs, passing in a double row of shining headlights, the strains of music through the open doors of restaurants and coffeehouses, after-theater crowds descending upon night clubs and cabarets, shop windows alluring with the choicest products of skillful brains and nimble fingers—all of the life and animation of a great city were to be found in Cologne. I was dazzled by the contrast.

Although as numerous as the American contingent in Coblenz, the British troops were swallowed up by the size of the city, and I came across them only at intervals. I gave myself up to the pleasure of poking about unnoticed through a wealth of interesting places—museums, churches, quaint old buildings dating from the days of the Hanseatic League, the Rathaus, the Gürzenich, bookstores and picture shops that were a delight to a lover of such things.

The opera was crowded every evening with fashionably dressed people. An excellent opera it was, well-conducted, well-sung, and remarkably well-staged. I decided that Wagner should be played only by a German orchestra, for the interpretation of Siegfried and The Flying Dutchman was a revelation to me.

In the manufacturing suburbs of the city every industry seemed to be producing at full capacity, to judge from the belching smokestacks and the crowds of prosperous-looking workmen coming and going. During the day the streets hummed with traffic, the sidewalks were jammed with hurrying people, the stores were full of

"Scraps of Paper" That Litter Wall Street

Financiers Alter Forms and Values of Securities in Astonishing Way

By CHARLES ALBERT COLLMAN

AN INTERESTING character faded away from Wall Street several months ago. He is known as the "Knacker." I inquired about him the other day. I found that because the brokers on the Stock Exchange have been marking up the prices of securities at such an alarming rate in the "million and a half share days" of the gambling craze that is now in progress, the Knacker despaired of doing any business for the present, and has temporarily retired to his New Jersey estate.

In London, when a horse drops dead in the street, they send for the knacker. This functionary skins the hide and sells it to a tanner. He sells the bones to the soapmaker, the hoofs to a glue factory, and the flesh to the cats'-meat-man.

In the financial district, the Knacker fulfills a somewhat similarly useful purpose. Whenever a corporation fails, a broker is closed out, or a receiver is winding up the affairs of a bankrupt institution, they send for the Knacker, who is prepared at a moment's notice to make a bid on things that are apparently valueless, such as an issue of obsolete bonds, stock certificates that have been stricken from the exchange list, or a bundle of defaulted notes. This man for years has made a specialty of collecting the "cats and dogs" of Wall Street, on the calculation that in the future some of them may be worth real money again. And it happens that obsolete issues at times prove of value, and in certain instances they may be needed urgently to legalize the affairs of a reorganized corporation. The Knacker in question has made quite a good thing out of his specialty.

The "Cat and Dog" Specialists

THE Knacker's chief competitor, a "cat and dog" broker, died a year or so ago, a multimillionaire. It was said in the Street that he had accumulated four barrels filled with such obsolete securities. At an advanced age he had married a handsome young woman, who later divorced him and obtained a large portion of his fortune—and she probably deserved the money.

It is an astonishing fact how Wall Street can alter the forms and values of its securities. Sometimes this action is taken for the purpose of concealing inordinate corporate earnings, but more often it is done to delude investors, or to facilitate speculations in stocks by presenting them in a more attractive guise, and making them more facile for gambling purposes.

In fact, as Wall Street grows older, it is becoming more and more the habitat of strange specialistic characters, such as Samuel Warren once depicted as inhabiting the law districts of old London. In musty offices one may find men today who make a living and sometimes great reputations by discovering "pay dirt" in the certificates of stock and bond issues long since abandoned as worthless.

One of these bond experts some years ago, lighted upon an enormous equity by discovering a "joker" in the mortgage agreement of a railroad bond which for years had been listed in the official book on obsolete securities as practically worthless. This discovery and its subsequent developments represent the most romantic record in the history of American railway bonds. It outrivals the famous case of Jarndyce vs. Jarndyce, because it ended more happily.

An old railroad equipment bond, repudiated and defaulted, which sold at nine cents on the dollar before it was thrown out of the New York Stock Exchange, was discovered by one of these old Wall Street bond students to be a second mortgage on the railroad line. For years this fact had been ignored or unsuspected. These bonds had been hoarded in the attic trunks of old men in Middle West country towns, and nearly half a century later, when the original owners were dead and gone, their heirs collected from a great railroad system $6,000 for every bond certificate which had sold for $90 apiece in Wall Street. Such things really happen—but they happen rarely.

A Story of the Panic of 1907

ONE of the most remarkable instances, illustrating the power of financiers to achieve great ends merely by juggling paper securities, occurred during the Rich Men's Panic of 1907. A man who later became the son-in-law of a President of the United States, had achieved his life's ambition by the construction of a railway enterprise, an underground line which, by penetrating the bed of a broad river, established a physical connection between two states for their passenger traffic. On the site of the terminal of this railway in New York City, he built two huge office buildings. A bond issue of many millions had been sold to pay the cost of these enormous twin structures, which were located not far from the financial district.

Great difficulty was experienced in filling these two buildings with tenants. The skyscrapers of Wall Street cannot pay their expenses by letting their offices merely to lawyers, brokers or security dealers. It is necessary for them to have more permanent tenants, such as large corporations, which contract for the occupancy of many floors over a long period of years.

Now came along the Rich Men's Panic, caused by a tremendous overissue of bonds and stocks and the collapse of their inflated values. It was a time of fearful strain, which those who passed through it will remember to the end of their lives. I shall never forget the day when, walking up Broad street, I was accosted by the chairman of a great western railroad. The eyes in his pallid face seemed to be gazing into vacancy. He grabbed me by the arm and, with twitching lips, demanded: "Have you heard about a bond house in trouble?"

I told my inquirer the latest news of the day. A very large bond house at that very moment was rocking so violently on its foundations, that, figuratively speaking, the crackling of its impending collapse was resounding throughout the financial district. A quiver passed through the body of the railway chairman. But he instantly pulled himself together and hurried past me toward Wall Street. A large part of his personal fortune was involved in the integrity of the banking house in question.

This bond house had bought the heavy issue of securities whose proceeds had gone toward the construction of the two office buildings. The buildings were more than half empty. The interest on the bonds was falling due. The bond house had hypothecated the securities in Wall Street banks to raise the money to be paid to the construction companies. Now the nonpayment of its loans meant ruin to it and kindred institutions and the collapse of a score of commission houses.

On this day the greatest banker in Wall Street stepped into the situation, and saved it. He controlled the largest industrial corporation in the United States, whose bonds were everywhere regarded as gilt-edged. This banker relieved the distressed bond house. He sent to the banks which held its loans, and substituted for the office building bonds, some millions of his industrial bonds. It was merely a switching of better collateral to brace up the bank loans, which were on the eve of being called. It was an exchange of certain pieces of paper for other pieces of paper. But that one act of his averted innumerable failures, and thenceforward this banker was known as the "Man who saved Wall Street."

However, the man who saved Wall Street had no intention of going into his own pocket to pay up the losses which the situation had created, and the reader can probably guess quite readily who footed the bill in the end. The action which this banker took illustrates the immense power which can be wielded by a single man in Wall Street who stands in control of a group of great industrial and railway corporations, and the use that men of his type make of their power, in total disregard of the interests of the men and women who have invested in such properties.

Takes His Profit Afterward

THIS banker happened also to control a railroad, which possesses a greater density of traffic than any other railroad line in the country. Although it is a mighty transportation line, it is very poor because of the dishonest ways in which it was financed in past generations. It may be stated, in justice to the present owners, that they are not responsible for those past transactions. This road has a capable and economical president. It happened just at this time that his company was in need of new executive headquarters to house the hundreds of employes, girls and young clerks, who kept records of train movements and traffic statistics. The president had drawn up plans for the building of a frame or cement structure, on economical lines across the river in Jersey City, to house his large force of employes and save money for his road.

The banker who had saved Wall Street, however, felt that he was entitled to make a profit on the building bonds which he had exchanged for his industrial bonds. He threw the plans of his railroad president into the waste-paper basket, and instructed him to contract for seven floors in one of the half-empty twin buildings, and there to house his vast office force. The president was compelled to obey, because the partners of his banker boss dominated the directorate of his railroad. To his chagrin, the economies he had planned for his impoverished railway were evaporated into thin air, and he saw his company forced to pay Broadway rentals for an immense amount of office space, which might better have occupied non-expensive quarters in a New Jersey manufacturing town.

This occurred in the year 1907, and from that date to this the stock and bondholders of the railway company have been helping to pay the interest on the bonds that built the terminal buildings. *It is they who made up the old panic losses, and saved the bond house and the situation in Wall Street. The joke is on them, not alone because they know nothing about it, but because the profits of their company are being diverted to another source, while the railway is still too poor to pay them dividends on its stock and legitimate interest charges on many of its bond issues.*

It is a peculiar fact that the bond dealer has a positive hatred for stocks. He feels a deep distrust toward a stock certificate, and rarely buys one. Between bondholders and stockholders there is a chasm that cannot be bridged. This is because the bondholder is a creditor of the company, and the stockholder is a partner in the business.

It is a matter for serious consideration that millions of shares of stock that pass from hand to hand daily in Wall Street are not owned by anybody. We will say that a corporation has listed $100,000,000 in its shares on the Stock Exchange. The chief interests in the company own only a small proportion of this amount. Another limited proportion is in the hands of actual investors. But probably $50,000,000 worth of these shares are merely registered in the names of brokerage concerns for the accommodation of speculators. This immense amount of stock passes daily from one commission house to another in the ordinary course of trading, or huge batches of it are lying in banks as collateral for call loans. It has no owners. It is said of such corporations that their control "is in the Street."

Stocks of the above nature are dangerous to buy. They are the pawns of pool manipulators. Brokers make their livelihood out of the sales of such issues, and gambling in them is their favorite sport. The person who invests in such securities has more money than sense, and will not have his money long.

Year after year new devices are invented in Wall Street to make stocks appear more tempting to investors and more attractive to speculative cliques. This is done by changing the par value. The traditional share of stock has a par value of $100. But there are now innumerable stock issues of the more popular type with absolutely no par value, or whose face value is $5, or $10, or $25. Thousands of men and women who trade in stocks—and women traders are becoming nearly as numerous as men—are totally unaware of or indifferent to the face value of such securities. They do not realize how they are being deluded. The point may be illustrated by a few examples.

When Stock Dividends Are Issued

ONE of the stocks most popular in the Street with speculators is an industrial issue. The company is a strong one, sound and capably managed, but its common shares are the mere plaything of Wall Street. In the year 1919, this company's common stock, which then had a par value of $100, sold as high as $406.50 a share. In the following year, for reasons which will be explained later, this company issued $20,000,000 in new stock in exchange for the old stock of $100 par value, on the basis of 10 new shares for each old share held. The new shares, of no par value, are thus really rated on a basis of $10 a share. This was done because it is difficult to market, sell or manipulate a stock selling as high as $400 a share. The new stock promptly dropped to $42 a share in 1920, and, at present, with its dividend passed, it is selling for $12. These shares are now represented in the "floating supply" in the financial district.

There are two important reasons why this low-priced stock is welcome in Wall Street.

First: It is attractive to the pool operator. It requires a bank roll only one-tenth as large, to work up a $10 a share stock, as it does to manipulate a $100 share stock. And as a rule the pools shun stocks selling higher than $100, because they cannot unload them at all.

Second: The average trader dislikes to buy shares selling at more than $100. He says to himself: "I can't afford to buy high-priced stocks."

Whereupon, this is what happens: A group of pool operators have run the $10 stock up to $15. Brokers, issuing advice to their customers, write, *"There is a good profit in buying the low-priced rails and industrials."* The margin trader, lured into Wall Street's doings, runs his finger down the stock list, and seeing one selling at $15, he says: "This one looks good to me." He buys the supposedly cheap stock, anticipating that it may be run up 10 to 20 points. Then the pool sells out, and the shares drop to $7 or $8. And the deluded speculator cannot figure out the reason why.

Now this speculator would have laughed at the mere idea of paying $150 a share for a stock that was paying no dividends. Yet that was exactly what he did. He bought a stock for $15 at a parity rate of $150. He was neatly tricked.

Another popular stock on the Exchange is one of the oil shares. The company is the owner of splendidly paying properties, but its shares belong to the category of "trick stocks." Their face value is $25, and they are selling at the present moment for $48. Men and women investors grab for these shares as great bargains on learning that the company is paying 12 per cent dividends. But in this instance, 12 per cent means only $3 a share. Many of these small investors would swoon at the mere suggestion of paying $192 for a share of stock. They would protest that they couldn't afford it. Yet this is exactly what they are doing.

War Profiteering Unparalleled

SOME companies suffer from an embarrassment of riches when their stocks climb up to unheard-of figures. Because of the nature of their business, they fear criticism or investigation, and they promptly issue a new flood of securities in the form of stock dividends, so as to make their profits seem less. This step was forced upon a large Wall Street corporation, which probably represents the most monumental example of war profiteering ever witnessed in the history of the world.

In January, 1914, the common stock of this corporation was selling at $30 a share, on the New York Stock Exchange. The World War approached, and the United States Senate passed a bill to construct a plant, at a cost of $11,000,000, for the manufacture of certain material which the Wall Street corporation was also engaged in making.

The Wall Street concern promptly engaged upon the greatest publicity campaign ever engineered by a single corporate management. It established an advertising and publicity staff, headed by the highest-priced publicity agent in the country. It spent its resources like water in *"An Appeal to the American People to Save Them $11,000,000 of Their Money,"* in an endeavor to defeat the proposal of the United States Sen-

Press Agents and Presidents

CAPITALIZING the presidency of the United States was not dreamed of when the makers of the Constitution created that post of supreme honor and importance.

This is a democratic country, but that does not imply that the chief executiveship is other than a place of the highest dignity. The people of the United States demonstrate no lack of faith in the principles of freedom and equality when they maintain most formal respect for the President.

Yet, with a degree of acceleration that has been painfully rapid, there has been a tendency of late years to use the President and others high in official life for private gain. The growth of photography in press-agenting enterprises has been the chief contributing cause of this condition. Of recent years the newspaper-reading public has been regaled more and more with pictures. Newspapers, eager for circulation, have exploited the picture interest to the utmost and public officials, always willing to get a little free publicity, have been educated to appear in various poses for the benefit of press photographs. As a natural sequence, the ever-present tribe of press agents adopted the picture.

The radio craze is the latest to strike the American public. The development of the wireless telephone will be of immense value to the world, but for the moment the controlling factors are two: the high enthusiasm of the amateur experimenter in something new, and the cold, professional exploitation of that enthusiasm by commercial interests.

President Harding, with a bored smile on his face, has been photographed with a radio set over his head. Secretary of State Hughes and others in the cabinet and in high official life have been similarly photographed.

Stripped of all veneer, the broadcasting of these pictures is merely the press-agenting of radio wares. A radio set adds nothing to the President of the United States, nor to the dignity of the man who is charged with handling diplomatic relations with other great governments. The country is entitled to see its officials purely as officials, and not in the circus garb that affords pleasure or profit to the Toms and the Dicks and Harrys who want the pill of their publicity sugar-coated with a great presence.

Sabatino Demasi Is Free

ONE sunshiny day back in 1909, Sabatino Demasi stood at a pier in Jersey City, his face aglow with smiles. He was waiting for the boat which was bringing his wife from Italy to enjoy with him the blessings and justice and joys of this free land.

The other day Sabatino stepped forth again into the free sunlight of America. He had not met his wife on that morning years ago. Instead, an innocent man, he has spent 12 years in a Pennsylvania penitentiary. Twice he heard the stern voice of a judge condemn him to death for a murder he did not commit. His wife, shocked into desertion by the charge against him, disappeared, God knows where. His mother died of a broken heart.

He is the victim of cruel injustice of two American institutions which we fondly believe are established to insure safety to all—the American police system and the American jury system.

There had been a holdup in a Philadelphia saloon. Two men had been slain by a masked bandit. The hue and cry had been strong. The public had demanded the slayer's blood; the police had wanted a man whose arrest and conviction would testify to their efficiency.

A man named Comporto was arrested, but the third degree had failed to break down his denial of the crime. In the meantime, Demasi, unable to collect a debt from an acquaintance, had taken some of the latter's clothing in payment, and departed. Philadelphia police caused him to be arrested in Jersey City and brought back. They sought to fasten the saloon holdup and killing on him. He stoutly denied it.

Then the police put before Comporto a purported confession of Demasi in which the latter was apparently placing the blame for the crime on the former. Comporto, enraged at Demasi and frantic with fear for himself, told a story which satisfied the police heart of hearts. It was that Demasi had committed the killings, and that Comporto had served as a lookout. It also charged Demasi with several killings in Towanda, Pennsylvania, some time before.

Demasi was tried. Bystanders who saw the holdup testified that the bandit's hair had been red. Demasi's was black. Four of Demasi's friends testified to an alibi for him. Demasi was defended by a young attorney, one of the type courts are prone to appoint to "protect the interests" of persons too poor to hire lawyers. The jury did not believe Demasi's story, nor his alibi. He was convicted, and on a new trial convicted again. Sentence of death was imposed.

The police were satisfied. They had "cleaned up" the saloon holdup and the Towanda slayings. After the crime reports, on the police registers, were placed the notations which went to establish the police record for solving crime and bringing to justice the criminals.

Somehow it was proved that Demasi had been in Italy when the Towanda crimes occurred, so the governor commuted his sentence to life imprisonment. Twelve years wore on. Comporto threw up his hands and confessed that he had lied, that he had manufactured the story out of whole cloth, that he had tried to fasten the crime on Demasi because Demasi had tried to fasten it on him.

The original "confession," purporting to be that of Demasi, was, of course, false. It was simply one of the third degree methods used by the police to arouse Comporto's vengefulness and force from him the confession they wanted, one which would fasten the crime on somebody, anybody.

The Demasi tragedy is perhaps an extreme one. Let us hope so. But the fact remains, well known to those familiar with the police system in large cities, that the police search for a scapegoat is all too frequent. Finding a man they deem "bad," many detectives reason that it would be a good thing to "put him away," and all too easily some of them succumb to the belief that it makes little difference whether he may actually have been guilty of the particular crime for which they seek a victim.

The law and order sentiment of the people of this country is vast. But it should not be so all-embracing as to accept without scrutiny the justice of all things done in the name of justice. Courts and jurors owe to themselves and the country the duty of scanning with closest care those cases which depend on police testimony. Too often, the most beautifully framed case is "the most beautifully framed case."

Unfair Comparison

"ONE thing the farmer gains is most of the food necessary to sustain life. Many a farmer gets from his farm and his own efforts food that costs the city family from $300 a year up."

This is true, and the writer quoted is not attempting an invidious comparison. His mistake is in the attempt to class the farmer as a wage earner, when he is an employer. The farm hand may well be placed in a class with the mechanic, but the farmer himself should be placed with the employer to make a fair test of his income.

First of all he has his investment, the interest on which would make a large hole in his income. The risk in crop success, even when agriculture is well repaid, is a matter that requires consideration. His own work must be figured at going wages as a business proposition, if not as high as a managerial position in a business involving the same capitalization.

He has the advantage of being his own employer, and that is all. It is worth while, however, and in the end the farmer is the happiest of the various business classes. But the attempt to show him his returns are adequate, or in keeping with those in other lines with which a just comparison may be made, is a dismal failure.

They Were Oversubscribed

AN ISSUE of $160,000,000 in Treasury Certificates at three and one-half per cent, offered by government as a temporary loan for six months, was oversubscribed in April. Such operations are of comparatively frequent occurrence. The wonder expressed in official circles that the certificates should not go begging, is followed by an expression of hope that in refunding the present debt, the rate of three or, at the most, four per cent may float any needed loan.

Most significant in this transaction is the fact that not a dollar of this issue will reach the general public. It was apportioned to the 12 District Reserve Banks, and each of the 12 was ready to take the certificates in excess of the quota assigned them.

The refunding of the existing debt, or any part, at a rate of four, or even three, per cent would be inexcusable. Government 2's, having the circulation privilege, are held at a three and one-half per cent premium today, while circulation taxes reduce interest rate one-half of one per cent. Even under the present system of borrowing from the banks the money furnished them by the government, no higher interest should be paid.

But why pay interest at all? Treasury notes instead of bonds, given the legal tender quality, would be secured by the same means the bonds or certificates are secured, and would function as money, a medium of exchange, without the expense and waste of a bond issue. When the Civil War debt was refunded this lesson was learned. Present-day statesmen should profit by the experience.

Leaderless Do-Nothings

A FEW years ago the country revolted over the rule of bosses in the United States Senate and the House of Representatives. Cannonism in the Lower House and Aldrichism in the Upper House brought forth the political anger of the nation.

Now, the Congressional pendulum has reached the other extreme. From the day when each body included a dozen or more outstanding figures our government has swung to the point where neither Senate nor House is able to offer a single example of real leadership.

There are independent men, and industrious men. There are learned and experienced legislators. There are men representing all viewpoints on the country's problems. But of statesmen able to combine enough qualities to get thought transmuted into action there is an utter void.

The sins of bossism were the sins of commission. The sins of the leaderless flock of Congressmen we now possess are sins of omission. Bossism at least had the virtue of doing something, whether that something was right or wrong. Congress, now at its lowest ebb since the Union was formed, does practically nothing. A bossed Congress earned its pay but the country could well save the $7,500 salaries of the five hundred members of the two houses.

Impudent, But Invited

FRENCH imperialism has been riding for a fall since the imposition of the conquerors' terms upon the defeated nations in the World War.

The revulsion of American public sentiment to the successive attempts of various European powers to accomplish their selfish aims has been general. But France's decline in American estimation has been relatively greatest, due to the high point of sentimental affection for Lafayette's country which we touched in the early days of the war.

The United States has adopted the rôle of an observer in the gallery while the rest of the world plays its politics. Traditionally, this country is opposed to alliances and from the American standpoint it is probable that the new treaty between Germany and the Russian Soviet Government would not draw approval. But viewed purely from the position in the gallery, it is difficult to refrain from a good healthy national chuckle over the way France received the news. France was surprised and indignant over this breach of the French interpretation of international etiquette.

For Germany, a conquered country, and Russia, an outcast government, to conclude a favored-nation agreement, was astounding impudence. France was so angry she almost excluded Germany and Russia from the Genoa Conference, in which she had planned to exact reparations from the Germans and ancient debts from the Russians.

To the American sense of retributive justice, the treaty seems only the result of the long-continued goading by the nation now most incensed.

Mr. Ford's Page

WE ARE not wholly public characters, however public our activities or interests may seem to be. But there is very much in these times to induce us to think that we are public characters, and that the be-all and the end-all of our careers hinges around the progress of some social or industrial or political movement from which we may hope much good for the world.

Most of us are public characters in that sense and to this degree: we live and find our chief concern in the changing tides of life. We identify our own faith or satisfaction with the triumph of some cause which is expected to bring more of justice or opportunity or happiness among men.

But "movements" move so slowly. The thing which we may so clearly see as the right thing to be done, may wait for half a century, while other matters, of apparently less urgency, crowd in for early adoption. That is one of the pains incident to a public-spirited view of affairs—the weary slowness with which good causes seem to move. When we think of those who early saw that slavery had to go, and yet who went themselves into the unknown before Slavery had even become a public question; when we think of the other reforms whose sponsors for a lifetime endured not only opposition (for opposition may denote understanding) but unintelligent ridicule for a cause that was sacred to them, and yet never had so much as the satisfaction of seeing their cause command even a little of public curiosity—when we think of all this hope deferred, it becomes clear that a person cannot take refuge in public spirit alone; he must have a private life in which to retire at times.

We crave to see progress somewhere; sometimes people are stopped from seeing progress anywhere but in themselves and in their own lives. And if progress were not possible there, life would be all externals; as it is, the best part of life is private.

Now, in these times, there is just a danger that people will forget that occasionally they ought to retire inwardly and escape the long-drawn disappointment of slow-moving "movements." If the movement is going to overlap our lives so that we shall not be present at the victory, we shall have to find the sense of victory somewhere else, without in any way losing our loyalty to the cause which may come to fruition half a century hence.

It is true, of course, that in these times there is a greater rapidity of growth than at any previous period. Ideas ripen faster in this period of the world than they ever did before. Nations knit vision and action together more readily than they have ever done. In the realm of ideas more progress can now be made in five years than was formerly possible in a century. The rapidity of communication is an illustration of what is occurring between vision and realization.

But even so, needed and undisputed reforms often wear out the patience, they are so long delayed. There is no one to command the new era into being; no executive order sets aside the old and wrong, to bring in the new and right. And thus many excellent and necessary reforms have to wait for a long winter to end and a backward spring to arrive. We are all filled with the spirit which demands that if the thing is right, it should immediately be established. But it is not immediately established.

We are pretty certain that this country is at the end of one stage and ready to enter another. Every unmistakable sign points to that. The rift between what was and what shall be is as plain as a rift in the clouds or a rent in a fabric. Something has ended, something is slowly slipping away—that much is certain. We are at a division point in history. There is complete helpfulness among the attachés of the old order, and hopefulness among those who look for the new. But still the fact remains, that no matter how clearly men may see the new, it comes but slowly.

There is no question that it could be assisted to come much more rapidly. If the powers that be were members of the age to come, they could materially assist its coming. But they are among the things which are slowly disappearing into the past. And the process of disappearance is not what the people want today; they want to see appearance. The old, even in its passing, seems so very like the wrong thing which the people have always had with them, that it seems stationary. They can see the old, but not the new. Apparently, to them, there is no progress. If their whole happiness consists in what they can see in the outside world, they are without much happiness.

As a matter of fact and experience, affairs do not move as rapidly as the vision of men would justify. They never do. The affairs of the race overlap the lives of many individuals.

OURS is the Bridge Generation by which those who belong to the new era may cross over. We are set between two worlds, one passing into oblivion, the other just emerging into life, and it is in our time that the transition from one to the other shall be made. The remains of the old must be decently laid away; the path of the new prepared. That is the difference between Revolution and Progress. What this generation will see as a matter of established reform is one thing; what it is actually seeing, and serving, and having a part in, is the shifting of the scenes, the movement of new and advanced ideas and ideals into commanding position.

And yet it is due to each self-conscious generation that it see some progress in its ideal desires, that it see some portion of its spirit materialized for the service of those who succeed it.

This present generation is the Bridge Generation, over which the nation, and perhaps the civilized world at large, is passing from the old to the new era. Only once before in the history of this country was there need for a Bridge Generation. And if those who are finding most of their interest in the affairs of the nation and humanity, will understand the function which they collectively perform, it will do much to help toward a larger interpretation of events. If movements move slowly, from the old to a new, there must be a bridge across which to move, and that bridge can only be made of people who can knit up the raveled fringes of the old, and place the warp and woof of the new upon the loom of destiny.

When there is no Bridge Generation, what happens? Trouble. The race, finding no foothold, plunges into confusion. Revolutions have been failures on that account; they are not bridges; they are abysses into which men fall. And when men scramble out again, it is mere chance whether they climb back on the side from which they fell, or struggle forward in distress toward the side which they so blindly sought.

This generation is set to prevent that. It stands here between two worlds, one receding into the sunset, the other coming to view in a misty sunrise. Those who belong to the old order will go out with the old, and those who belong to the new order will come in with the new—and they will come in over the bridge of this generation which stretches between the old and the new to make a path across. That is glory enough for one generation. But it is painful work, it requires established faith, sublime patience and unconquerable courage.

Armies march over the roads that other men have built, but the road builders rarely share in the military glory. There have been periods of preparation, the participants of which have not seen the latter achievement. So this generation may not see all that it hopes to see, but it may have this knowledge: that it was the Bridge that carried the conquerors over. To hold the bridge, to let the new era come in, is a greater glory than to march. Yet the fact remains that many who man the bridge will take up the march also and will see the incoming of all the reforms and readjustments and reorganizations for which all phases of social life call out.

Training Thoroughbred Plants for the Table

Little-Known Men Work Wonders in Making Nature's Fine Products Finer

Professor Charles Haralson and his helpers.

By E. I. FARRINGTON

CERTAIN men have done such spectacular things in the way of plant breeding and hybridization that they have gained titles of plant wizards. There are others, little known to the general public, who have worked wonders in bettering the natural products of the earth.

In Central New York lives Calvin Kenney. Mr. Keeney is the man who took the strings out of string beans. Surely, that is achievement enough to give anyone fame. Everybody knows string beans were very properly named. Formerly, it was always necessary to unwind a snarl of strings in dining on this vegetable. Mr. Keeney grew beans for seed, hundreds of acres of them. He realized the desirability of the stringless string bean, and set about to produce one.

Mr. Keeney got down on his knees and crept from plant to plant, trying to find a single bean without a string. He broke hundreds of beans, and spent weeks in labor before his reward came. Then he found a bean which did break clean. He marked the bush on which it grew with a white rag, and continued the search. Only a few plants were found in the whole field, but the seed from them was saved very carefully, and the next year planted in a separate plot. A considerable proportion of the beans from this plot were also stringless. They, too, were saved, and planted. This process was kept up for several years, until practically every bean was a stringless bean.

CALVIN KEENEY,
Who unstrung the string bean.

Down South lives "Old Sol" Wright, the man who gave the rice growers the Blue Rose variety. Salmon Lusk Wright is his name but he is better known to his associates by the name of "Old Sol." Mr. Wright has done for rice producers what Mr. Keeney has done for bean growers. He went to his fields one day and returned with a pocket full of rice grains from various rows. He shelled them and found a big difference in the grains. Some were long, some short, some fat and some thin. Many were stunted, and not a few misshapen. Several hours that night were spent in an effort to find a perfect grain. Disappointment was the result. Again and again he had this experience. At last, however, several berries were found which approximated his ideal. They were carefully planted and the seed from them collected. Slight improvements were noted, and another crop was nursed along.

For months Mr. Wright spent his evenings examining hundreds of tiny berries by an oil lamp. For six years he worked this way, until he had accumulated several hundred greatly improved grains. In 1911 an almost perfect American-grown seed rice had been produced. It was found to yield from 25 to 30 per cent more head rice than any other variety. Mr. Wright called his new strain the Blue Rose. It was an odd name, and this is the way it came about:

While Mr. Wright was spending his long evenings inspecting rice seed, his wife's mother read to him. One night she read a story telling of the labors of a priest who perfected rare roses. A parishioner, intending to be sarcastic, asked the priest why he did not produce a blue rose. The priest replied: "My dear man, if I could do that I would not have to be your priest any longer."

At this point Wright stumbled on the perfect grain he had so patiently sought for years, and on the spot he named it the Blue Rose.

It is one thing to perfect an improved grain of rice, and another to get the growers to adopt it. The mills knew only Honduras and Japanese rice. The growers were afraid that the mills would not buy their product if it were a new kind. At last, however, all prejudice has been broken down. In a single year, Wright has sold twenty-three thousand dollars' worth of seed. Forty bushels returned to one grower an income of $4,600. At the present time, Blue Rose is being planted on nearly 400,000 acres, or more than half the total rice area of the United States, and "Old Sol" Wright is known all over the South as the man who has saved the rice industry for America.

When people were told a few years ago that a strawberry which would bear all summer had been developed, they were inclined to raise their eyebrows in surprise. Now fall-bearing and everbearing strawberries are no longer novelties. It is as easy to eat strawberries in the fall as in the spring.

For nearly 20 years, Harlow Rockhill, of Iowa, worked to breed strawberries which would produce continuously throughout the season. Thousands of seedling varieties were developed. A few gave promise, while the majority were discarded before success came. Mr. Rockhill, though, was not the only man who hit upon the idea of fall-bearing strawberries. Samuel Cooper had the idea in mind and he, too, was successful.

The fall-bearing strawberry is especially valuable for home gardens. It produces a big crop in the fall if the blossoms are picked off until the first of July. Then the next spring the same plants yield another generous supply of large, red, juicy berries. These berries grow best in hills where they can be kept cultivated. In the fall, it is a common thing for growers to receive 40 or 50 cents a box, and oftentimes the plants keep on bearing until the fruit is frozen on the vines. Certainly, strawberry lovers owe a debt to these modest men who have given much of their lives to the improvement of fall berries.

SALMON LUSK WRIGHT,
With his Blue Rose rice.

Sometimes, an improved variety of fruit is obtained much more quickly. The strawberry is a notional fruit. Varieties which thrive in one section are almost useless in another. Some years ago, farmers south of Boston needed a better strawberry than any which they had been able to grow. Among them was Lester Blanchard. Going through a small patch of berries in his field, he saw one which was easily distinguishable from the others. It seemed unusually large and solid. Mr. Blanchard dug up the plant to use for propagation purposes. In a few years, he had grown enough plants to set out a field and start producing the berries commercially. This was the origin of the Abington strawberry, now one of the leading varieties of the East, and a berry which can be shipped to market under conditions fatal to other varieties.

Originally, Minnesota was not looked upon as a fruit-growing state. Yet, several horticulturists, working on the experimental farms established by the state, have produced a number of splendid new plants, some of which are especially well adapted to northern climates. Professor Charles Haralson, superintendent of the Minnesota Fruit Breeding Farm, worked quietly for years testing thousands of seedling berries and larger fruits.

Perhaps the finest of his new fruits is a raspberry which was first called Minnesota No. 4 but is known now as Latham, being named for the secretary of the Minnesota Horticultural Society. Many common raspberries are not sufficiently hardy to go through a Minnesota winter. This new variety, however, is hardy and produces a great amount of large, delicious fruit.

Most of us are acquainted with the loganberry which comes from California. There are various stories about its origin. Many attribute it to Judge J. H. Logan, of Santa Cruz. In 1880, Judge Logan started a fruit and vegetable garden, planting every variety of blackberry and raspberry he could obtain. A great many seedlings were raised, and one day Judge Logan noticed one entirely unlike the others. A few weeks later, the berries began to ripen. Judge Logan realized that he had discovered a new fruit, and took pains to propagate it. He named it the Loganberry. This berry, a cross between the raspberry and the blackberry, has several advantages over each. The berries grow very large, and the yield is enormous. It is said that a hundred small fruit basketfuls have been taken from one plant. It contains a great amount of juice, so refreshing that it has been put on the market as a beverage.

J. F. JONES

The time may come when nuts will be depended upon to feed the world. Before the war, nuts constituted the largest single food item among our imports, the value reaching $22,874,000. Thousands of strong, energetic persons take 75 per cent of their protein from nuts, and thousands more could do so to advantage. For years a number of enthusiasts have been devoting their time to the development of better nut trees. One of these men is David Bush, an old-time Pennsylvania horticulturist. Mr. Bush has made eating easier by perfecting nut strains which have thin shells, easy to break, and a large amount of meat. Mr. Bush and others have produced pecans which can be grown in the North, and walnuts which thrive in New York State.

The development of better qualities in nuts has engaged the attention of many scientific and studious farmers. L. F. Wilkinson, of Rockport, Indiana, is one of these. Born and reared on the spot where he now lives, he has given lifelong study to nut culture with important results.

In addition to practical efforts to better the quality of nuts, J. F. Jones, of Lancaster, Pennsylvania, has given much time to preaching to the general public the value of nuts as foods and of nut-bearing trees as valuable shade trees, important to the growth of vegetable life in general. "Jones, the Nut Man" is the title by which he is known far and wide, a title, by the way, in which he takes the greatest pride.

There are many others whose quiet work for the advancement of their profession of cultivating the soil have contributed largely to the uplift of vegetable food. But for want of a press agent, most of them work their quiet wonders, unknown to the world they aid.

James Oliver Curwood Finds the Soul of Nature

The Killer Who Has Turned Tells Why He Now Fights for Wild Life

"THERE was a time when I took pride in the wideness and diversity of my killings. I was a destroyer of life. Now I am only glad that these killings ultimately brought me to a discovery which is the finest thing I have to contemplate through the rest of my existence."

Surrounded by his books, cases crowded with stuffed birds, and with more than a score of guns notched at the stocks, recording in Indian fashion the killings, James Oliver Curwood was making this confession. It was in his home at Owosso, Michigan, a growing city of approximately 15,000, not far from Lansing, the capital of the state. The early sun of spring was shimmering on the reddish brick of his residence—the earnings of many a quirk and smile in the realm of fiction. The last vestiges of winter were vanishing and children were playing marbles over the dry spots in the streets. The naked trees of the yard had not broken into spring attire, but there was a richness of air, a stench of rain-washed lands, a steaming, pulsing of earth, that were already calling Mr. Curwood, the author, to prepare for his summer trip into the wilds of Canada.

JAMES OLIVER CURWOOD

Mr. Curwood in the cabin home where he wrote "God's Country—The Trail to Happiness." Mr. Curwood built this cabin in the British Columbia mountains.

Within this home are the evidences of the life of its resident. There was his row of 24 books—three of which have headed the list of the six best sellers. Many of these have been translated into seven different languages. Here was one of the largest collections of great game photographs in America, taken from life by himself. Mr. Curwood has come to be recognized as one of the foremost authorities on matters pertaining to the Canadian Northland; he spends several months in the wilds each year traveling as far north as the Arctic coast, and he is the only American ever employed by the Canadian Government as an explanatory and descriptive writer. About him were the guns by which he had peopled the walls and the corners with stuffed beasts.

"Now I am fighting for wild life harder than I ever hunted," commented Mr. Curwood, looking toward the guns. "With them, I have left red trails to Hudson's Bay, to the Barren Lands, to the country of the Athabasca and the Great Bear, to the Arctic Ocean, to the Yukon and Alaska, and throughout British Columbia. This is not intended as a pean of triumph. It is a fact which I wish had never existed. And yet it may be that my love of nature and the wild things, at the last, is greater because of those years of reckless killing. I am inclined to believe so. In my pantheistic heart, the mounted heads in my home are no longer crowned with the grandeur of trophies, but rather with the nobility of martyrs. I love them. I am no longer their enemy, and I warm myself with the belief that they know I am fighting for them now.

"In this religion of the open, I have come to understand and gather peace from the whispering voices and even the silence of all God-loving things. I have learned to love trees."

"What is the greatest thing each state can do to aid its conservation of wild animals?" was asked as Mr. Curwood paused.

"I am not merely fighting for the conservation of wild life," replied Mr. Curwood. "It is my belief that next to God and religion the two greatest words in the languages of all the world are conservation and propagation, but of all natural resources, and especially forests. Our future, our very lives, you might say, depend on the conservation of the resources which nature has given us. We have annihilated our forests to such a point that Michigan, for instance, is now a wood-importing state, where only a short time ago it was one of the greatest timber producing states in the Union. Last year the freight bill for Michigan's imported timber alone was $10,000,000, or sufficient to re-forest 150,000 acres of our 10,000,000 acres of burned over and waste lands. And wild life as well as the welfare of the human lives depends first of all upon our forests. Without forests our rivers will become barren and dry up, and our smaller lakes disappear. And the wheels of almost every industry will cease to move. My belief is the biggest thing a state can do toward this conservation is to take the work of conservation and propagation out of politics. Politics can run a government or a nation, but politics can run neither God nor our national resources. When it comes to religion and conservation the rule of politics, greed and ambition is a menace and a crime."

Mr. Curwood and one of his favorite dogs.

Mr. Curwood's home at Owosso, Michigan.

Mrs. James Oliver Curwood on a long and adventurous trip with her husband in the British Columbia mountains, just under the Yukon.

"Should there be courses taught in the public schools to give children a better understanding of the habits of wild animals and the necessity for conservation?" he was asked.

"Again you limit yourself to animals," he replied. "We must broaden this, also, and when we do broaden it I answer emphatically, 'Yes!' The most logical and best place to begin teaching humanity the value and necessity of conservation and propagation of our natural resources is in the public schools. Children should be made to understand that trees are as important to the welfare of this earth as they themselves are. They should be made to realize that when Michigan cuts down each year more than 1,500,000 Christmas trees we are destroying an incalculable amount of timber. They should be taught to see the necessity and beauty of planting trees, and of protecting all forms of wild life which are not inimical to our welfare. They should be made to understand that if all wild life and all vegetation were taken from the earth tomorrow, the human race would within a very short time become as extinct as the Dodo and Brontosaurus. Within a few months the whole world would be a madhouse of disease, famine and death. To my mind, the most beautiful thing in the world is to teach a child not only the necessity of protecting and encouraging nature, but the beauty of it as well."

"What is the most striking single incident you have encountered showing the understanding of wild animals?"

"I think the most dramatic climax of my desire to let live came when I was seeking material for my book, 'The Grizzly King,' declared Mr. Curwood. "With a pack outfit of a dozen horses I had gone into the British Columbia mountains, and in a wonderful valley I came one day upon the track of a huge grizzly bear. It was the biggest track I had ever seen, and as there was no particular limit set to my time, I struck camp. For three weeks my mountain companion and I hung to that grizzly. He was a monster, weighing 1,200 pounds, if he weighed an ounce. I watched him feed. I saw him fight. I followed up his daily life until gradually there came over me an overwhelming desire to possess the skin and head of this king of the mountains for my-

How Our Federal Pension System Operates

Handling Stupendous Sums of Money and Adjusting New Claims Entails Painstaking Labor and Careful Investigation by Experts

By WASHINGTON GARDNER

United States Commissioner of Pensions in an authorized statement to A. R. Pinci.

THE average citizen—and certainly the average taxpayer—knows that one of the many government problems is that of pensions, and that there exists at Washington a Bureau of Pensions. The building that houses the bureau is one of the points of interest to the visiting tourist, but it is hardly likely that this casual visitor realizes the magnitude of the business administered within its historic walls. Yet more than $6,000,000,000 have been disbursed for pensions and for maintenance of pension systems from 1790 to 1921.

The pensioners of the United States are subdivided into several classes. They include pensioners of the Revolution—the oldest class on the roll—of the War of 1812, of the early wars with the Indians, of the Mexican War, of the Civil War, of the Spanish-American War and the subsequent insurrection in the Philippines, and of the World War, where services therein were rendered prior to October, 1917. There are also other pensioners of the regular military and naval forces and a few unclassified pensioners.

The pensioners are not all soldiers, or even former soldiers. They represent widows, minor children, dependent persons and army nurses. More than 3,000 of them are scattered over wide areas outside the United States, from Tasmania to Mauritius, and from China to Norway.

Half Million Pensioners

AT THE end of the fiscal year 1921 there were 566,053 pensioners on the roll. The largest number of names in any one year was in 1902, when it totaled 999,446—a total that may be better understood if one thinks that it is only 554 less than a million. In 1866, one year after the close of the Civil War, there were 126,722 pensioners.

Losses to the pensions roll are caused chiefly by death, but there are also other causes, such as remarriage of widows, minors attaining the age of 16 years, failure to claim for three years, and the like. Gains are made chiefly by original allowances, but also, in some cases, by the restoration of forfeited pensions. Since 1910 the loss of Civil War soldiers has averaged about 30,000 a year. Last June there were 218,775 of them, as against 243,520 the preceding year, while the largest number of them on the roll was reached in 1898, with a total of 745,822.

The exact amount paid to pensioners between 1790 and 1921, a span of 131 years, is $6,089,536,537.71, while the cost of maintenance of the pension system from 1866 has been $138,683,653.30. As the disbursements have been made in sums ranging from a minimum of $2 a month to a maximum of $416.66 2/3 (the greatest number of pensioners received, however, pensions of $30 or $50), it is evident that a vast amount of careful clerical work and accounting is necessary.

It is not the stupendous sums paid out annually or the number of persons served that makes the record of the work of the Bureau of Pensions remarkable, but the close scrutiny which must follow every application for a pension to insure that, if granted, the money shall go to the rightful recipient for the purposes intended.

On May 1, 1920, there was approved by the Congress an act to revise and equalize rates of pensions to certain soldiers, sailors and marines of the Mexican and Civil wars, including widows, former widows, dependent parents and children, and certain army nurses. A few weeks later another act was approved to pension soldiers and sailors of the Spanish-American War, including the Philippine Insurrection and the relief expedition in China.

Painstaking Care Necessary

THE passage of these acts required the forming of a section of experts to investigate and determine promptly where increases could be granted to the pensioners already on the roll in cases not requiring new applications. This work has been well and expeditiously done, and yet on January 1, 1922, there were 65,541 claims on hand under the operation of these two single acts.

It is needless to say that with hundreds of thousands of pensioners scattered in 48 states, the District of Columbia, five insular possessions, and 67 foreign countries (including dependencies), there is much possibility of mistake and misunderstandings, if not necessarily of fraud. Nothing must be taken for granted. The operation of the pension laws, furthermore, in many respects makes the bureau's work quite complicated.

Handling pension claims is routine work, but it requires painstaking care. Many persons have an erroneous impression that is a simple thing for the Pension Bureau to take up a pension claim and immediately dispose of it. As a matter of fact, it is often a most difficult matter to adjust.

In claiming a pension, an application must be filed in the Pension Bureau, stating under what law the claim is made, accompanied by the facts on which it is based. After the validity of the declaration is determinated by the Law Division, a record is made and the claim receives a number. This record is made in various ways for statistical purposes and for information, and so that the claim may be found readily. There are about 6,000,000 record cards on file today.

The claim thence is submitted to adjudicating divisions made up of experts who by training, study and experience have qualified themselves for obtaining, examining and weighing the evidence on which pension claims are based. In due time the Board of Review gets the case. No claim is rejected unless it has been considered and disallowed by an examiner, a reviewer and a final reviewer, while every claim that is allowed must have the concurrence of three experts of the same class.

Many times it is necessary to make an inquiry in the field. These inquiries are made in the case of doubtful or difficult claims, or those in which criminal features are involved. Should a medical question present itself for solution, it is sent to the proper division, which has the assistance of about 4,000 physicians throughout the United States. If questions of law are involved, too, these are sent to the Law Division, which passes on questions relating to attorneyship, guardianship, marriage and divorce.

The Bureau of Pensions under these circumstances is not a mere administrative office. It is called upon to construe the law and to exercise judicial functions, determining the rights of claimants and of the government under the law and facts, and in this manner acts as a court. The numerous pension laws have required much consideration and interpretation, and there are 20 octavo volumes containing the opinions of the Secretary of the Interior on questions that have arisen in pension cases.

Of course, the Pension Bureau cannot undertake to determine, in advance of the filing of a claim and necessary evidence, whether a pensionable status exists, yet requests for information of this kind are constantly being received from individuals who believe they have claims, such as dependent parents, invalids, minors and widows. Each class, as well as each case of each class, is governed by laws and regulations, and as already pointed out, every claim must be analyzed by experts *after* it has been filed.

Delay a Serious Matter

THE speed with which the work is handled depends, of course, on the number of employes. In 1921 there were 867, a decrease of 37 from the previous year. The claims last year were disposed of at a cost for salaries and other expenses of administration of $17.25 per claim, while the actual cost of disbursement was 10¼ cents for every $100.

The available force of employes is not sufficient, however, to cope with the great influx of claims. To be in arrears in the consideration of claims for pension is a serious matter. Comparatively few persons who are entitled to a pension are in such financial condition that they do not stand greatly in need of the money granted by a generous Congress. All we can say is that the delay is absolutely unavoidable and that claimants must wait with patience until their claims are reached in their regular order. Congress alone can remedy the conditions as they exist by authorizing a temporary addition to the working force.

On the other hand, liberalization of practice has been effected lately, for the sake of efficiency. The Bureau of Pensions has been often reproached for a policy and practice thought to be too narrow, restricted and technical. This has been accentuated when brought in contrast with the liberal treatment accorded the veterans of the World War both by Congress and by those charged with the administration of the laws passed for their relief. In the belief that like liberal treatment should be accorded to those coming within the purview of pension legislation, the present administration has made several modifications of the practice of the bureau. Whatever grounds there may have been for criticism, the object now is to do justice to all by eliminating technicalities as far as possible.

Helpless Helped First

AN INSTANCE of the new policy will be cited. A provision of the Act of May 1, 1920, grants $72 a month to Civil War veterans "helpless or blind, or so nearly helpless or blind as to require regular personal aid and attendance." Under this provision 38,938 Civil War veterans applied for the $72 rate during the last fiscal year, and additional claims are now coming in at the rate of approximately 3,000 monthly. In view of the great age and the helpless condition of these applicants, their claims are being given special attention and everything is being done to bring about their early settlement.

Another instance provides that the ratings granted Spanish War veterans shall be proportioned to the degree of inability to earn a support by manual labor. Departing from a fixed, arbitrary scale of rates, the test in each case now is the extent to which inability to earn a support is lessened.

In other instances, however, the Bureau of Pensions cannot exercise authority in expediting the work at hand without remedial legislation. One of these relates to the proof of marriage. This law's requirements have given rise to much complaint, and in numerous cases imposed upon widow applicants a peculiar hardship, made more manifest by the lapse of time. Yet the Pension Bureau has no power to change the law. The recent legislation in behalf of the widows of World War veterans is much more liberal in this regard and permits the indulgence of presumption of marriage in the absence of proof in certain cases and under certain conditions. It is hoped that this liberality of law favoring widows of veterans of the recent war will be extended to the widows of veterans of the Civil War, the war with Spain, or of those who served in the regular establishment prior to April 6, 1917.

There seems to be a general demand among all classes of pensioners for the monthly payment of pensions. Congress has recognized this demand. The Bland bill has been passed by the House of Representatives and is now in the hands of the Senate. The arguments in favor of monthly payment of pensions are patent to everybody. The passage of this bill for monthly payments is strongly recommended.

Another activity of the Pension Bureau has to do with the administration of the Civil Service Retirement Act, approved May 22, 1920. Under its provisions are included all employes of the classified civil service of the United States, representing one of the largest groups of employes ever to be covered by a single retirement fund.

62 Widows of 1812 Soldiers

SINCE the organization of the new retirement division 18 months ago, 7,076 claims for age annuity and 1,261 claims for retirement on account of disability have been filed. This branch of the work is considered as being practically current.

During the same period 80,500 applications for refund have been filed by former employes who have become separated from the service because of resignation, dismissal, or necessary reduction of force. The work of adjudicating this class of claims is about four months in arrears. An amendment to the act which has already passed the Senate and is now pending in the House will, if enacted, facilitate the adjudication of claims for refund.

A few figures on the pension situation will be undoubtedly instructive.

The number of certificates issued on account of all claims allowed since the establishment of the pensions system down to the end of the last fiscal year was 6,302,836. Congress granted 59,124 pensions by special acts since March 4, 1861. Of the total number of pensioners on the roll last June—566,053—by classes they are as follows: soldiers, 267,629; widows, 290,955; minors, 2,163; helpless children, 919; other dependents, 4,285, and nurses, 102.

Sixty-four pensions were still being paid on account of the War of 1812, although more than a century has passed since the termination of that war. All these, with one exception, were drawn by soldiers' widows, there being now no survivor of the men who fought in that conflict.

109 Mexican War Veterans

THERE were still 2,244 pensioners of the Mexican War, 73 years after it ended. Of these 109 were survivors, and 39 of them died during the fiscal year.

In the past year 24,775 Civil War veterans died. During that period widows who filed claims for pensions numbered 14,753. From these figures some idea can be formed of the number of widow claims that will continue to come in as the veterans yet on the roll gradually pass away. In fact, during the year 1919 the number of Civil War veterans' widows passed the number of veterans on the roll, and at the close of the fiscal year the number of widows was 281,225, as against 218,775 veterans.

Even the brief war with Spain was noted on the pension roll by 39,282 entries on the date stated.

By states, Ohio led in number of pensioners, with 56,960, Nevada holding last place with 270. Alaska had 43. Of the foreign countries or their dependencies, Canada led with 1,623, and 16 places, from British Guiana to Egypt, Portugal to Siam, had each one pensioner. The total amount of foreign disbursements was, for the fiscal year, $1,342,022.37.

Subdivided by different wars, the total disbursements last year were: Civil War, $246,584,640; War with Spain, $6,171,570; War of 1812, $24,160; War with Mexico, $888,025; Indian Wars, $1,565,862; regular establishment, $3,456,191, and World War, $25,394. The average pension for each class was $477.74, $164.34, $356.63, $373.37, $203.71, $183.49 and $238.62, respectively.

"No Interest to Be Collected for Three Years"

Tiberius Stopped Rome's Worst Panic by Defying Money-lenders; But Governments Forget and Doctor Bond Malady With More Bonds

By JOHN BASIL BARNHILL

IN THE year of the Crucifixion, 33 A. D., during the Consulship of Galba and Sulla, the Roman commercial world was shaken from center to circumference by the greatest panic known to its history.

A vivid account of the panic is found in the pages of Tacitus and Seutonius. About a year before the panic, trade reverses and the loss of three richly laden spice ships on the Red Sea had jeopardized the position of the firm of Seuthes and Son, of Alexandria. A little later the firm of Malchus and Company at Tyre, with factories at Antioch and Ephesus, went bankrupt owing to a strike among their Phoenician workmen and embezzlements of the manager. When it became known that the great Roman banking house of Quintus Maximus and Lucius Vivo had loaned largely to both Seuthes and Malchus, depositors started a run on these banks. The still larger house of the brothers Pettius was involved and in one day all three banks closed their doors.

This great Roman panic had all the characteristics of a modern panic. Banks in Corinth, Carthage, Lyons and Byzantium went down before the cyclone and after this nothing seemed able to check the flood of insolvencies. One bank after another closed. The 12 per cent legal rate was set at naught by any man lucky enough to possess ready money. The Praetor's court was crowded with creditors demanding the auctioning of the debtors' houses, slaves, warehouse stock or furniture. The auctions were thinly attended, for who could buy? Valuable villas and racing studs were knocked down for trifles. Caught in the disaster many men of excellent credit and seemingly ample fortune were reduced to beggary.

The calamity seemed spreading over the empire and threatened a stoppage of all commerce and industry when Gracchus, the Praetor, unable to decide between the hosts of desperate debtors and equally desperate creditors, invoked the aid and advice of the Senate. After a hurried debate the Conscript Fathers dispatched a fast messenger, with a full statement of the danger, to the Emperor Tiberius, in his retreat at Capri.

Four days later a vast throng, slaves and millionaires elbowing together, filled the forum while the emperor's reply was read, first to the Senate and then from the open rostrum, to the waiting people outside. Tiberius' accustomed good sense was apparent in his solution of the problem. He ordered 100 million sesterces (four million dollars) to be taken from the imperial treasury and distributed among bankers to be loaned to the neediest debtors; *no interest was to be collected for three years.*

Gradually, the Via Sacra (the Wall Street of Rome) resumed its wonted aspect. We are told by the historian Stearns that a few banking houses and individuals never recovered their losses but that the majority escaped permanent suspension.

Undoubtedly, the crux of this imperial remedy is found in the canceling of all interest obligations for three years. If such a remedy could be applied to the panic that is threatening, not one but all empires and nations, beyond all question it would prove more effective than any other conceivable remedy. In the United States alone, it would liberate approximately five billion dollars annually and appropriate it to productive purposes rather than to mere payment on dividends. We have the high authority of Governor Strong of the Federal Reserve Bank of New York City that money cannot be used to pay interest on debts and at the same time to purchase goods.

Undoubtedly, if the remedy by which one of the wisest of Roman emperors saved the empire from utter destruction could be applied to the present situation the effect would be to reanimate the dead corpse of public and private credit as by a miracle. Is there enough real statesmanship at Washington to apply this remedy? The question answers itself. Hilaire Belloc, one of the most acute critics of contemporary politics, says: "In all parliamentary countries a few intriguers are the unworthy depositories of power, and by their service of finance permit the money dealers to govern us all today"; in other words, *Wall Street is identical with the government.*

The visible government has long been the obsequious servant of the invisible government. Verily the battle is with principalities and powers in the highest places. It affords food for serious reflection that, while in 33 A. D., Tiberius defied the money-lenders, in 1907, during a similar panic, our Executive called in the chief of the money-lenders and asked him how to stay the panic. His answer is well known—it involved the condition that he must be permitted to absorb his chief competitor, the Tennessee Coal and Oil Company. In such crises today, the government knows but one solution, the creation of more interest-bearing bonds. Verily these bonds do not belie their name.

No words can exaggerate the gravity of the situation. Well may be asked, will the people awake in time? When threatened with despair I turn to that great prophet, Hilaire Belloc, who in his "Robespierre" sums up in unforgetable language the supreme lesson of the French Revolution and of all popular movements for the revindication of long-outraged justice:

"But for all the tortuous errors and overgrowths of time, there is a remedy, and that remedy is the blood in us; the fields and rivers. The old thing out of which we draw (what they used to call the Mother of the Gods) is simple and resolves all things backward into simplicity. Therefore, when once in a thousand years accumulated evil by some quick accident arouses nature, all the State grows young and is ready to combat—a new religion leaps out like a sword. Its unity and simplicity are keen, like the edges of a sword. It cuts off the bonds of men so that they wonder how bonds were ever laid on them. In these moments it is easy to rebuild a world; and then time comes in again to corrupt, and corruption awaits another resurrection."

Intrepid souls have ever drawn from the very darkness that envelops them their chief inspiration, for with such it has ever been an accepted formula of faith that it is always darkest just before the dawn. In such troublous times as these the wise words of William Godwin ought to guide and inspire us. In his "Political Justice" he says: "We must distinguish carefully between instructing the people and exciting them."

Interest, the Mother of Debt

Half National Wealth Mortgaged

"THE progress of the national debts which oppress, and will in the long run probably ruin, all the great nations of Europe."—*Adam Smith (1776).*

"The practice of contracting debts will almost invariably be abused by every government. It would scarcely be more imprudent to give every prodigal son a credit with every banker than to empower statesmen to draw bills in this manner on posterity."—*David Hume.*

"Let us understand then, in the outset, the moral difference between a national debt and a national store. A national debt, like any other, may be honestly incurred, in case of need, and honestly paid in due time. But if a man should be ashamed to borrow, much more should a people: and if a father holds it his honor to provide for his children, and would be ashamed to borrow from them, and leave, with his blessing, his note of hand, for his grandchildren to pay, much more should a nation be ashamed to borrow in any case, or in any manner; and if it borrow at all, it is at least in honor bound to borrow from living men, and not indebt itself to its unborn brats. If it can't provide for them, at least let it not send their cradles to the pawnbrokers and pick the pockets of their first breeches. A national debt, then, is a foul disgrace, at the best. But it is, as now constituted, also a foul crime. National debts, paying interest, are simply the purchase by the rich of the power to tax the poor."—*Ruskin, "Fors Clavigera."*

"You spend eighty millions of money in fireworks, doing no end of damage in letting them off. Then you borrow money to pay for the firework-maker's bill, from any gain-loving persons who have got it. And then, dressing your bailiff's men in new red coats and cocked hats, you send them drumming and trumpeting into the fields, to take the peasants by the throat and make them pay the interest on what you have borrowed, and the expense of the cocked hats besides. This is 'financiering,' my friends, as the mob of money-lenders understand it. And they understand it well. For that is what it always comes to finally; taking the peasant by the throat. *He* must pay—for *he only* can. Food can only be got out of the ground, and all these devices of soldiership, and law, and arithmetic, are but ways of getting at last down to him, the furrow-driver, and snatching the roots from him as he digs."—*Ruskin in "Fors Clavigera," Letter 8.*

"Public credit means the contracting of debts which a nation can never pay."—*William Cobbett (1762-1835).*

There is a patent contradiction in the term, "Public debts." If we spoke accurately we would call them debts owed by the "Public," and owned privately. The whole question of private credits, for the adjustment of which the public is held responsible, will assuredly stand a thorough re-examination at the present moment when our leading economists are demanding their cancellation by billions of dollars.

"Three reforms are necessary steps in the establishment of peace: (a) the creation of a real democracy; (b) the transfer of the right to declare war from the sovereign to the people; (c) the abolition of the power to contract public debts, which makes it easy for states to obtain the financial means required for war without any popular control."—*Kant.*

"The national debts of Europe represent a series of colossal crimes against the people. They were incurred in the prosecution of unnecessary wars and for the support of unnecessary standing armies. One class, representing less than one per cent of the people, owns the debts—the other class pays interest on them. Every child inherits either an estate in these debts or an obligation to pay interest on them. Thus the fruits of a great crime have been transmitted into a vested right to one class of people or a vested wrong to another class."—*Kim's "Mind and Hand."*

"There is nothing really more monstrous in any recorded savagery or absurdity of mankind, than that governments should be able to get money for any folly they choose to commit, by selling to capitalists the right of taxing future generations to the end of time. All the cruelest wars inflicted, all the basest luxuries grasped by the idle classes, are thus paid for by the poor a hundred times over."—*Ruskin, "Fors Clavigera."*

"As long as the British aristocracy carried on war itself and bore the expense, a public debt did not exist. When, by their increasing powers in the House of Commons, they could saddle the debt on the working classes, debts began to rise and war after war followed."—*Bloch, "The Future of War."*

Are we not justified in saying: "No interest, no bonds?" Debt is but a means to an end: the end sought is interest. It would appear, therefore, that the advocates of the cancellation of war debts have put the cart before the horse. They deal with effects rather than with causes: interest is the cause. Let them cancel all war debts: if they leave interest untouched, they have left untouched the cause of debts—the same sinister enormity which has produced the *inferno* from which man cries to be delivered, is left in all its power to work out the same evil destiny.

In addition to the war debts which, so far as Europe is concerned, it is admitted can never be paid, there are also debts of the states, counties or municipalities. There are also the debts of the public utilities and of the corporations, both great and small, the mortgages on farms and city real estate; to which must be added chattel mortgages on farm implements and household goods, not forgetting the ubiquitous automobile, and last of all there are the promissory notes of the business man owing to the bank.

This mass of debts is literally mountain high and has been computed to be a sum equal to a third if not half of our national wealth, both public and private.

Not only is the interest on this principal a constant drain on production but business itself can be done only by a constant and unwilling repudiation of a part of it, that is, by failure, by bankruptcy. Only by continually wiping off a part of the indebtedness is it possible for business to "carry on." A study of a compound interest table will show that but for this periodical cancellation of a part of the debts owing, it would be possible for the credit class long since to have swallowed up all the wealth of the country. As it is, they have a lien on one-half of it, with none of the responsibility or care or worry or labor to make it productive.

Shall we deal with causes or with effects? Is not interest the mother of debt, not her daughter? Will the advocates of cancellation tell us when they propose to cancel the new debts which will inevitably follow if interest is left uncurbed—also the huge mass of private debts which strangle business with a cobra grasp?

Cancellation cannot be a permanent remedy because it blots out only a certain part of the present indebtedness from which the world suffers. Even if all debts, public and private, were repudiated, it would help only until the interest-taker begins accumulating his toll and in 10 or 15 years we would be back to "the miserable oscillation between usury and bankruptcy."

Where Irony Kills the American Spread-eagle

Gridiron Club Banter Is Always Music to the Statesmen's Ears; President Only Man in Public Eye Free From Impersonation

By AARON HARDY ULM

IMAGINE a young United States Senator, famous as a "boy orator" and noted for long speeches, attending his first banquet in Washington. The toastmaster in presenting him as a speaker reminds him that long addresses are wearisome and should be avoided.

"So that we might be of help to you," the toastmaster concludes, "we have decided to present you with this alarm clock. Before making a speech in the Senate, wind up the alarm, set the clock on your desk and when the alarm goes off, stop."

The Senator, primed for a display of his eloquence, responds. Just as he rises to lofty flights, the clock sitting before him breaks into loud, jangling sound, which continues for several moments. Amid the roar of laughter which goes up, the Senator, recognizing the satire, sits down and makes no further attempt to "wax eloquent."

In ways like that the Gridiron Club, of Washington, frequently reminds public men that they can take themselves too seriously, and it incidentally reminds the public that many matters of seemingly ponderous import may not be so serious as they seem.

Twice a year and occasionally three times a year the most famous dining club in America, if not the world, turns its fonts of humor and satire on men prominent in national life and on current national questions.

Whole Country Can Smile

ALL the country shares in part the fun produced at the famous dinners of the Gridiron Club, for no Sunday morning newspaper ever omits the description of its stunts, which alone is all that is ever permitted to be published regarding its dinners. The club has only one fixed rule, which is that "ladies are always present and reporters are never present." Each is a "constructive" fact, for the club is composed essentially of reporters and only once has a woman been invited to and attended one of its regular dinners. The woman thus honored was Miss Jeannette Rankin, who, when serving as the first woman member of Congress, was among the guests at a Gridiron affair.

While the Gridiron Club serves a good national purpose by way of satirizing men who sometimes take themselves too seriously and current questions which the public frequently takes too seriously, it is really an organization without a purpose. It has no high-sounding code of principles and has never attempted to speak for any group, not even for the corps of Washington correspondents, from which its members came and come. Though only men who are doing newspaper work in Washington are admitted to active membership, to leave newspaper work or move from Washington does not disqualify a member for further participation in club affairs. In fact, many of the active members are no longer newspaper men, and there is a substantial list of associate members, or former active members, who no longer reside at the national capital. Then there are 10 limited members who have no journalistic claim, but each of whom has some special entertaining talent, usually, as in the case, say, of John Philip Sousa, in the musical line.

The club is now in its thirty-seventh year, having been formed in 1885. Of its charter members only four survive and no one of them is at present a Washington correspondent.

Club Product of Friction

THE famous dining club, whose dinner invitations are more highly prized even by men of the greatest prominence than perhaps those of any other organization in America, was the product of friction between newspaper correspondents and some of the public men of the time in Washington. Back in the days when the status of the Washington correspondent was vague and undecided, a public man resenting criticism or the publication of matter he didn't like to see in print sometimes would try to "punish" individual correspondents or the corps as a group. In the early eighties two correspondents were ordered to jail by the United States Senate for refusing to make known how a copy of a treaty, under secret discussion, was procured for publication. Another time a speaker of the House of Representatives insisted on the right to "pack" the press gallery with curious and casual visitors, to the discomfort and at times the exclusion of the working reporters. Such occurrences forced the correspondents into self-defensive co-operation. They raised a furor that caused the two who were in jail to be released. They formed themselves into squads which guarded the entrances to the House press gallery and turned back casual visitors who demanded admittance by authority of the Speaker. In planning their defensive battles, they often met together at dinner, where they soon learned that ridicule and satire were of more avail than formal protest or solemn assertation. Out of those meetings grew the Gridiron Club, which from its beginning has been only a dining and fun-making organization.

In the early days the membership was limited to a maximum of 40, but even at that it was difficult to keep the club fully membered; for Washington correspondents were not so numerous as at present and some would not participate. Now the active membership is limited to 50 and to be invited to join the club is among the highest honors within his profession which a Washington correspondent can attain.

Neither well-planned fun-making as a dinner feature nor the particular kind that has made the Gridiron Club world-famous was an "invention" of members of the organization. The Clover Club, of Philadelphia, antedated the Gridiron as a fun-making dining club, and the Gridiron's peculiar variety of skits was originated by an outsider. At a dinner given the club in its early days by R. F. Crowell, the first rehearsed, stage-like stunts were enacted, most of them being satires on the club members. The club took over the idea and applied it in the main to public men and public affairs. For the last 30 years or more each of its formal dinners, one usually in early winter and the last in late winter or early spring, has been planned like a show for theater performance. All the skits have been written or otherwise devised by club members, who also with one or two exceptions have been the sole performers. The only outside assistance called in has to do chiefly with the costuming.

Every President since Cleveland has been the subject of Gridiron banter and every one since Cleveland has been a guest of the club. President Cleveland would never attend a Gridiron dinner and he was inclined to resent some of the satiric strictures applied to his policies at club dinners.

Harrison was the first President to attend a Gridiron dinner, and on the occasion in question he surprised the organization by showing that he could meet its members on their own ground. After subjecting him to the usual amount of badinage, he was called on to speak. It happened that only a few days before he had addressed a convention of patent lawyers and inventors.

"This is the second time this week," he remarked as he rose, "that I have been called on to open a congress of American inventors." His speech was one of the best ever delivered at a Gridiron dinner. After he concluded a member went over to Perry S. Heath, who was Harrison's confidential correspondent, and declared: "I didn't know it was in him." "Oh, he's all right on his feet," Heath replied. "It's only when he sits down that he falls down."

When Bryan Met Bryan

THAT was in 1892. Theodore Roosevelt, as Civil Service Commissioner, attended his first Gridiron dinner in 1890 and fittingly, it would seem, was the subject of a skit on that occasion. He made a witty speech, and the impression he made may have had much to do with his future. Of all men Roosevelt has been the source to date of most Gridiron "copy." His career and activities were such that for more than a quarter of a century there was scarcely a Gridiron dinner at which he could be ignored. It was Roosevelt who in 1908 helped to produce one of the few unplanned Gridiron sensations which, despite the rule against quoting speakers, got into the news. It was at the time of the controversy over his summary action with regard to the Negro troopers involved in the Brownsville riots. A clever skit had to do with the Brownsville affair. Senator Joseph B. Foraker, who was the guest of the club and a speaker at the dinner, took occasion to make an attack on Roosevelt, who, when his turn to speak came, made a counter-attack on Foraker. However, no full report of what either said has ever been published, though the newspapers of the day carried accounts of the verbal encounter.

Once or twice full speeches made by guests at Gridiron dinners have appeared in the newspapers. Once, about 1896, when Cardinal Satolli was new in Washington as the first representative there of the Pope, he was induced to attend a Gridiron dinner, and he agreed to make a speech. After a few remarks he asked that an associate be permitted to read an address he had prepared for the occasion. In it he set forth at length the reason for his being in Washington, something on which the correspondents long had been urging him to express himself. When the secretary of the club asked for a copy of the speech for permanent record, he was informed that it had been given out in advance through a press association. There was nothing else to do but to make it available to all correspondents.

At one of the few dinners given by the club during our active participation in the World War a speech made by President Wilson was released for publication several days after its delivery on account of the national importance of what he had said.

Wilson, while at the White House, was a frequent subject of Gridiron satire and often was present when skits having to do with his policies were enacted. He took the badinage in all good nature.

William Jennings Bryan, who for actual time in national office has been the subject of more Gridiron fun-making than any other American public man, always takes good-naturedly the grilling applied to him and sometimes contributes a pre-arranged part.

Once when he was Secretary of State it was announced beforehand that on account of a prior engagement Bryan couldn't attend one of the dinners to which he had been invited. But when the dinner began there was seen sitting on the left of the presiding officer a person who looked entirely like Bryan.

Later in the evening the real Bryan came in.

"I am tired of this man Hanford (the actor who on prior occasions had taken part in skits as 'Bryan') impersonating me," the Secretary of State exclaimed.

"I've tried to impersonate all the great actors of the time," Hanford replied, "and I certainly can't ignore you."

Hanna was among the most popular of all the more or less regular guests the Gridiron Club has had at its dinners. When he first appeared at one, he had just come into national prominence and was made the subject of a satiric skit. When he arose to speak, he said:

"I know many members of the Gridiron Club. I have met most of you on the tented fields—and in the barrooms of New York."

There is nothing that a guest can do at a Gridiron Club which will hit so well as to hand its members a "come back" with punch in it, and there is little that sets so badly as fulsome talk about the power of the press, the importance of the *Fourth Estate* and other pointless flattery.

President Never Caricatured

OFTEN a man of national aspiration but not well known nationally can render himself a tremendous service by demonstrating at a Gridiron Club dinner that he has "the goods." Though no report of what they say is made, it has often happened that such a man has earned the serious attention of the newspaper world by such a demonstration. This was so very largely with John A. Johnson, the popular Democratic governor of Minnesota, who in 1908 aspired to a presidential nomination. At a Gridiron dinner he made a surprising speech, filled with rich humor and sound philosophy—it is said by some members to have been the finest surprise among many that have occurred at the dinners. But for his untimely death Johnson might have become President and the unquoted speech might have been of great help to him.

While many men as Gridiron guests have displayed talents of which they were not suspected, the reverse of a pleasing surprise occasionally has occurred. Sometimes a speaker has ignored the five-minute rule, which applies to all except the President of the United States, and given forth laborious addresses that were wholly unsuited to the occasion. The President also is never impersonated, and is the only American public man who is thus held to be above direct and personal caricature. His policies and current expressions, however, are held always to be fit subjects of satire.

The United States Supreme Court is the single American politico-public institution that is never satirized, though some of its decisions have been made subjects of humorous quips figuring in club humor. In recent years few members of the Supreme Court have attended Gridiron dinners. The reason is believed to be the sense of judicial dignity that was held by the late Chief Justice White. He would never attend one of the affairs, for the reason, he said, that someone might take advantage of the occasion to attack the Supreme Court. "Then I would have to reply," he said, "and that would never do."

Two Most Notable Gatherings

THE reason why speakers at Gridiron dinners are held strictly to the time limit is because the programs are so minutely planned that if an event overlaps its allotted time the schedule of the evening is disarranged. So that the situation can be met when disarrangement is unavoidable, the president of the club, who always presides at the dinners, has despotic authority over both the preparation and the enactment of the program.

The two most notable dinners that have been given by the Gridiron Club occurred in 1898 at the close of the Spanish-American War and last year at the opening of the Limitation of Armament Conference. At the first dinner the greatest number of men of national prominence was present; at the last the greatest number of world prominence. The 1921 dinner was given largely for the distinguished delegates from abroad to the Limitation of Armament Conference and by reason of their presence it was one of the most notable gatherings of the kind ever held anywhere.

While it has many imitators there is no other club in all the world like the dining organization maintained by Washington correspondents. It may be doubted if another of the kind is possible anywhere. One could not operate very well elsewhere in the United States, not for the lack of talent, but because of the absence of background. It is the atmosphere of Washington and the immediate contact there with national figures and big national questions which make possible the high success of and the national interest in Gridiron affairs.

The affairs serve to show that things political are not always so serious as they seem; and if you will read a review of them—as set forth, say, in Arthur Wallace Dunn's interesting book, "Gridiron Nights" (to which the writer of this is indebted for much of the material in this article)—you will be inclined to wonder why some of the "serious" subjects satirized in the past were ever thought by anyone to be serious at all. Through the application of the philosophy of humor the club merely anticipates the mellowing influence of Time.

Teaches 300,000 Persons How to Swim

Aquatic Classes Replace Old System; Australian Crawl Kills Breast Stroke

By GEORGE H. CORSAN

Instructor of Swimming, University of Toronto;
Instructor of Swimming, International Committee, Y. M. C. A.

Massed class in preparation for the leg-drive action of the crawl stroke.

I HAVE taught more than 300,000 men, women and children to swim, in more than 200 cities and towns in North America. These persons have often asked me how I evolved my method of teaching and method of swimming. Today I find that everyone wants to know how really to learn to swim, not merely to go to learn to swim, which is something quite different. Briefly, what I have done in swimming is to put the old breast stroke out of business, and to invent the mass system of teaching, so that all may learn to swim. How I did these two things is this story.

Let me relate an incident that will illustrate how the right system is of immense importance in the art of swimming. One Sunday in August, 1917, at Fort Ticonderoga, motor vehicles were scarce, and I had to foot it. I had walked about five miles, when I saw a farmer approaching. I stopped him, threw my suit cases into his rig and climbed in. We had gone about two and a half miles when the farmer pointed across Lake George to a rock.

"Last Thursday night, late," he said, "with several other farmers I was passing along this road and we heard terrible shrieks and cries of a woman coming across the lake from that point. None of us could swim. We had no boat. The next morning we learned that a young woman, a Y. W. C. A. swimming instructress, had been drowned by a man with whom she had gone out in a canoe. He was not captured.

"That poor girl did nine-tenths of the drowning herself and he did the other tenth," I told the man. "He shoved her while her lungs were empty. Now, if that girl had known the art of swimming thoroughly she would have gulped in a huge breath of air, shut her mouth, and then permitted him to shove her under. While under, she should have let the air out to fortify herself against his next attack. To do this, she would have to appear at the surface. Her lungs being empty, in the fraction of a second she could have taken in a new supply of air through the mouth far more quickly than he could possibly have ducked her again. Now, for her defensive tactics against him; she should have drawn her feet up so that her knees would be about at her chin. There isn't a man in the world who is strong enough to overcome the powerful kick of a woman's two feet placed against his chin, neck, chest or abdomen. She would have been enabled to hit him a terrible blow, knocking him out completely, or, at any rate, making him exceedingly respectful toward her strength." From this incident we may readily understand how very important it is thoroughly to understand the right system of the art of swimming.

Swimming is the only sport in which woman can not only hold her own with man, but, on the average whole, surpass him. Her buoyancy is greater than man's. A man's specific gravity handicaps him considerably in his contest with woman in general all-round swimming.

I do not understand how any one can kill himself by drowning. I cannot imagine any one dying by drowning. Persons do so, but it is impossible to visualize. It is unnecessary, and an abuse of great happiness, pleasure, and the human mastery of one of the elements. Imagine being afraid of water! Imagine being a well, strong man, and being afraid of it!

In the summer of 1898 I had forcibly drawn to my attention, time and again, from statements in newspapers, that the more people knew about swimming, the more apt they were to be drowned, the more danger there was.

The next summer I joined the Toronto Swimming Club. During that summer I made a thorough study of swimming from all points. But I must say, I never learned a single point from books on swimming, and only two points from swimming instructors; the rest came from the study of my pupils and from the study of anatomy and mechanics.

In October, of that year, I joined the Y.M.C.A. in Toronto, to continue in its swimming pool the studies that I had taken up. Since that day I have been an active member of the association. Now, it so happened that about the same time J. H. Crocker came to the association as physical director. He was perhaps the greatest physical director Canada ever knew. He switched me in as a leader in the physical department, selecting as my particular field the teaching of swimming. The work was purely a hobby with me, carried on nights, with a view to finding out what was the matter with the art of swimming that so many so-called good swimmers were drowned.

As I looked at my class the thought occurred to me: Why not discard this old Swedish and English system of teaching one pupil at a time, suspended out in the water by means of rope, pulley and belt? Why not teach them on an entirely different system? So I had the class get in the water, all standing up, then all doing the same thing together: first, to learn to breathe beneath the surface of the water; second, to learn to open their eyes beneath the surface; third, to do the dead man's float; fourth, to drift across the pool from a shove off, all together; fifth, to learn the scissors kick together; sixth, to learn the crawl kick together, both on front and on back. The Australian crawl stroke had just appeared and gave an entirely new value to swimming as a movement of beauty and speed.

Then and there, I discarded entirely and forever, the old breast stroke, inefficient, awkward and unnatural.

For three winters I taught swimming for the Athletic Association of the University of Toronto and then took up the work in the United States. In the early days my determination to have the mass system supplant the old-style methods caused fights and controversies in large cities. In Cleveland, they received my system with open arms while in Pittsburgh they fought it and I had to force it on them with contests and combats I had in the water.

I traveled through many cities, from San Diego to Miami, from San Francisco to Portland, Maine. In many of the cities, the Y. M. C. A. advertised that I would pull a strong swimmer out of the water against his will. This feat I performed again and again. The crowds considered it an extraordinary feat. But I considered it merely a demonstration of the fact that nobody knew anything about the art of swimming and, especially, about its basic principle, to breathe out beneath the surface of the water through the nose, and to breathe in above the surface through the mouth. I cannot recall a single instance where my opponent was not much stronger than I. But my sole object was to teach the mass of people that the basic principle of the art of swimming was rhythmic breathing.

To explain my feat: My opponents would always hold their breath during the terrific struggle we would have beneath the surface of the water, while I would always breathe, when I was beneath the surface, through the nose, in a steady stream, so that, when we arrived at the top, for the moment, my opponent would let the air out of his lungs, while I would draw in a new supply, and then we would both go down together, he with his lungs empty, I with my lungs full. Finding himself beneath the surface, without any air in his lungs, my opponent would always turn his back on me, to get away from me. This was my opportunity and I simply helped myself to a stranglehold from the rear; and I found him, without any exception, mighty glad to be pulled out of the water against his will. Sometimes the struggle would last five minutes, but very rarely. It was generally over in two minutes.

I always explained the trick at the finish of the exhibition, for my purpose, in going around, was to educate the people.

In the summer of 1908, John H. Scott, physical director of the Brooklyn Central Y. M. C. A., drew the attention of Dr. George J. Fisher, head of the physical department of the international committee of the Y. M. C. A., and of George D. Pratt, founder of the Pratt Institute, Brooklyn, to my work.

Mr. Pratt decided he would try my system in Brooklyn, during the month of July, that year. The test was that I was to teach every Sunday school boy in Brooklyn who could not swim, to swim, in one or the other of the six Y. M. C. A.'s which I was to visit each week, a different Y. M. C. A. each day for the four weeks of July. In this campaign I had not the slightest difficulty in teaching 2,200 boys.

This was considered my real start in demonstrating the mass system, and I used it extensively in my classes the following summer, when I was permanently employed by the international committee of the Y. M. C. A. to travel under its auspices. Many of the cities procured as many as 1,500 boys for me to teach in one week.

The following year, 1910, and afterward, I continued the work, but extended it much further; to the Y. W. C. A., city parks, playgrounds and many high schools.

The city of Cincinnati employed me to demonstrate the mass system in its public schools. Here I proved to the satisfaction of the authorities that shallow pools were far better than deep ones. In deep pools I could teach with great difficulty only 20 boys or girls at a time, while in the shallow pools I had no trouble in directing my mass swimming drills to classes of 100.

The United States Army and Navy engaged me during the summer of 1918 to teach at all the camps up and down the California coast. Many of my classes there consisted of 150 men. Some of these men were from Arizona and had never seen water deep enough to cover themselves and some came from Montana, where the water is so cold they had had no opportunities to learn to swim.

No matter how strong and powerful a man is when he comes into a class as an absolute beginner, he is in dreadful fear of the water. He must be treated with the utmost kindness.

I believe I have proved that a good swimmer cannot drown; that the old breast stroke is stupid; and swimming can be taught in mass. Now, I am starting a campaign to see that every man, woman and child in the United States and Canada learns to swim. Man lives in three elements—earth, air and water. It's strange that we have mastered the most difficult, the air, while many are yet unable to live in the water. An absurdity! Everyone must know how to swim.

Upper—Massed class learning right-handed scissors kick. The "scissors" is one of the main pillars of the art of swimming. Lower—Massed class learning the details of the crawl-arm action.

Strange Animal Mystifies South America

Creature May Link Past With Present

By Courtenay Savage

THERE is a black shadow in South America, a shadow that has startled the natives of Southern Patagonia, a black shadow which white men think they have seen by day, a shadow that has caused 30 years of rumor, and that may reach out from the past, linking the modern world with the days before the coming of man—days when strange beasts shook the earth as they went in search of food, beasts of sixty million years ago, when the animal life of this planet was passing through the age of reptiles.

For nearly 50 years there have been periodic reports from various portions of Patagonia, generally from the southern lake region territory near the Andes, that a monster unlike any ever visioned before had been seen, first in one place, then another, and each of these reports has described a creature of such proportions that the question has been raised in men's minds as to the possibility of the fact that a Plesiosaurus, a reptile believed to exist today only in fossil form, has survived the ages, and is still living in the almost inaccessible country of Southern Patagonia.

The Plesiosaurus was an amphibian monster, fossils of which have been found in various parts of the world. It was a marine reptile, living in the lakes, and along the shores, feeding on shellfish, and coming ashore only as do our seals of today, by pulling itself along with its large flippers.

These marine reptiles were very distantly related to our turtles, though in place of a shell they had a leathery hide. Their bodies were short, with two pairs of long powerful flippers. They had a short tail. The outstanding feature of the Plesiosaurus was the long flexible neck, joining a lizard-like head, armed with well-developed teeth. These reptiles were from 10 to 40 feet in length, and of two varieties, long and short necked.

The Plesiosaurus was what is termed a "bottom feeder," finding its food along the bottom of the lake, generally shellfish. An interesting point is that whenever a fossil of a Plesiosaurus has been found, inside the body cavity of the skeleton has been discovered a pile of stones. These were swallowed by the Plesiosaurus as aids to digestion, just as some of our modern birds swallow stones for the same purpose.

(C) American Museum of Natural History

Long-necked American type of Plesiosaurus, from a painting by Charles R. Knight. It is a marine reptile of this type that is reported to have been seen in the lake region of Southern Patagonia. If such a creature exists it is possibly a descendant of the Plesiosaurus that lived approximately sixty million years ago. The painting is suggested from fossils of the Plesiosaurus.

The latest report that might lead to the belief that a reptile of Plesiosauric proportions might be living today in the Patagonian wilderness was recently sent to Professor Onelli, director of the Buenos Aires Zoological Gardens, by Martin Sheffield, an American hunter and prospector, who, while traveling through the territory of Chubut, saw along the edge of a lake animal tracks that had beaten down the vegetation, and which were apparently made by a creature of huge proportions. A little later, far out on the lake, Mr. Sheffield saw a creature with a colossal neck, and swimming in such a way as to make it seem that the portion of the body under water was huge, and shaped like a turtle or a crocodile.

What was it? There is no animal of similar proportions known to exist in South America. Was it an illusion? Another "sea serpent" story? Professor Onelli thinks not. Mr. Sheffield is his friend, and, besides, there are years of rumors to substantiate what the American prospector had seen.

It is nearly 30 years ago since the night Professor Onelli, camping in the very region from where Mr. Sheffield's report was sent, listened to the frightened stories of the natives, who said that they had heard strange noises along the lake front, and that, growing venturesome, several of them had gone to investigate. What they had seen was a black shadow swimming away in the moonlight—a huge shadow, far greater than that caused by any man or beast they had seen before, a shadow with a neck that craned in their direction, and then disappeared. No; they had never heard the rumbling noise on the shore during the daytime, only at night. Yes; the animal was many feet long—with a very long neck. More than that they could not tell, but Professor Onelli was so impressed with the story that an expedition was formed to hunt for the original of that shadow, but nothing was ever found to explain the mystery.

There have been other reports since that time—other happenings that would point to the possibility that the lake region of the Southern Andes harbored a beast unlike any known to man. In 1898 a Norwegian scientist reported having found huge footprints along a river bed, but that further search had brought out no further traces of an animal of ungainly proportions. Later the natives of another portion of that territory were sent into a state of terror because they had seen and heard a huge animal. Was it the same "black shadow" of which Professor Onelli had heard? Then in 1913 an Englishman, seeking adventure at the far-away places of the earth, reported that he had seen a water beast with a neck much longer than the neck of most animals. He was the first white man to have seen the beast, and his report is very similar to the 1922 report from Martin Sheffield.

If there is one such animal alive, there are undoubtedly two or more, is Professor Onelli's belief, and under his supervision an expedition will search the neighborhood of the latest report. However, neither the report nor the expedition, should be misconstrued to make it seem that Professor Onelli, or any other man of science, believes that the strange marine animal, with a neck of almost snake-like proportions, has lived ever since the days of the Plesiosaurus, but it is possible that the creature is a descendant of the Plesiosaurus that lived in the age of reptiles, not so large as the ancient monster, but still of tremendous proportions.

If there is such a member of the animal kingdom in existence, South America, especially the lake region near the Andes, would be an ideal place for it to thrive unmolested, for the country is almost untouched by man, and many wonderful fossils have been discovered, showing that that portion of the earth was inhabited by ancient beasts, and primitive men.

It was in a cave on the Last Hope Inlet, off the Straits of Magellan, that the famous Nordenskjold Expedition found in a perfect state of preservation the skeletons of giant ground sloths, and with the skeletons were pieces of dried flesh, skin, and perfectly preserved spoor. It was a remarkable find, and rumor went forth that the animals had not been dead very long, especially when a further search disclosed the fact that there were artificially cut bundles of dried grass in the cave. Scientists, however, quickly discredited these rumors, pointing out the fact that the remarkable state of preservation was due to the fact that the cave was so situated that the air was absolutely dry, and acted as a natural preservative. The discovery of the contents of the cave at Last Hope Inlet confirmed to science the fact that the big mammals of the past had not disappeared from earth before the coming of man. Evidently the natives of that region had caged up the giant sloths (these beasts were large enough to balance themselves on their hind quarters and eat the top off a small tree) and fed them artificially; therefore, they must have used them, either as beasts of burden, for food, milk—one way or another.

However, the giant sloths lived long after the age of reptiles in which the Plesiosaurus lived. Man, according to all scientific calculations, has not been on earth more than a million years, and he came just at the end of the age of mammals, while the Plesiosaurus lived approximately sixty million years ago.

In spite of all these years, however, in spite of the fact that the earth's surface has changed in that time, it is remotely possible that a marine monster directly resembling the ancient Plesiosaurus may be living in Patagonia. To the skeptical it might be pointed out that it is not many years ago that Sir Harry Johnson discovered the Okapi, a deer-like animal from the rain forests of the Belgian Congo, and that while he was able to trap the Okapi, and so examine its general appearance, no white man has ever seen the Okapi alive.

James Oliver Curwood Finds the Soul of Nature

Concluded from page 7

self. I named him Thor, and I began to watch my opportunity to kill him. At the end of the first two weeks, I believe he felt that I was not going to harm him. Then I got a shot and put a bullet through his shoulder. After that it was a game between the cunning and trickery of two men's brains and a brute's instincts. I got two more shots on two different days and hit him both times. The third time I was surprised that Thor did not face the battle and charge. And then, almost a week later, the thing happened. I had climbed the steep side of a mountain to get a look over the valley with my hunting glasses, and rested my gun against a rock. Then I went 40 or 50 feet farther on, following a narrow ledge, until I found myself in a little pocket, with a sheer wall of the mountain at my back, and a 100-foot precipice below me. Here I sat down and began to scan the valley. Perhaps 15 minutes had passed when I heard a sound that stopped every drop of blood in my body—the click, click, click of clawed feet coming along the ledge. With my rifle 50 feet away, and no escape up or down, I sat petrified. And then along the ledge came Thor!

The Turning Point for Curwood

"HE STOPPED squarely in front of me, not more than six feet away, and turned his great head toward me, swinging it slowly from side to side. His jaws were open a little, and they were drooling. His eyes were small and shone with a dull red fire. In that moment I was certain that my end had come, for the big grizzly had smelled me many times, he had seen me and had felt the sting of my bullets, and vengeance was rightly his. He looked at me. And now I saw there was no anger in that look. In those terrible moments my heart went out to that great, lonely brute. For perhaps two minutes the grizzly stood there, and then he went away, leaving me unharmed! And yet he knew that I was hunting him, that I had shot him, that I was his enemy! I was weak when I got on my legs again.

"From that hour something new was born in me; a new world opened up for me, and in all my adventurings since then that world and its possibilities have grown steadily more wonderful. I have learned the truth of the Biblical prophecy. It is not wild life that is at war with man, but man that is at war with wild life. In the heart of the wild creature, waiting to be fanned into life, is a love for man."

Comfortable in his city home, with all of the conveniences of modern living, with a wife, two daughters and a son, I wondered how many miles this man had gone in search of nature. To gather the information for "The River's End," he traveled 3,000 miles up and down the Saskatchewan. Then he told me that perhaps his love of nature might have come by heredity "inasmuch as my grandmother was a full-blooded Indian." On his father's side he is a descendant of Captain Frederick Marryat, the distinguished British novelist who visited the West and Canada in 1837.

Sometimes when writing in Owosso, he deserts his own home and back at his mother's is a room furnished with a stove, a chair, a sewing machine stand for a table and a typewriter. Here he can work. Most of the shacks where he has written his novels of the North have been built by his own hand, while his wife fished in the brook for food for the meals.

How His Life Has Been Spent

MR. CURWOOD is 42 years old, as lithe as an athlete and interested in everything. For seven years he served as a newspaper editor. Perhaps that accounts for his deep interest in local, civic and national problems. Born in Owosso, Michigan, in 1879, Mr. Curwood still insists that his real birth was only 10 years ago, when he openly espoused his ideas of nature conservation.

"I am glad that the first years of my life as a man were spent in the crowded places," mused Mr. Curwood as he discussed the development of his doctrines about nature. "Without those years I would have only a one-sided view of what nature means to the fortunate ones who find it. Fate, in that way, has been kind to me. For I was born in a small city, and saw a circus, which I still remember, at the age of five. I did not see another until I was 14, for between the years of 6 and 14, I lived on a 40-acre stone quarry, which my father fondly believed was a farm when he bought it. But it was ideal for me, close to the shore of Lake Erie, and with big woods and swamps behind it. At the age of eight I had a gun and at the age of nine began writing my first thrilling pieces of fiction. Then—back to the little city where I was born, Owosso; my experience at school, the University of Michigan, and after that seven years of newspaper work.

"And then—God's country. And by God's country I do not mean the great North alone, though it is always into the North I go when I have many months to spare. All outdoors has become God's country to me now."

Ask Him—He'll Tell You All About Fish

By ROBERT H. MOULTON

IT IS a safe bet that the compiler of "Who's Who in America" is no fisherman, otherwise he would have printed in bold-faced letters the name of Dixie Carroll, Chicago, to which he would have added, in the same impressive type, the unique title of "Piscatorial Adviser Extraordinary."

That's exactly what Dixie is, and if you don't believe it, ask any one of several million disciples of Isaak Walton in these United States. You won't have far to search to find one, either. They are in Wall Street, under the Capitol dome at Washington, in the stockyards of Chicago, behind the counters of village stores, out on the western prairies—wherever, in fact, there is a man or boy, not forgetting the women folks, who has listened to the music of a humming reel. They will tell you that Dixie is not only some fisherman himself, but that he has the faculty of telling other people how to become the same in language that is at once entertaining and instructive. Best of all, he puts no price on the advice he offers; it is yours for the asking, provided you send along a stamp to cover his reply. This is important when it is considered that some months Dixie has received not less than 600 inquiries from perplexed fishermen.

Dixie Carroll, fisherman extraordinary.

Dixie initiating an embryo fisherman into the mysteries of camp fire building.

These inquiries have covered every subject from the right way to impale a worm on a hook, to the correct weight of a muskellunge 42 inches long and 16 inches in girth, that had been caught at 5 o'clock in the afternoon of the Fourth of July, in a Northern Wisconsin lake, but which couldn't be weighed because the lucky fisherman had no scales with him.

A little poser like that is easy for Dixie. He knows what that fish *should* have weighed, because he has in a neat little book the dimensions, fore and aft, round about, crisscross, up and down, and every other way, of a multitude of "muskies" of his own catching, and so it is easy enough for him to dope out the matter down to almost the fraction of an ounce.

In the same reliable manner he can advise you on any other subject that has to do with fish. Would the Wall Street banker switch temporarily from the pursuit of the elusive dollar to the still more elusive rainbow trout in the wilds of Canada? Immediately he writes to Dixie and presently receives in reply what is, in effect, a passport to the choicest fishing spots of the region he wishes to visit.

If the small boy writes in to ask whether grasshoppers or crickets are a better bait for trout, he receives from Dixie the same kind of "pal-to-pal" letter, not only giving him the desired information but a wealth of other suggestions, which are calculated to be of value in teaching the young idea how to angle successfully along the lines of true sportsmanship.

That is the charm of Dixie's style. He makes you feel that he has no other object in life than to help you catch that "big fellow" just below the rapids of your favorite stream, or to solve whatever angling problem confronts you. Fishing lore fairly oozes from him.

Dixie's earliest contact with deep water came when he was about seven years old. He and his father were fishing in the Chesapeake Bay, when their catboat was overturned, sending both father and son to a cold bath. Father swam ashore with the youngster on his back, and during the journey of several hundred feet son had the nerve to call father's attention to a school of fish sporting near by, remarking that if he only had a landing net he'd bet he could get one! After reaching shore and getting some of the water out of his lungs, father gently intimated that Dixie's forte was the fishing game and that he should devote his energies to it.

Up to the time he was 15 years old, Dixie tramped and scouted through the Blue Ridge and Allegheny Mountains with an uncle. Then the family sent him away to military school. After graduating there, Dixie joined the staff of a Baltimore paper as a cub reporter. He lasted three months. Then he went to Texas, and worked on a ranch for six months. Then he came North, where he hit New York's newspaper row and landed a reporter's job on one of the afternoon papers, being given the ship-news "run." Came springtime presently—and with it the wanderlust for Dixie. So he signed up for a two-year cruise around the world with Captain Evans, skipper of the iron schooner Loch Finlas. Officially, he was assistant steward, but it was understood that he would have nothing to do but hobnob with the captain.

It sounded fine to the reporter-sailor, but "Cap" Evans was a pinochle fiend, and Dixie soon discovered that his real job was to play two-handed pinochle with Evans every minute that the old skipper was off watch and not sleeping. After a week of this, Dixie began to plan mutiny. The Loch Finlas finally dropped anchor in the harbor of Para, Brazil. Dixie went ashore, hunted up the American consul and told the awful story of the pinochle games. The consul helped Dixie to disappear this way: He got Dixie a job with a French company about to go 1,800 miles up the Amazon River for orchard plants. Six months later Dixie was back at Para, and by giving $10 to the captain of a tramp steamer, obtained a passage to New York.

Off for a cruise in the woods.

Virtually, ever since that Dixie has been fishing, cruising through the woods and over water trails, and writing a wealth of stuff about angling and the out-of-doors. He has fished from Alaska to Lower California on the west coast, and from Newfoundland to Key West on the Atlantic side. He has hooked 'em out of all the important rivers and most of the lakes of any size in the United States and Canada.

It should not be understood that Dixie confines his attention entirely to fishing matters. While he probably has written more on fishing than any other writer, and reaches large audiences through his books and as editor of one of the leading outdoor magazines, he has a wholesome love for nature in general and believes in trying to instill a similar love in the breasts of the rising generation. He is never happier than when giving his nature talks to school children. With 100 or 200 youngsters of the high school and grammar grades grouped around him, he takes them into the woods, tells them the ways of animals, how they defend themselves against other animals which are their enemies, and at the same time instills in the minds of the children the importance of the conservation of wild life, an idea which he says we must all follow if we expect to have our wild animals with us in later years. Although each of his articles and his talks carries a lesson, they are presented in a style which sugar-coats the lessons and makes it mighty easy taking.

Viewing German Rhineland Under Many Flags

Concluded from page 2

buyers, and it was next to impossible to find an empty seat in the most expensive restaurants and cafés.

There were no files of ex-soldiers reduced to public charity as in London, nor the battered wrecks of humanity that haunt the byways of Paris. In three weeks' time I did not come across a single beggar. One man asked to carry my suit case, saying he had no money, but I doubted his words, noticing that his collar was of a more fashionable cut and his shoes better polished than my own. A few days later I read that a man answering his description had been arrested on a charge of robbing a tourist of his luggage.

Browsing about the bookshops I kept in mind the charge that the French were showing themselves short-sighted in keeping alive an anti-German propaganda at this late day. In the shops of Cologne I could not find a single book or picture by a Frenchman, and on two occasions I was told point-blank that the book I was seeking was not for sale at that time. The Cologne opera had dropped all the French works from its repertoire without exception. On the other hand, I had seen scores of German books in the Paris shops, many of them in the original. At the Paris opera one can hear Wagner and Beethoven and Mozart, to say nothing of the fact that at all the various concerts German music is given almost as much attention as before the war.

In a guidebook of Cologne, translated into very painful English, I discovered the seven monuments worthy of a tourist's attention. The list was interesting: Emperor William I, Empress Augusta, Emperor Frederick, Emperor William II, Emperor Frederick William III, Bismarck and Moltke. The philosophers and scientists and musicians who have spread German culture seemed sadly neglected. I found myself in the Schildergasse, a crowded artery in the busiest part of town. On one side rose a recently completed building, bright with fresh paint, and over the portal was the name "Hotel Hohenzollern." Directly opposite, a succession of limousines were rolling up to the doorway of a coffeehouse. Over this doorway, also freshly painted, a sign proclaimed it as the "Haus Hindenberg." The most striking feature of the lavishly decorated interior was a life-size likeness of the gentleman, in whose honor the establishment was named, attired in full military splendor with one hand grasping the hilt of a sword.

Over a cup of coffee, I listened to an excellent orchestra and watched the people about me, wondering how the war had affected their ideas. Between the faces of the old men and the young men I seemed to distinguish a difference, and I do not think it was wholly my imagination that led me to believe that there was stamped on the older generation something of resignation. The hard, arrogant faces were those of the young men who sat stiffly at the tables.

Aside from Coblenz with its baseball, its football, its easy American camaraderie, its vast income of American dollars, it is an unreconciled, apparently irreconcilable Rhineland.

"Scraps of Paper" That Litter Wall Street

Concluded from page 3

ate. It inserted a series of large advertisements in 3,257 city and country newspapers. Then it published an elaborate volume of 140 pages, in which it reproduced these advertisements and as many editorial comments favoring its arguments, which had been printed in the newspapers which had obtained its advertising. For efficiency in influencing public sentiment, this effort of Wall Street financiers stands unparalleled. It succeeded in defeating the Senate's bill.

A copy of the book which the company sent broadcast lies before me on the desk as I write. If the profits of all the best sellers, from the date when the sudden circulation of the "Woman in White" astounded the world, to and including those of the present day, were added together, they would probably shrink into insignificance when compared with the profits this bound volume made for its Wall Street sponsors.

The company's common stock sold at $30 a share in January, 1914. Two years later, in 1916, this stock had jumped on the New York Exchange, to $700 a share. That represented a profit of 2,333 per cent. Comments on its huge war profits made the company nervous. The financiers decided hurriedly to split up their "war baby." On the following February they issued $45,000,000 in new stock, most of which they gave away as a bonus to their common stockholders. The two different classes of common stocks promptly dropped to below par, and the enormous war profits were effectually concealed.

Many stocks in Wall Street are excellent investments; all are highly dangerous ones when held on margins; a large proportion are mere scraps of paper, worth less than the ticker tape on which their quotations are printed. The intending purchaser had better first memorize the ominous motto of the Street: *cavcat emptor,* Let the buyer beware.

Indian Temples Reproduced to House a College

University of New Mexico Preserves History by Reviving Ancient Structures

By HARRY H. DUNN

MOST universities, in this day of greatly increased demand for higher education, are content if they succeed in permanently perpetuating themselves to the benefit of future generations of their city, county, state or nation. Many of them, as especially the case in the West, where, as I have written before, the state university has taken the place of the older, more historic, and often less heavily attended, endowed institutions of learning in the East, are gradually limiting the scope of their endeavor to the education of the youth of their own state.

One of these western universities, however, hit on the original idea of perpetuating not only itself, but of preserving for all time an extremely valuable and important part of the history of its state, by reviving its ancient structures, by reconstructing scenes from its historic past and by handing on to future generations correct reproductions of buildings, even whole towns, which have figured largely in the past story of that state. The only university which has done this is the University of New Mexico, which is today housed in probably the most unusual, certainly the most striking, and doubtless the most interesting, buildings occupied by any college or university in either of the Americas. To preserve, in so far as possible, the most important of the monuments of early man in the peculiarly interesting desert mountains of New Mexico, and probably the most mysterious of all the structures of primitive man in the entire Southwest, the University of New Mexico is filling its campus with reproductions of the communal temples and houses of the Pueblo Indians—the Moki, Hopi, Havasupai and other tribes, which were well-organized and comparatively well-housed long before the landing of Columbus in the Antilles, and probably before the Norsemen discovered what is now North America.

These buildings are reconstructed with the closest fidelity to detail, the only deviation from the original plans of the Indian builders being the substitution of interior stairways for the ladders by which the Moki or Hopi moved upward or downward from story to story of his communal dwelling. Standing at the southwest corner of the campus at Albuquerque, for example, is the administration hall, the oldest building on the campus, remodeled in 1901 to conform to the Pueblo Indian style of architecture, at the same time that the dormitories for men and women were erected on the same plan. The introduction of this type of building—the first time within the writer's knowledge in which the architecture of the American Indians has been drawn on for the buildings of the white man—was due to the creative imagination of William G. Tight, formerly a geologist from Denison College, who was president of the University of New Mexico from 1901 to 1909. Since the origination of this plan by President Tight, it has been carried on by succeeding presidents and boards of regents, until, some day, the entire 300-acre campus of the university will be converted into a completely restored town of the Pueblo Indians, which will endure long after the original mud and clay structures of these Indians have crumbled to dust.

The university stands on an elevated plateau, about a mile east of Albuquerque, at an elevation of 5,000 feet above the sea, and overlooking the historic Rio Grande del Norte, called, for part of its length at least, the Rio Bravo del Norte, by the adventurous Spaniards of the sixteenth century. On this plateau, or mesa, rise the 14 buildings of the university, created by act of the legislative assembly in 1889. What would have been insurmountable obstacles to any other than the hardy souls who wrought a state out of the mountains and deserts of that arid land encumbered the pathway of early education in the territory, which was acquired from Mexico, it will be remembered, by the treaty of Guadalupe Hidalgo, on February 2, 1848, and held under military control until the first territorial legislature assembled in 1850.

Though created in 1889, the University of New Mexico was not actually opened to students until September 21, 1892, less than 30 years ago. Today, it is free from all debt, an accomplishment of the past two years, under the direction of Dr. David Spence Hill, its president, in which time also three new buildings have been erected and a large athletic field and grandstands built. Between 1920 and 1921, the student body increased 15 per cent, notwithstanding the fact that tuition fees for students coming from outside New Mexico are four times those of resident students within the state. This increase in fees for "foreign" students is in line with the practice recently adopted by virtually all western state universities, and one of its results is to compel each state to provide the best of facilities for higher education within its own borders.

"The State University of New Mexico during the past two years has undergone a complete reorganization, including a new faculty and a new president," said Dr. Hill to me a few days ago. "Not the least important of the steps taken is the elimination of the preparatory student, so that now the university is of standard college grade throughout, and receives no students below that grade. The university is the culmination of the educational system of the state, and is as closely connected with the high schools as they, in turn, are united with the graded schools throughout New Mexico. The relation between the state university and the high schools is much the same as that between the high schools and the graded schools, in that graduates of the high schools may enter the university on their certificates of graduation, an effort to make the passage from high school to university as easy and natural as that from the graded school into the high school. This is a feature not always closely considered by the state university, but careful application of it, we believe, results in a larger percentage of high school graduates going on to the university, than under conditions in which certain limitations surround their entry into the higher institution.

DR. DAVID SPENCE HILL,

President of the University of New Mexico.

"Training for leadership in true American citizenship, as well as in the arts, sciences and professions, is constantly kept in view. Especial attention is paid to preparing our students for work especially needed, or for which there is a wide field in the state of which this university is a part. The university encourages scholarships and learning, and the application of scientific knowledge to the arts of everyday life. Its aim is to place all its resources, with the least possible restriction, at the disposal of any person who desires and who has the qualifications to use them. The university is supported by the income from the proceeds of the sale of lands granted to it by the Federal Government when New Mexico became a state, combined with the income from leases and other uses of lands. Its chief support, however, is that of appropriations made for its maintenance by the state legislature. Considerable donations of funds, books and equipment have been made by the many friends of the institution, and a number of its graduates scattered throughout the world, but especially within the state of New Mexico. The university's position as to religion is strictly non-sectarian.

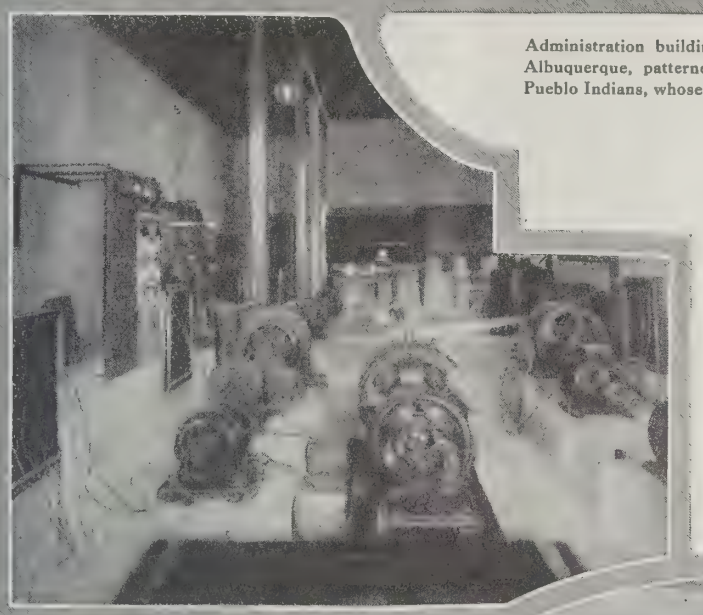
"A larger measure of self-government is granted to and expected from the students than in most universities, under a students' constitution, authorized by the board of regents, which is the controlling body for the university. The students form an organization called 'The Associated Students of the State University of New Mexico,' which controls the other student associations and organizations of general interest. It is firmly impressed on every student that enrollment in the university does not relieve him, or her, of any single one of the duties and responsibilities of good citizenship. Class distinction is frowned on by the board of regents and the faculty, and will not be tolerated.

"The business administration of the university is conducted strictly on a budget system, a rather unusual feature in state universities, and the president is the executive manager of the entire institution."

Interesting figures regarding enrollment were presented by Dr. Hill, who showed that, of the 241 students enrolled, 136 are men and 105, women, of whom 57 were born in New Mexico, 22 in Kansas, 16 in Texas, 13 in Illinois, 10 each in Arkansas, Oklahoma and Tennessee; nine in Missouri, eight in Ohio, seven in Indiana, and so on, 38 states being represented on the roll, with one student from Porto Rico, and one from Syria. About 40 institutions of higher education are represented, including 10 state universities, rather a high percentage for a university of the size of that of New Mexico, in a state so sparsely populated as is this one. Twenty-five counties in New Mexico have representatives in the university, and 26 secondary schools of the same state have graduates enrolled there.

In common with other western state universities, that of New Mexico has been wrestling with the problem of the cost of living for the students. Tuition has been reduced to what would be considered at most universities a very low figure, the registration fee being $3 a semester; the tuition to resident students, $5 a semester, and to non-resident students, $20; the student activities fee, $5, and the guaranty deposit $10. A minimum seems very nearly to have been reached in the costs of board and lodging. In the residential halls for men and women, on the campus, in connection with the dining hall, board and lodging are furnished for $27.50 a month. This means that the student, either boy or girl, can have comfortable rooms and board for less than $1 a day, but they must furnish their bedding, towels and similar equipment.

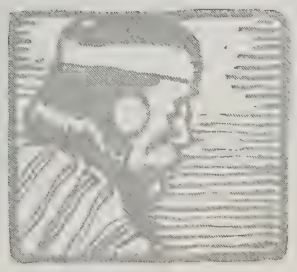
"It is the intention of the board of regents," said Dr. Hill, "to furnish good board and lodging at cost, and to assist, as much as possible, in the obtaining of employment by students who need such assistance to carry them through the university. A marked degree of success has been attained in both efforts."



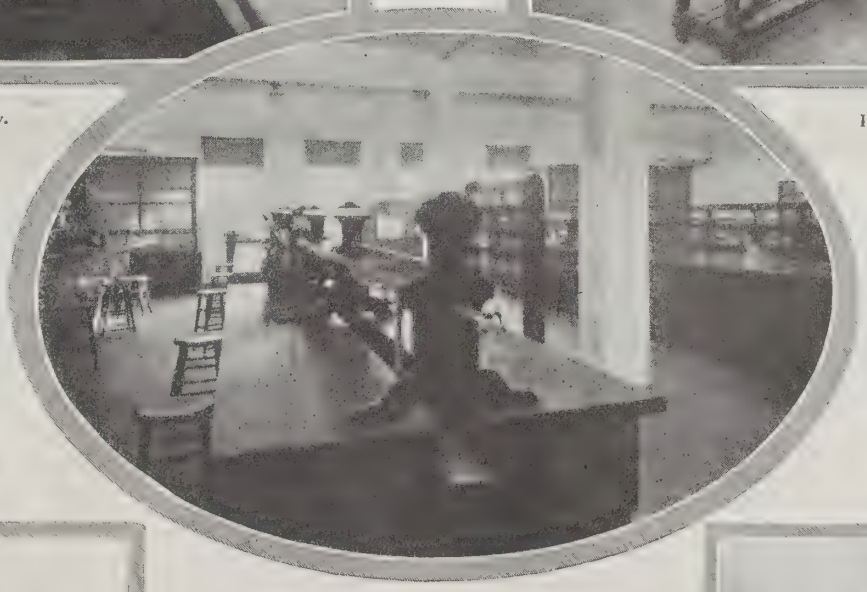
Aside from the 241 students enrolled as mentioned, there are more than 300 others in the various colleges, and extension departments of the university, bringing the total of students up to approximately 550. The extension department is of especial interest, since it, similar to the same departments in the universities of Arizona and Nevada, is carrying a liberal portion of university training to every home in its state. There are 278 students in the extension department alone, of whom it is interesting to note that 95 are studying applied psychology; 24, archeology; 72, educational measurements; nine, home economics; two, journalism; 13, salesmanship, and 63, Spanish. A large number of students in the University of New Mexico make Spanish their major study, due to the bilingual character of the larger part of the population of the state.

The extension division is on a virtually self-supporting basis, and is reaching a larger constituency in this manner than through regular classroom channels, though no appropriation has been made for this work, which consists of lecture courses, classes and correspondence, open to qualified adults on the payment of small fees. Thus, though the University of New Mexico is a young institution—as universities go—being less than 30 years old, it has made higher education general in distribution through the state which it serves; lower in cost than it is in many more populous and more wealthy states, and, in its housing, has preserved forever the architecture of an important but vanishing people.

Quaint Buildings Shelter Modern University



Administration building of the University of New Mexico, at Albuquerque, patterned after the communal houses of the Pueblo Indians, whose remarkable towns still stand in numbers in New Mexico.



Electrical engineering laboratory.

BRIEFLY TOLD

One of the greatest electrical supply companies in the world has fifteen million dollars' worth of unfilled wireless apparatus orders on its books and refuses to accept more business till it catches up.

A decree restricting emigration of Mexican laborers to the United States has been signed by President Obregon. A great number of Mexicans have been thrown out of employment in this country and have been repatriated at the Mexican Government's expense.

Knut Hamsun, the Norwegian novelist, Nobel Prize winner, invested most of the Nobel Prize in blooded stock and in improving his farm in Norway. Theodore Roosevelt, winner of the prize in 1906, gave his $40,000 to the Foundation for Promoting Industrial Peace.

What is believed to be the oldest golf club in the world was founded in 1608 by James I of England and is still in use today at Blackheath, Scotland, the home of the Royal Blackheath Club. Many historic treasures are to be found in the clubhouse, among which are a set of clubs 200 years old.

Milk from the soya bean is now being made in Vienna at one-sixth the cost of fresh milk. It closely resembles cow's milk in proteid, carbohydrate and fat content, and in color. Cheese and butter can also be made from the soya bean and a flour, one part of which equals in nutritive value two parts of meat and one-third part of wheat flour.

Vanua Lava, an island in the New Hebrides, is literally a mountain of sulphur, 1,600 feet in height and about 100 square miles in base. The mountain is 99 per cent pure sulphur.

One hundred million dollars a year is spent by the people of the United States for buttons made in this country. Besides this $16,000,000 worth were sold abroad since the beginning of the war.

A sudden shifting of the winds piled up all of the smoke of Chicago in one monstrous cloud blanket, through which not even a sunbeam could force its way, recently, leaving the city in darkness at noon. This lasted but a few minutes.

Musical men make the best oarsmen says the Princeton University coach, who states that his best stroke oars have been glee club men.

A jet deposit, believed to be the first one to be developed in the United States, is now being successfully mined in Utah where the largest known commercial body of the mineral in the world is located.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

A new railroad connecting the largest mining center in Mexico, Pachuca, with Tampico, is to be constructed through three states in Mexico.

Nearly $750,000,000 must be expended annually to keep pace with the increasing demand for power and light in the United States. Last year electric energy measuring 43,100,000,000 kilowatt hours was consumed.

Products from South American fields and orchards will soon be common in the markets of this country. Chilean vegetables and fruits are arriving in New York in good condition, standing the voyage from Chile in first-class manner. The Panama Canal shortens the route and makes this possible.

Tomatoes, spinach, celery and cabbage are 92 per cent water.

Nearly 2,000,000 miles were traveled by French airplanes of the commercial type in 1921. This involved more than 6,000 flights.

Three thousand French churches, totally or partly destroyed during the World War, are to be restored without waiting for German reparation funds. The money is to be provided by a 200,000,000 franc church reconstruction loan which has reached a full subscription.

Talk meters are being installed on telephones and it is claimed they measure conversation after the same fashion that other meters in the house measure gas, electricity and water. The new instrument is known as the telechrometer and as fully 50 per cent of all telephone conversation is either unnecessarily long or frivolous, the new invention will work a saving to the operator. Every time the receiver is taken off the hook on a party line, the meter begins to operate. The eavesdropper will be charged as much as if he had made the call.

Hundreds of admirers of John Burroughs tramped miles to be present at the unveiling of a tablet of bronze in honor of the great naturalist, at the Burroughs homestead, April 3. The unveiling was by Ursula and John Burroughs, grandchildren of the naturalist.

One of the largest apple orchards in the world, located near Dufur, Oregon, soon will be destroyed to make room for the more valuable product of wheat.

The 1,615 subscribers of the San Francisco Chinatown telephone exchange, are called by name instead of number. The operators are Chinese girls who were educated in the San Francisco public schools and speak English and Chinese fluently.

Changing artificial light into "daylight" has been accomplished by an artist of London, England. He uses a reflector having a novel arrangement of colors painted on the interior surface of the reflector. The colors absorb the energy of the light rays to such an extent that it produces the effect of sunlight.

A baby born into this world now has less chance to live one week than a man 90 years old, according to the New York State Commissioner of Health.

The vessels passing through the Suez Canal in 1921 carried 18,118,999 net tons. This is an increase of 544,000 tons over 1920, although there was a decrease of 34 in the number of vessels run.

Rain or snow falls five days out every six in South Georgia, an outpost of the Antarctic Ocean, east of Cape Horn. Violent gales rage throughout the year, the wind frequently reaching a velocity of 140 miles an hour.

Mayor Oles, of Youngstown, Ohio, has purchased a motor car with which he already has captured several speeders. He says he can catch any speed violator in the city and expects to make $100 a day for the city in his spare time.

The Labrador Eskimos appear to be a dying race, according to the vice-governor of Northern Greenland. The Laborador natives are in need of protection from unscrupulous traders who drive them farther north year after year.

A poison-tipped spear taken from an African tribesman fell from the wall and its point pierced the foot of a New York girl. It was at the home of an African explorer that the accident occurred. An African native administered an antidote known to the Africans and she was rushed to the hospital where she was treated.

ALBERT B. FALL,
Secretary of the Interior.

Says Vast "National Estate" Must Be Developed

Secretary of the Interior Points Out That Resources Would Help Bear Tax Burden

By ALBERT B. FALL

Secretary of the Interior in an authorized statement to A. R. Pinci

THE public domain is fast disappearing. The time has come to determine, if only approximately, its extent and its value. Wealth from our public domain—that is to say, wealth from our natural resources—has been brought in the past by American initiative, American energy, American industry. We possess business capacity in a most remarkable degree as individuals. It is essential that we take stock, determine what we have and how much of it, to enable us to do better, as a government, in the future than we have done in the past.

Data recently prepared by the Department of the Interior (of course, it will be understood that these figures are merely estimates) show that the total valuation of the "national estate"—the actual value of products when the same are realized upon—would be a minimum of $150,000,000,000. It might be more, much more. Of this amount the estimated amount that the United States would receive by way of royalty, rental and other miscellaneous returns, would be about $12,000,000,000.

Valuations Put at Minimum

NEEDLESS to say, so as to be within reason, all valuations have been set at their minimum, whether as to land areas, tonnages of coal and phosphates, volume of oils, quantities of timber, and so on. The net worth of this vast wealth to the government is as follows:

Coal royalties, $5,900,000,000; Alaska coal royalties, $1,000,000,000; oil royalties, $175,000,000; Alaska oil royalties, $2,500,000; oil shale royalties, $5,000,000,000; phosphate royalties, $280,000,000; potash royalties, $30,000,000; annual returns from water power, Alaska and United States, $1,550,000; value of vacant lands subject to entry (not included in private estates) $310,000,000; national forest lands, $1,000,000,000, and value of Indian reservation minerals, $5,800,000,000.

The approximate area of the public lands of the United States, reserved and unreserved, was, at the end of the last fiscal year, 433,265,102 acres. Of this the unappropriated and unreserved area, exclusive of Alaska, was 200,320,128 acres. The reservations and withdrawals, not including reclamation withdrawals, consisted of 232,944,954 acres.

Approximately 154,000,000 acres, reserved and known as forest reserves, for the greater part are used for grazing and are fitted for grazing homesteads, while other large areas are susceptible of cultivation and may hereafter furnish homes for some of our population. The Department of the Interior has jurisdiction over these forest lands when thrown open and has jurisdiction also over mines and mineral claims and agricultural entries on such reserves.

Resources of Alaska Are Great

A LARGE portion of the remaining unreserved 200,000,000 acres is only fitted for grazing live stock, so it can be readily seen that we can no longer pursue the policy of rewarding our returned soldiers by providing them with free homesteads under bonus or additional homestead laws, or by any other legislation such as has followed war, from that of the Revolution to the Spanish War. Provision may be made for large numbers of these soldiers, as well as other citizens, by which they may acquire homesteads under the various reclamation projects now either in course of construction or proposed to be hereafter constructed.

In referring to our national estate, the resources of the great Territory of Alaska and the wealth to be drawn therefrom in the future are worthy of note. They are almost incalculable. There are 21,000,000 acres of land in forests in that territory and many millions of acres on the public domain on which settlers may depend for mining timbers, lumber for houses, and the like. There are millions of acres of land fitted for agriculture, and the agricultural resources are such that a large population can be supported in Alaska without the importation of foodstuffs from the United States or other countries.

Vast deposits of valuable metalliferous minerals and great coal mines are known to exist and must be made accessible to the railroad and to coast transportation. This, of course, necessitates the construction of wagon roads, trails, and the development of water transportation from coast points to seagoing transportation lines.

Alaska's resources have not been developed for various reasons, among others the lack of transportation. Transportation is necessary, of course, and the government must assist in the matter. The government has assisted in so far as the construction of a railroad from Seward to Fairbanks is concerned; this road will be ready for operation in a few months.

Reclamation Is Important

THE reclamation of public lands is one of the most important activities of the Department of the Interior, and, unfortunately, criticism from various sources has been directed from time to time to the general policy of the government in appropriating money for the reclamation of arid lands and the development of the agricultural interests of the arid country. Such criticism is made without thought.

The funds appropriated by Congress for the reclamation projects are derived almost entirely from the sale of public lands in the public land states, from receipts from oil on said public lands, and similar sources of revenue. The cost of the projects under the law is to be and is being repaid by the purchasers of water rights and lands under the projects themselves, thus constituting reimbursable funds to be used again as they are received in the Treasury.

Various reclamation projects are under way in Northern California, Nevada, Oregon, Washington, Montana, Wyoming, Idaho and Nebraska. The majority of these projects are well managed, and the farmers located on them are generally satisfied with such management. Of course, the farmers on the reclamation projects have been suffering from the general stagnation as have those engaged in agriculture all over the United States.

Of course, dissatisfaction has often been expressed. Persons engaged in procuring settlers for the lands have in many instances been overly enthusiastic and painted the beauties and advantages of some of our projects in gorgeous colors. Stern reality has in many instances disenchanted the settler, who has learned that home-making means hard work, and in many instances hardship, although carried out with the assistance of the United States Government.

Fixed Sum for Water Rights

VIRTUALLY every project is successful, however, and the large portion of the amount heretofore expended and to be expended in its completion may safely be counted on to be returned under the provisions of the law. To avoid complications and misunderstandings, in the future a water right should be sold for a fixed sum. This new policy should be included in any legislation enacted, and, of course, accompanied by provision for the payment of reasonable interest on deferred payments.

When the Reclamation Bureau was created the work in some instances was of an experimental nature. It was felt then that it was impossible to fix a definite price under a given project at which a water right could be sold to the user, either in justice to himself or to the government, and hence it was impossible to adopt a plan by which, based on a definite per-acre price, interest could be charged on deferred payments. Had interest at government rates been charged to water users on 20-year deferred payments at the price which such water user understood originally that he was to pay, the principal and such interest would have amounted to more than the per-acre charge which the water user now thought was probably too great.

Under the policy which has been followed, where the water users have agreed to repay the project costs and the operation and maintenance until all construction charges have been repaid, the original estimates have necessarily been very largely increased in many instances and the water users have found themselves under obligations to repay larger amounts per acre than had been contemplated, and in some instances understood, by them. This has been brought about at times by the insistence of users themselves that addition should be made or additional work be done which was not originally contemplated.

It is to be hoped that, profiting by past experience, it may be possible in future operations to make definite contract for the sale of a water right at a fixed price with interest on the deferred payments, and when this policy can be adopted much of the complaint which has been heard in the past, but which is dying out, will be entirely done away with.

Meanwhile, there are now under consideration different bills in the Congress of the United States providing for further activities in the matter of reclamation of public lands. Should such proposed bills be enacted into law, additional opportunity for labor will be offered to the unemployed and at the same time homes made for those who desire them. One of the matters now receiving consideration is the project for the construction, by private individuals or by the government itself, of a large storage reservoir on the Colorado River, with two principal purposes in view.

First, the protection of the Imperial Valley and other irrigation projects from the present constant danger through overflow of the uncontrolled storm waters of that great river.

Second, the production of hydro-electric power through the Boulder Canyon project in the enormous amount of approximately 700,000 horse power.

Finish Irrigation Projects

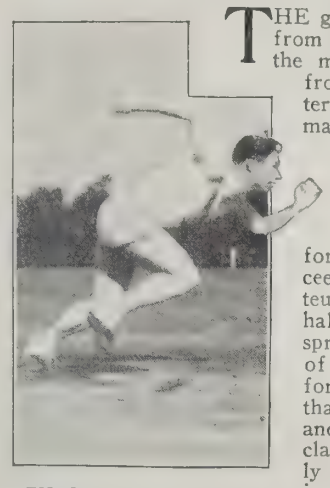
REFERRING to the proposed completion of irrigation projects now under partial construction and to the construction of other irrigation projects, I most seriously hope that an affirmative strong policy will be announced by the President. The necessary advances can be made from year to year without becoming an excessive burden on the taxpayers, and as has already been proved by experience, one year's crop on one acre of reclaimed irrigated ground will be of a value largely in excess of the total amount expended in making such acre productive. Under the present system or any proposed legislation, of course, the cost of such project will be repaid and meanwhile the annual added wealth yielded will lighten the tax burdens on all the taxpayers of the country.

The Department of the Interior—the Home Department—is fully equipped and prepared to do its part in the development of those great natural resources which must be so developed if the tax burden on this and future generations is to be borne at all. Adequate and business-like legislation is needed.

It is the American, the individual, who goes out, sleeps on his blankets, punches his burro loaded with cooking and mining utensils. He is the man who has discovered and made possible the development of the great natural wealth of the country. And he is the man who demands the right kind of legislation.

Must Husband Resources

TAKE the oil question. It is now the greatest question for consideration in this hemisphere. It is a subject that must be considered with an eye to the best interest of this country first, last, and all the time—and at the same time to the advantage of our trade and commerce with other countries. One lesson has been learned from the war—that the nation which controlled the oil industry controlled commerce by the sea, in view of the fact that no coal burner can compete with an oil-burning ship.



Realizing this, certain foreign countries have adopted a policy of excluding Americans from oil fields under their respective authority. Yet American oil men are the pioneer prospectors in the oil fields of the world; our great oil companies are directed, generally, by intelligent, broad-minded American business men who, of course, realize that on governmental action largely depends the success of individual investment and consequent trade-wealth. As things are now, the American investor, individually, must come into competition with foreign governments directly or through their nationals engaged in the same activities.

It is essential that we, as a people, conserve our national estate and husband our resources.

The University That Was Built on Two Concerts

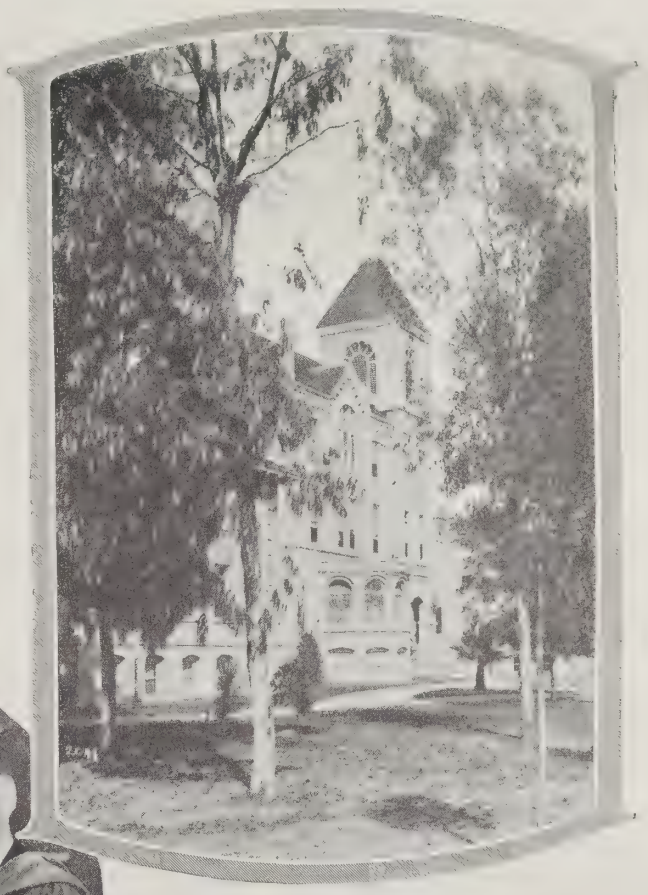
Southern California Institution Dates Beginning From Amateur's Effort in 1875

By HARRY H. DUNN

CHARLES W. PADDOCK, World's fastest runner, in action. Paddock is the greatest athlete the University of Southern California has yet produced.

THE great oak that grew from the little acorn, and the mighty ocean made from "drops of water," have their man-made parallel in one of the largest and most comprehensive of the universities of the West, for, from the proceeds of two amateur concerts, nearly half a century ago, sprang the University of Southern California, with its more than 5,000 students, and its graduating class of 500, or slightly more, at the coming June commencement. The story of the University of Southern California—which was established by, and still draws a large part of its support from, the Methodist church—is like the stories of most of the other institutions of higher education in the West, a history of devotion of a few persons through many privations, and through long periods filled with seemingly unsurmountable obstacles, until finally their ambition to establish a center of learning was realized.

Along about 1875, some earnest people of the Methodist faith approached J. H. Book, in Los Angeles, with the suggestion that a Professor Frambes, of Santa Clara, California, be brought to the southern city, to open an "academy for the higher education of the youth of the surrounding territory." Professor Frambes opened the academy, but found that the problem was how to obtain the necessary equipment. Among other things, a piano was a prime necessity. Mr. Book thereupon organized the church choir into a concert troupe, gave two concerts with this amateur talent, and raised enough money to buy the piano and have some left over for other needed equipment. And from this little acorn of amateur concert work grew one of the largest universities on the Pacific Slope.

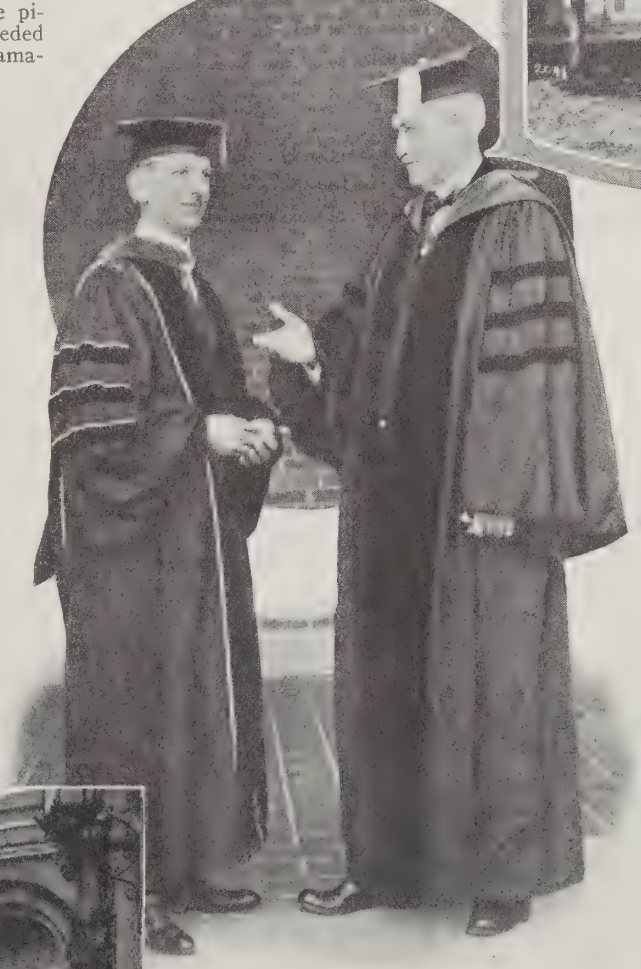


For four years the little academy struggled along, until, in response to an apparently general feeling that the interests of Christian education demanded the establishment of an institution of higher learning in Southern California, plans were laid which, on July 29, 1879, resulted in the founding of the university, as a university, and not as a college. Many there were who believed the greater title too pretentious, and that a general college would have been better, but the founders clung to the greater plan, and it eventually triumphed. The original deed of trust was executed by men whose names even now—though many of them have passed on—are well and widely known throughout California, and in most of the other states of the western shore of the continent.

The list of these men include Ozro W. Childs, Isaias W. Hellman and John G. Downey, as the donors, to A. M. Hough, J. P. Widney, E. F. Spence, M. M. Bovard, G. D. Compton and R. M. Widney, as trustees. August 8, 1880, the incorporation of the university was effected, with a board of directors of 11 persons, most of whom have since become famous in Southern California business or professional life—A. M. Hough, Charles Shelling, E. F. Spence, P. Y. Cool, S. C. Hubbell, E. S. Chase, P. M. Green, J. G. Downey, E. M. Widney, J. A. Van Anda and F. S. Woodcock. These, with the donors and trustees of the university, are generally considered as its founders, though the actual idea of this center of education goes back to the little academy fostered by J. H. Book in the old Fort Street Methodist Church, five years before. The corporation today consists of 30 trustees, and the university is almost a city in itself. The articles of incorporation provide that the trustees shall be elected by the Southern California Annual Conference of the Methodist Church.

The first building of this university was erected on the present campus site in 1880, and that no time was lost between the incorporation and the actual work of the university may be seen when it is recorded that the institution opened its doors for the reception of students on October 4, 1880. Then, as now, the institution was co-educational, and there is no honor to one of the sexes that the other may not attain in the University of Southern California.

The university campus, when selected, was outside the city limits, or, at best, on the outskirts of what is now a city of more than 600,000 inhabitants. Today it is well within the limits of that city in the heart of its most desired residential property, and in close proximity to Exposition Park, in which more than $1,000,000 has been expended recently in erecting and equipping buildings and beautifying the grounds. The state building in this park contains exhibits of virtually all the products, mineral and vegetable, of the state; the museum of history, science and art contains the valuable collections of the Historical Society of Southern California, of the Academy of Sciences, of the Cooper Ornithological Society, of the Fine Arts League of Los Angeles, and of numerous private collections. In other words, the establishment of the university has drawn to it other educational institutions, and other educational influences, until it forms the center of a group of such institutions second to none in the West. Because of their proximity and ease of access, all these collections are at the command of students in the University of Southern California, affording these students such opportunities as few universities, no matter how richly endowed, could afford to maintain.



There are 55 acres of athletic grounds in Exposition Park, which are available for the athletic sports of the university, in addition to Bovard Field, with its new stadium, seating more than 8,000. Despite its close connection with the church, the University of Southern California believes in a "sane mind in a sound body," and gives its students every opportunity for athletic and physical development, as well as mental advancement and education. It is probably as proud of Charley Paddock, the world's champion runner, and his 10 world records, as it is of its best honor graduate in any one of its several colleges.

"Old College," of the University of Southern California.

During the spring of 1918, a campaign for an increased endowment fund was brought to a successful conclusion, with a total subscription of $1,227,000, a second campaign, for a $1,000,000 building fund inaugurated, which also was completed. This places the University of Southern California in an unusually enviable financial position among the universities of the country, and has given, as the first structure of its broad building program, the $500,000 Bovard Administration Building, so named in honor of George Finley Bovard, then president of the institution, and now president emeritus, Dr. Rufus B. von Klein-Smid, former president of the University of Arizona, having been elected to the presidency of the University of Southern California in 1921. This magnificent new building contains the various offices of administration, the social halls, an auditorium seating 2,100, and numerous recitation and lecture rooms. It also houses the largest pipe organ in the Southwest, and, with the exception of the organ in the municipal auditorium in San Francisco, the largest musical instrument of its kind on the Pacific Coast.

The university embraces colleges of letters, music, art, law, medicine, dentistry and agriculture, with an important and rapidly growing extension division, and a recently installed college of commerce and business administration, which is rapidly becoming one of the most important branches of the university. There is a graduate school of arts and sciences.

Above—GEORGE FINLEY BOVARD, president emeritus of the University of Southern California, (right) greeting his successor as president, DR. RUFUS B. VON KLEINSMID, former president of the Arizona State University. At left—the bay window of Old College showing class ivy in corner.

2. Give both *old* and *new* address.
3. Write clearly.

Diplomacy

EUROPEAN diplomats met in Genoa a few weeks ago. They met as "diplomats" have met since statecraft made the first of that long series of mistakes which has bathed the world in blood for centuries.

In a word: They met with chips on their shoulders.

Premier Poincaré, filled with the imperial spirit of the French Republic, came with ultimatums and demands, with open determination that no dotting of the I nor crossing of the T should be eliminated from the reparations.

Germany came with inward chuckling over a secret treaty with the Russian Soviet Government, her envoys intent chiefly on picking a time of disclosure when they might create the greatest consternation. The Soviet's envoy appeared with a silk hat as a proletarian concession to capitalism, but he came without denial of the fact that 48 Bolshevik divisions were massed on the border of Poland, ready for an offensive.

David Lloyd George, the British prime minister, made the nearest approach to an attitude of good fellowship. But national aims were given the forefront in the attitude of each delegation; possible concessions were kept in the background.

European statecraft follows the customs of the merchants which have become predominant influences in that continent. It consists in each nation demanding the outrageous utmost, with the inward expectation on each side that dickering will ultimately reach a fifty-fifty basis of agreement. Sometimes that basis is not reached, and war ensues. How much better it would be if diplomacy was straightforward, and if diplomats did not permit their heroics to threaten the real welfare of the people they represent.

Read—and Weep for America

THE lists of indictments in the large cities of the country afford ready evidence of the source from whence has come the chief agitation against prohibition.

In one of the typical cities of the country recently a Federal Grand Jury returned indictments against 67 individuals for violations of the prohibition enforcement laws. The persons indicted were:

Anthony Beniusin, Joseph Dertz, Walter Sikorski, Joseph Podsiod, Gustabe Christian, George Levinson, Tony Buholtz, Mickey Moore, William Moss, Nicholas Weins, Mark Sheridan, Paul Dorrington, Joseph Roberts, John Drugnitzski, Solomon Miller, Fred Kinniker, David Spaight, Sol Marks, Roy Pask, John Welling, August Meier, Pete Crevar, Frank Stefano, Anthony Graska, Edward Shively, William Nykiel, John Wagner, Angus Graves, Jacob Roe, Chester Britz, Frank Montie, Emmet Billingsley, Henry Noisson, William Trappe, Frank Johnson, Peter Jankowski, John Schlifke, George Rakich, A. C. Herz, William Ernie, Albert W. Woodruff, Charles Kosnick, Sam Kosnick, John Perry, alias Jos. Perry; Edward Champagne, John Persenski, Anna Wysocki, Justin Krivick, Leo Paziker, A. C. Hertz, James Williams, C. J. Hanmill, Daniel Ginsberg, John Pock, Robert Owens, Joseph Olschewski, Kamen Chirich, Anthony Lujeski, Albert Wrobel, Albert Mirowski, Charles Orange, Ernest Leonard, Alex Cohen, Dora Cohen, Richard Cohan, Rosa Popinski and Mrs. Augusta Koss.

The defendants belong to a type of recent immigrant which neither respects nor fears the American law. In the particular city mentioned, the cosmopolitan political influence is controlling, and clubs of hyphenate names openly sell and permit the use of beers and liquors.

There has been a great effort to show that the country is dissatisfied with prohibition. Considerable noise has been made by those persons instinctively opposed to the policy, but it is the noise of the discordant minority. There is a type of person notable chiefly for the loudness of his shouting, the extravagance of his gesticulation. He does not rely on reason or fact to carry his argument, simply seeks to shout down the opposition by incessant clamor. It is to this type the country owes the attempt to bring the Constitution into disrespect. The strength of this noise is no indication that any considerable portion of the people support its object. The fact is, the real sentiment of the majority is the sentiment of quiet, law-abiding citizenry. The real American does not megaphone his views. He thinks them, votes them and, if occasion demands, fights for them.

Jazzing Your Food

A NEW YORK restaurateur, on the closing of his famous place, a few days ago, said:

"Restaurants don't pay; eating places pay, but not restaurants."

It was not against the prohibition law that this man complained. Rather it was against the changing clientele which had robbed his place of its atmosphere of gentility, and elegance.

A few years ago, New Yorkers of the old school and quiet visitors from this and other continents, occupied with selective care the tables at the famous restaurants. They selected their food with thought sometimes epicurean in its degree. They ate leisurely, and they sought no entertainment other than that which their own and their friends' conversation and culture could afford.

But this generation was driven from the restaurants. There came the reign of cafés. Gourmands replaced epicures. Huge appetites succeeded good tastes. Noise and excitement banished quiet and culture. Jazz bands were required to compete with the diners. The dance craze came, and the modification of the dance from grace to gyration to enable flat-footed persons to participate on equal terms with real dancers.

The overhead of the jazz café was naturally tremendous. The time arrived when decision was necessary on the sacrifice of fine selection of foods, the careful service and the good cooking, or the giving up of the new jazz outlays. With the old custom driven away by alien influences, jazz won. Ruin followed.

Where the Dove Roosts

LOVERS of peace may congratulate the world over the splendid advances since 1921 in the cause of world harmony.

It is 60 per cent more peaceful in Mexico than in 1921. Brokers advise their clients that Mexican peace, not to mention "Mexican Pete," are good safe investments. The land below the Rio Grande which a few short years ago was overrun with Yaquis, Villistas, burros and revolution, now bubbles with oil. Stalwart defenders of American rights who sold short and demanded that the United States intervene, are now buying Mexican securities, and pointing out that Mexico should be allowed to work out her own destiny. Newspapers whose owners feared for the safety of American lives and their own plantations below the Rio Grande now ooze forth praise of the administration of General Obregon.

Just what the difference is between the *conditions in Mexico* in former years and now does not appear. But the difference in *conditions in the United States* is clear. They can be accurately measured by the finest barometer in the world—the New York Stock Exchange quotations.

It is the stuck pig that squeals. And a few years ago, it was in the stock market that the most tears fell for the trampling on American property rights in Mexico. There the loss of American life in bandit raids was not so keenly felt, though the market propagandists did not scruple to use the loss of life to arouse the general public.

But times have changed. Mexican Petroleum, the famous "Mexican Pete" of the market, has risen in a year from 84 to 135. Other stocks in Mexican securities have shown pronounced upturns on the New York market. A member of a New York banking house visited Mexico at the invitation of the Mexican Government, and subsequently the stock-buying public began to learn that there was a prospect of the payment of the defaulted interests on Mexican bonds. The national debt of Mexico is only $24 per capita, extraordinarily low for a country of its natural resources. International bankers believe that Mexico will stand a much higher debt and are prepared to float, on a proper commission, such interest-bearing loans as the conditions permit.

It is natural, therefore, that the country should learn by the latest dispatches from Wall Street that peace and economic adjustment are spreading like wildfire over the turbulent land of the Aztecs. Mexico is pacified, you can take it from any broker, and Mexican securities are good buys. They can prove their contention by figures, too, the market quotations on Mexicans averaging 60 per cent higher than one year ago.

"A Daniel Come to Judgment"

THE Federal Reserve Bank of New York, evidently taking heed of the criticism of the management of the system, has issued an argument which, with but slight alteration, warrants all that has been said against it.

To read its statements without knowledge of its source would lead to the reasonable inference that a disciple of the new theories of money and its functions—new only in the sense that a revival of discussion makes them so, since the older advocates have periodically been ridiculed into silence—had written the thesis. The ground taken is sound, but the argument itself is not consistent with the facts. In one respect a fatal defect occurs: credit is not given the backing of the United States and its pledge to maintain a parity for every Reserve and Reserve Bank note.

> "The Federal Reserve Act in prescribing the security behind Federal Reserve notes introduced a new principle into our currency system. It specifies a security which is sound and at the same time increases and decreases automatically with the business and agricultural needs of the country."

No doubt that was the intent of those who were persuaded into the passage of the law, but the proposal of Congress is not always the disposal of the real rulers. Before showing how this very principle, which is not exactly new, is misapplied, the reader is invited to read the extract carefully. In it is an endorsement of the theory of the necessity of maintaining a currency volume equal to the demands of business and agriculture—*and this is the basis of every demand for monetary reform.* This necessity has been ridiculed as unsound by every financial writer in the country who has undertaken a defense of the Federal Reserve System, and those who have insisted upon it have been posted as fanatics, fools and wild theorists. Yet here is the greatest of the Federal Reserve banks, the most profitable regional bank in the country, the only bank that has dared project a $25,000,000 building because of its excessive surplus, calmly presenting as correct the theory that currency volume must be sufficiently elastic to conform to the volume of business to be done.

The same principle was involved in the law creating the National Bank system, and had always been the basis of state bank circulation before its enactment. That the principle has miscarried is not always the fault of the principle, but of its application. Under the old state banks there was a multiplicity of note issues, none of which was a legal tender outside of its own jurisdiction. The assistance they might give locally was ended under the National Bank Act, which imposed a prohibitive tax on other currency issues.

National banks were limited to an issue not exceeding their capital stock and by the confinement of the circulation privilege to certain government obligations, so the intended elasticity was lacking from the start.

Similar jokers in the Federal Reserve Act have made possible the arbitrary acts of the Federal Reserve Board which have had such tragic results to agriculture, industry and commerce. To quote again:

> "Apart from notes secured by obligations of the government, which have become widely available on account of the issues of bonds and notes to finance the war, the paper represents agricultural products or other goods in the process of production or in movement from producer to retailer, in process of export or import, or on the shelves of retailer or wholesaler awaiting sale."

True, but—

By decree of the Federal Reserve Board, when the country was in the midst of its greatest need for a large volume of currency, that volume was cut in half. The farmer knows the result to agriculture. The manufacturer was compelled to work up high-priced material into low-priced product, if, indeed, he could find means to keep his employes at work. The retailer and wholesaler saw the dollars squeezed out of the wares on their shelves awaiting sale. Liquidation was *forced,* and the result was industrial and business paralysis which the Federal Reserve System could and should have prevented. But the system returned its regular dividends and piled up the greatest surplus in banking history.

If proof is needed read this:

> "In recent months the gold holdings of the Federal Reserve Banks have been so largely increased *and the amount of notes outstanding so reduced* that Federal Reserve notes have come to be secured almost dollar for dollar in gold."

We ask by what process—honest process is meant—has the Federal Reserve System retired its notes and increased its gold supply at the same time. But that is another chapter in the continued story of how the country is fleeced by the masters of finance.

Mr. Ford's Page

THERE is nothing new under the sun but new applications of old facts. The newest and the oldest element of all is change, and change is usually in the direction of a better arrangement of the old substantialities. And the beginning of change is always a return to the simple principles of things, whose greatest difficulty for us is their very simplicity.

When all the wisdom of the ages is reduced to principles, the result is a few copy-book maxims. If it were not for a certain pride in "learning" which most men have, these would suffice. But men prefer to play with ideas, and indulge themselves in intellectual gymnastics rather than demonstrate the few principles which actually will work. That is to say, men prefer to amuse each other with their curious guesses about things, and call that "learning," than actually to prove that the known law of things can be trusted.

The responsibility laid upon the men of this age is not so much one of discovery as of realization. Who discovered the principles on which a sound life and a sound society may be built, we do not know; we do know this, that as far as we are concerned these principles have come to us as revelations; that is, we received them in a complete form; and our part is to build on them. It is not as if the world were bereft of the principles on which a sound civilization can be built; it is not as if we were bungling along for want of knowledge how to do better. That is not our need at all.

What the world needs is faith. Faith in what? Faith in the workable values of the principles of life which we already have. The principles are here; they are not waiting to be discovered, but to be proved; faith means simply trying them out. As it is now the world has neither faith nor unfaith. The world cannot be said to have unfaith in the principles, because unfaith could only arise out of a test and a failure of the principles. These principles have never been tried and failed; wherever they have been tried they have never failed; the tragedy of the world is that, possessing the principles, we have not the adventuresomeness that would lead us out into one grand effort of experiment in doing the right thing to see if it will work.

One of the most universal of these principles, and peculiarly applicable to the type of activity mostly manifested today, is this: "Whosoever would be chief among you, let him be your servant."

Everybody has a legitimate ambition to perform a good stroke in life, to do something that counts. Sometimes this ambition is perverted until it becomes mere desire for the fruits of a useful course—the prominence, power and means that may go with it. But wholesome ambition first concerns itself with the work which is thus rewarded, not first with the reward. At bottom this ambition is really toward a useful life and the recognition which usefulness brings.

Now, to achieve this desired position, men have used many means. Once the sword was a favorite weapon with which to carve out fame, but its desirability has decreased of recent years. Once the library was the indispensable assistant upward, and the scholar was thought of as the man who had attained. In our times the whole matter of ambition has exploded into thousands of pieces, until there have arisen men who claim that a sufficient quantity of printers' ink is all that is necessary to boost men into any desired place. Do something spectacular; sell your soul; betray your fellows; grab and shove and trample—these are the methods by which one may become chief among his fellows.

There is a sure way to a respected position in life; there is a principle which inevitably establishes a man in affection and honor and in his rightful share of material means. And that principle is no secret. It requires no mystical initiation to learn it. You do not even have to subscribe to a correspondence course to become aware of it. That principle is *service*. Here is the way to be greatest: let him who would be chief among you, become your servant. The chief man is the man who does most for the most people. The most serviceable life is the most widely known life. That is a principle.

Now, it is open to any young man to choose how he shall realize his ambition to win a place in life. He can choose to go out and by superior shrewdness fleece his fellow men, or he can choose to go out and compel their attention and support by doing something for their benefit in a better way than it has ever been done before. This latter is the only true way to lasting greatness. Greatness is proved in great gifts—not in great gifts given to you, but in gifts given by you to the happiness and prosperity of others.

There are two kinds of famous men—those, who like Napoleon have exploited their fellow men by the abuse of their superb natural gifts, and others, who like Lincoln, with rather homely gifts, have served their fellow men, even the lowliest and meanest of them. Two kinds of famous men, but only one kind of Great Man—the Servant.

But how many people can you persuade to consider this today? The very word "service" has become a bromide. People tend to become so wise in their own conceits that they imagine someone is trying to "put over" something on them when this language is used. It only goes to illustrate how slow we are in our minds, how much we lack faith.

Yet that principle stands. It stands at the bottom of any career that commands respect. It stands at the bottom of every industry that has commanded continued patronage. It stands at the basis of every idea that has survived the centuries. Just that plain principle, that the chief man, the chief system, the chief idea is that which is chiefly marked by serviceability. Whenever you see a man start off toward the goal of success on any other principle, it is like watching the departure of a leaky boat—it will not arrive there.

You would think that men would at least give this principle a trial, would you not? There it is, highly attested, living on in the face of universal neglect, as ready now as it ever was to prove its dependability to the commonest kind of people—that the way up is by the steps of service. The chiefest man in contentment, the chiefest man in sanity of outlook, the chiefest man in satisfaction with his work, the chiefest man in the respect of those who know him best, is the man whose life is lived by the principle of service. No matter where or what he is, the principle places that stamp upon him. The principle proves itself in him.

Being a principle, it is without partiality or prejudice. And being without prejudice it holds out a hope to men who have tried to climb by the way of exploitation, and have failed. There is no prejudice in this principle against a man who has failed in some other way. Let a man cease viewing his fellows as beings from which something is to be taken, and begin to view them as beings for which something is to be done, and he has already made a transfer of principles. He has made the cross-over from the false to the true; he is on the track where everything in the universe is on his side, and where he is on the side of the universe.

To do this in the first instance is a matter of faith; after that comes demonstration, and then faith becomes knowledge. Faith in true things is always becoming knowledge.

THE world has not been left in the dark, dependent on its own discoveries of the right way through the maze. Principles handed down to us from of old contain the very secret of successful individual and collective life, and merely await our adoption. The chief difficulty is their simplicity. They are reducible to copy-book maxims. Had they been tested and cast aside, they would have disappeared. But they have not been tried; they continue to challenge men; and the one thing needful is faith enough to give them a trial. Most people think that faith means believing something; oftener it means trying something, giving it a chance to prove itself.

Museum Acquires Prints From Aix Intaglios

Frederick Barbarossa's Gift to Cathedral Was Forerunner of Engraving; Public Sees Works of Art, Rescued From Magnificent Oblivion After 700 Years

Intaglios of the Corona Lucis at Aix-la-Chapelle. To the left is depicted "Christ on the Cross." At the right is "The Annunciation," and below, "The Nativity."

IN THE magnificent Cathedral of Aix-la-Chapelle above the spot which is supposed to be the site of Charlemagne's grave, there hangs an immense corona of lamps. It was the gift of an emperor, little less famous than the great Charles; in other words, Frederick Barbarossa.

To the Boston Museum of Fine Arts, there recently came a collection of rare and extremely valuable ink impressions from 16 intaglios on copper, executed in 1168. The original plates engraved several centuries before engraving became one of the allied printing arts, were made for decorations for the great votive chandelier, Corona Lucis or Crown of Light.

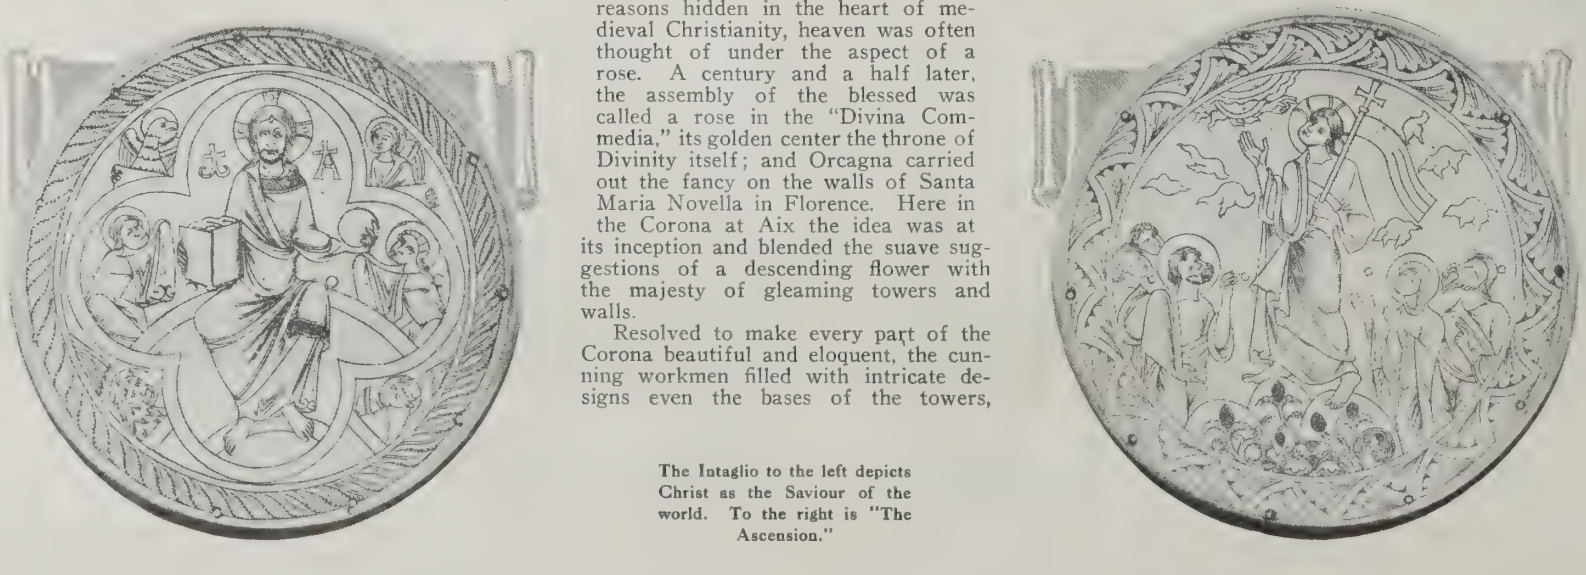
About the middle of the last century the Corona was taken down for cleaning and repair, and someone in charge, doubtless charmed by the intaglios and reluctant to see them returned to comparative oblivion in a dimly lighted cathedral vault, had the happy thought to use them in the interim for printing a limited number of sets by hand inking and rubbing. A few years afterward, Dr. Fr. Bock, Honorary Canon of the Cathedral, had other impressions made for a monograph which he devoted to the Corona. Ten years before M. Cahier had made the Corona the subject of a learned, entertaining and instructive study, containing engravings of all the intaglios. Sets of these engravings are preserved in the British Museum, in Berlin and a few other places. One of these sets from Dr. Bock's book is the set acquired by the Boston Museum.

The place, the occasion and the persons for which the Corona Lucis of Aix was made were all of exceptional historical importance. The place was the tomb of Charlemagne within the Cathedral founded by him; the occasion was a solemn exposition of his ashes; and the persons, his Hohenstauffen successor, Frederick Barbarossa, styled in an inscription upon the Corona "Caesar Catholicus Romanorum Fredericus," and the Empress Beatrix.

An inscription relates that the Corona was intended as a symbol of the Celestial City—the city that "had no need of the sun, neither of the moon, to shine upon it, having the glory of God." The Heavenly Jerusalem was to be set forth under the chosen semblance, "Celica Jerusalem signatur imagine tali." In previous centuries the custom had grown up of suspending a cross over the high altar of churches and above it a crown in which candles were fixed as in churches of today. One of these ancient coronae still hangs in the cathedral at Hildesheim, Germany, dating from a century before the Corona at Aix, and represents the 12 gates of the heavenly city upon the copper band.

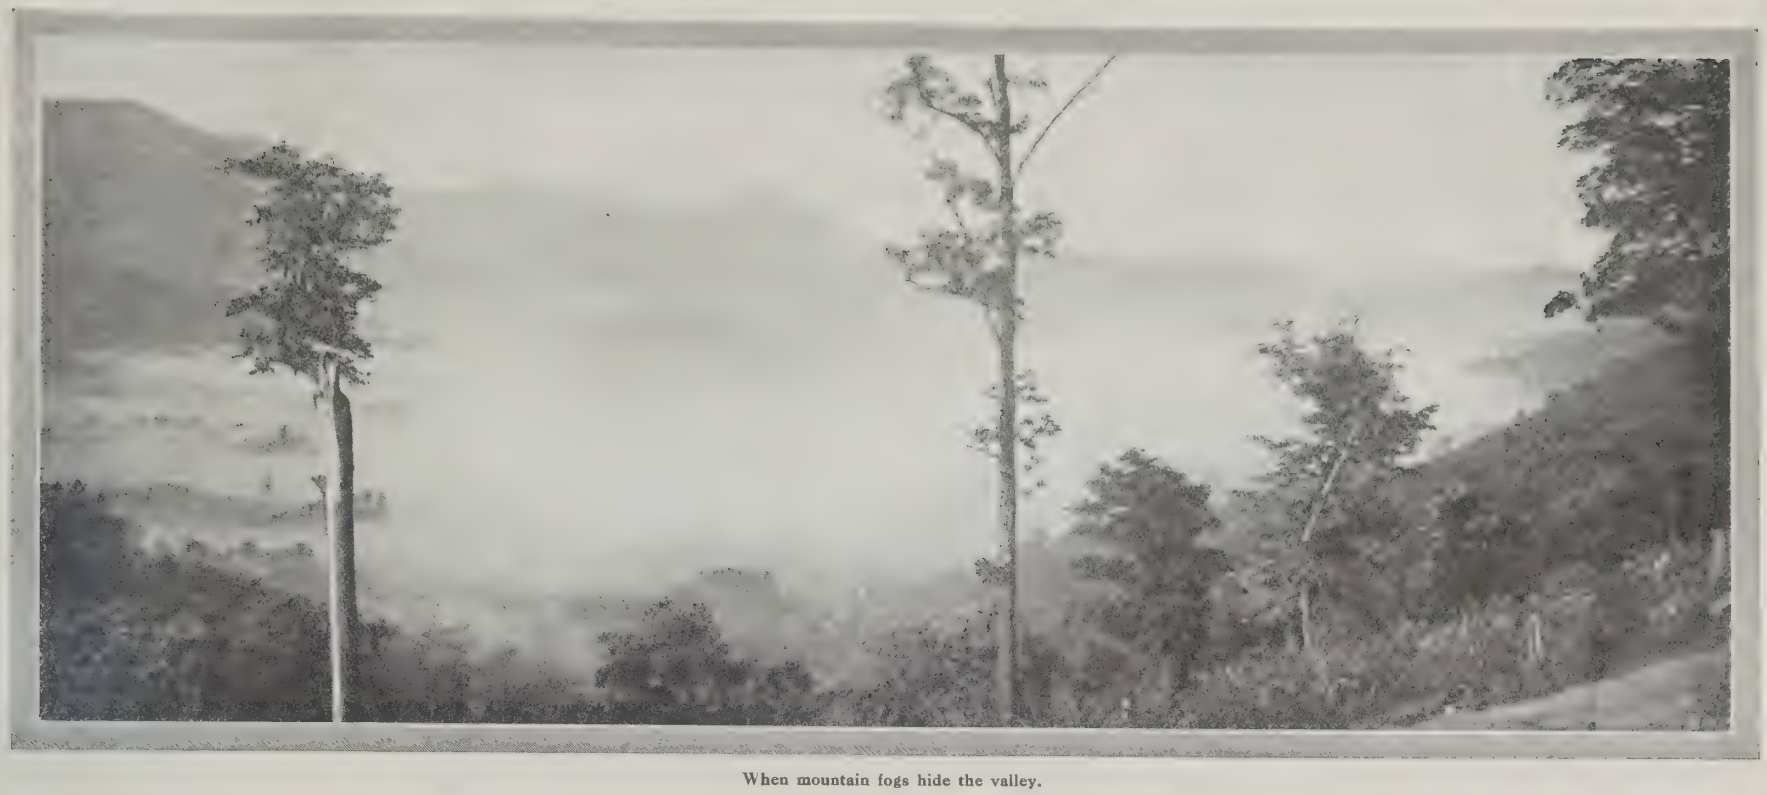
These 12 gates, the larger Corona at Aix, 13 feet in diameter, were transformed into tower gates and supplemented with four corner towers. In the towers lamps were placed and on the edge of the frame, representing walls, 48 candles. With its many lamps and candles and its shining and varied surfaces, the Corona lighted must have been a brilliant sight, and to the people of the twelfth century, an overwhelming luxury of illumination truly imaging the city of light. Cathedral records at Aix show that the Corona was used for illumination of the church at festivals. In bequests received for services on other anniversaries, it was sometimes specified that "the Corona shall be lighted." It witnessed, and doubtless helped to make brilliant, the coronation of the emperors at Aix for 700 years.

The form of the Corona contains another symbolism. If we join the central point of its plan, representing the chain of suspension, with other branching chains directed first to the four corners of the squares, a figure appears resembling a flower of four petals with four others partly showing between them. For reasons hidden in the heart of medieval Christianity, heaven was often thought of under the aspect of a rose. A century and a half later, the assembly of the blessed was called a rose in the "Divina Commedia," its golden center the throne of Divinity itself; and Orcagna carried out the fancy on the walls of Santa Maria Novella in Florence. Here in the Corona at Aix the idea was at its inception and blended the suave suggestions of a descending flower with the majesty of gleaming towers and walls.



Resolved to make every part of the Corona beautiful and eloquent, the cunning workmen filled with intricate designs even the bases of the towers, although their work could be seen with difficulty only by looking upward from the floor. Upon eight were depicted episodes in Christ's life, and upon the other eight were pictured the blessings bestowed by the Master on those who follow Him.

The plates bearing the Beatitudes consist of gratings and on each is represented an angel folding a scroll. Personages in these designs are well-favored, well-built beings, with comely hands and feet and rounded and expressive features. Of the frowns and angularity of the Byzantine mosaics there is no trace, nor of the emaciation and elongation that the artists of the time felt was the necessary mark of holy sacrifice. Their mien and their movements simply and intimately reveal the wonders they depict. The Virgin of the Annunciation bends a girlish head and raises graceful hands as she shrinks before the message of the angel. His features are delicately differentiated from hers; he is still moving, with wings just closing. As he gazes, so might any noble young herald of solemn and joyful tidings have stood and gazed.



Perhaps the most complex design is that of the blessing on the Meek where, by a naïve fancy, one of the hearers hesitatingly grasps the edge of the angel's mandorla; the most boldly graceful is perhaps that of the Blessing on the Seekers after Righteousness. The most deeply emotional design is that of the Blessing on those that Mourn.

Romanesque fondness for luxurious interlacing patterns which was to sober down through the Gothic age into the development of the pointed arch—is given full play in the ornamental borders of all the fields.

Each of the plates is about seven inches in diameter. They are the oldest copper engraved plates as yet printed from. There are eight circular, four rectangular, and four medallion shaped plates. The impressions were remarkably well taken, although in some of the earlier ones, parts of the figures were slightly lost and in the later ones some of the inscriptions are gone. This was due, probably, to imperfect cleaning of varnish from the lines of the intaglios.

The Intaglio to the left depicts Christ as the Saviour of the world. To the right is "The Ascension."

When mountain fogs hide the valley.

Legends of Creation Haunt Mountain Wilds

Folklore of Cherokee Handed Down in "Unknown America"

By HARRY E. BARNET

IT IS not just a fancy to give the name of Unknown America to that part of the southern mountains which centers around an old swag-bellied tree overhanging the headwaters of New River in North-central Tennessee. It is merely by way of stating the fact that few people know what is ambushed among the peaks and depressions you find there.

Furthermore, this situation is not a new one. Unknown America has been a hermit country since its peaks and depressions first saw the light of day. News of what went on there hung close around the spot where it happened. Therefore, we have an Unknown America, either because it failed to attract the attention of the world at large, or because it preferred to settle back as a sort of a recluse land that has done little else through the ages except to brood, and to encyst its people, its latent wealth, and its ruins in mystery and oblivion.

When you attempt to describe this country you are face to face with trouble. If you write of it in a manner that will do justice to Unknown America you will make statements that are not like the ordinary descriptions that men write of other regions that are mountainous. Then you may be shunted into the company of the "tall yarners," and unfairly so. For nothing you see in Unknown America, and nothing with which you come in contact there, seems to have had an orthodox origin, not even the ground you walk upon. It shows a misbegotten face to the heavens—a face so misbegotten, in fact, that, topographically speaking, Unknown America can also be honestly named unconventional America. In short, its surface is an area of hit and miss that sprawls from its center near the headwaters of New River over hundreds of square miles into Kentucky, into the Carolinas—even into a corner of Virginia—and that spreads across some of the country of Georgia and Alabama.

For this reason, about the safest, and probably the best, pen-picture to draw of Unknown America is the declaration that it is more crumpled, and more deeply gouged, and each of these in a more fantastic manner, than are other highland regions. And it is more thickly covered. The face of its cliffs are veiled with clinging plants. These cliff faces also bristle through their drapery with immense trees that grow outward at crazy angles from crevices where not more than a bucketful of soil can find a permanent resting place. There are no barren peaks in Unknown America. There are no valleys that are naked. All of them are overlaid with abundant timber growth, and with hordes of plants and vines, upstanding from dense grass.

In this unorthodox country you are continually bedeviled by curiosity to know the "how come" and the reason of being. In other words, it is a tormenting environment in which to find yourself. For you sense mystery at the very moment you step into Unknown America, and you're enveloped with the maze of mystery up to the very moment you step out from its scragginess. And you are continually astir to get at the cause of it. But you make no headway. The outcome of the work of these men, however, shows entertaining, if not scientific and reliable, results.

This outcome is the lore of the Cherokee. They were the Indians the white immigrants found in Unknown America. No one knows when they settled there. But the Cherokee said they followed earlier migration. The Cherokee said that when their ancestors came it was tenanted by ruins and the remnants of a white race, with moon-shaped eyes and auburn hair, who lived in log forts in the Chickamauga country. What became of these moon-eyed people the Cherokee of later years failed to state, because their ancestors lived only in the present; they cared little about things that were over and done with, and passed little or no record to their descendants.

It is evident, however, that the atmosphere of mystery then hung over Unknown America, and was felt by the Cherokee. For they importuned their priests for explanations of what they saw about them. The priests answered with stories. At first these stories were part of a sacred narration told only by the priests, but later the narration was broken into fireside tales.

The priestly recital of the genesis of the distorted surface of Unknown America lacks a detail. It fails to mention the creator of the traditional animals and the plants, which were of heroic size, but starts off with the statement that after the animals and the birds, the reptiles, bugs and the fishes, the plants, trees and shrubs were made they were told to keep awake and to watch for seven nights. They tried to do this, and nearly all of them were awake through the first night. The next night several of them dropped to sleep. The third night others fell asleep; and then others on successive nights, until on the seventh night only the owl, the panther, and one or two others were awake. As a reward for keeping awake they were given the power to see in the dark, and to make prey of the birds and animals who sleep at night. Of the trees, only the spruce, the cedar, the pine, the holly and the laurel were awake, and to them it was given always to be green. To all of the other trees it was said: "Because you have not endured to the end you shall lose your hair every winter." There was the start of the annual job of sweeping the leaves from the lawn, and of burning them in the gutter.

At that time, according to the explanations of the priests of the traditions, there was no land, merely water. These heroic size living things were above, on the sky arch, which the priests said was a solid rock. There was a big crowd on the sky arch, and they wanted more room. They looked over the edge of their habitation, and saw the water. Then the crowd wondered what was below it, but no one felt heroic enough to start out. Finally, female bravery settled the question. The she water beetle offered to explore. This was the Eve of all the water beetles who since have scampered across the ponds on the face of the earth. She darted in every direction across the surface of the water, but could find no firm place. She dived to the bottom, and came up with some soft mud, which she set afloat. She clambered upon this ball of mud, rested, and inaugurated the fashion of paddling a canoe.

Soon after the she water-beetle returned to the sky arch this ball of mud began to spread like a batch of bread that is piquant with yeast. Finally, it became a great island. Some careful souls among the animals fastened it to the sky arch with four cords, one at each corner, but here again the priests of the traditions were careless with details, and did not mention who did this. The priests prophesied, however, that when the world grows old the people who are upon it will die; the cords will break; the earth will sink; and all will again be water.

Of course, this island was soft and damp; it was also flat. The living things above were anxious to alight, and from time to time sent out different birds to see if it was dry. But these scouts found no dry spots, and returned to the sky arch. After a long wait the buzzard was sent out—the Adam this was of all the buzzards that since then have lazily circled above the earth. He was told to make ready for the descent of the living things, if he could find enough dry land to accommodate them.

Daddy Buzzard flew over all of the flat soft island, low down over it, and in no place was it dry. When he reached Unknown America he was very tired, and his wings began to flop, and to strike the ground. Whenever they struck the wet earth a valley was carved out, and where they turned up a mountain arose. When the living things above saw this they were afraid the whole world would be mountains and valleys, and they called Daddy Buzzard back. But to this day Unknown America has been mountainous.

This wing work by Daddy Buzzard was done in the dark. When the surface of Unknown America was dry the animals and plants came down from the sky arch. Then they got the sun, and set it in a track to go every day across the island from east to west, just overhead.

The horde that descended upon the earth divided into tribes, each variety of animal and bird and tree and shrub and fish and reptile to his kind. The tribes elected their chiefs, and established their community houses, for their councils and their dances. Each living thing had a particular station and a duty. The frog, for instance, was chief of the council, and also the marshal. The rabbit was the messenger, who carried all tribal announcements. He was also the dance leader, and the foremost animal in all devilment. Birds and fishes, bugs and reptiles and plants of all kinds, however, spoke the same language.

The animals set about getting fire. They knew there was fire in the bottom of a hollow sycamore tree, for they saw the smoke coming out of the tree. But to bring the fire back to the settlement they must pass the water. They held a general council.

Each animal and bird who could fly or swim was eager to go after the fire. The raven, then a white bird, offered to go, and because he was so large and strong the council agreed. He flew high and far across the water, and alighted on the sycamore tree, to ponder the problem. While he thought, the heat scorched his feathers. He was frightened, and came back, unsuccessful. Since then the raven has been black.

The little screech owl volunteered. He reached the sycamore tree and looked down into the hollow. A blast of hot air came up, and nearly burned out his eyes. He managed to fly home, but his eyes are red to this day.

Houses remain just as their tenants left them.

Tortuga, Treasure Vault of Buccaneers of Old?

Recent Finding of Golden Coins on the Little Island Revives Tales of Wealth Buried There by Pirates

By WILBUR FORREST

PIRATE lore and tales of buried treasure; the red-blooded romancing portrayed in distinctive American literature which, for many generations, has thrown small boys, and their fathers before them, into spasmodic dreams of emulation, need not be all fiction.

Few may realize it, but our own near-by West Indies offer more genuine buccaneering history than perhaps any other single portion of the world. These islands, so closely bound to the voyages and history of Christopher Columbus, are only a trifle less famous for their part in another though less known history, the basis of which has inspired virtually all our piracy stories of fiction with the "yellowed paper chart" grasped in the hand of the pirate skeleton "remaining to guard the secret of the buried treasure chest."

The very "birth nest" of Western Hemisphere piracy is to be found in the Caribbean today. On the small island of Tortuga, actual buried pirate treasure recently cropped out in golden reality to revive the past. This island is a few miles off the northern coast of Hayti and was named Tortuga by Columbus, because it so much resembled the shape of the great sea tortoises plentiful in the tropic vicinity.

A short time ago, an old man from the tiny seaport of Saint Louis, on the Haytian coast, sailed his dory across the choppy channel to Tortuga and anchored in the mouth of a small stream that tumbles down from the island hills. He was seining for small fish bait when glittering objects in the shallow water of the stream bed diverted his attention. He picked them up and they proved to be golden "pieces-of-eight"—pirate treasure. Here was real booty from the Spanish Main, spoils cached in the coves and hills of Tortuga by the Captain Kidds of the seventeenth century.

Offers Promise of Treasure

PERHAPS no other single spot in the Western Hemisphere or the world at large offers today more promise of actual buried pirate treasure; the shades of bold, bad men who fared forth on their buccaneer brigs to prey on merchant ships, swarmed over the sides with cutlasses in their hands and daggers in their teeth to struggle to the death for booty while grappling irons held the vessels locked in victory or defeat. There are shades on Tortuga of swashbuckling buccaneer gentry who dissipated away their share of the treasure in orgies with rum or buried it for future reference.

There is no doubt that the golden coins, salvaged from the bed of the Tortuga stream by the old Haytian fisherman, were buried in some secret niche in the hills some three centuries ago, to be washed down eventually to the sea by the waters of the rivulet. Imagination paints the men who buried them in such traditional accouterments as cuffed knee boots of leather, cutlasses, which clanked against the shovels as they dug deep to inter the treasure chest, the red kerchiefs about the brows of evil visages and all.

The Haytian fisherman and companions have since searched the small treasure stream without success and possibly other expeditions have visited the island in search of other treasure troves by now.

The writer recently visited Tortuga, not so much in search of pirate gold as to compare the jungle-matted little island of today with the buccaneer rendezvous and stronghold some 300 years ago. Pirate history relates circumstantially and convincingly that here piracy started and grew until it terrorized the coast lines and waters from the Atlantic and Gulf to Cape Horn and even into the Pacific. The boldest and worst of French, Dutch and English buccaneers outfitted their ships on Tortuga and returned thence after their raids to divide the plunder and outfit the ships for further expeditions.

To one possessing only the ordinary trend of imagination, there is wild romance in every step along Tortuga's ragged coast line, up and down the rocky jungle-grown hills and in the heavily wooded valleys. Here one may reach back into the unfaded mental pictures of youthful literature and see his Captain Kidd, better known in true piratical history as Captain Henry Morgan; Bartholomew Portugaise, Rock Brasiliano, Francois L'Olonnois, or more of the leaders who made their names a terror in the Atlantic, Caribbean, Mexican Gulf, and other waters of the early western world.

Only White Man on Island

MY GUIDE informed me that about 200 blacks in small settlements of thatched huts were the only inhabitants and, at the moment, I was the only white man on the island.

The history of the place far overshadowed the modern scene. To a lone white rambler objects constantly appear that recall to mind such implements as picks and shovels, such documents as age-yellowed charts, all connecting with a golden hoard somewhere beneath the earth contained in a rusted iron-bound chest. There is, unmistakably, the big tree, now towering high above a jungle-grown mass of a hundred different species of tropic flora. To look sharply and inquisitively along the four points of the compass from this tree is invariably to find the big rock with what seem time-worn crosses and pirate hieroglyphs on its surface. One may be hyperbolic without censure. All that appears necessary is the dying buccaneer's chart and, of course, the digging implements, preferably employed at night in the dim light of flickering lanterns. Poe and other writers of buried treasure have described it thus and thus it must be in the imagination.

The term "buccaneer" originated on the island of Tortuga. It is derived from the French word describing men who cured meat by the "boucan" process, a system of smoking meat on green sticks.

As early as 1630—before George Washington or his father, or perhaps his grandfather, were born—the island of Hispaniola, which is today the island of Hayti, began to find French, British and Dutch settlers arriving there, much against the will of the Spaniards, who controlled the territory to the announced exclusion of all other nationals.

The interlopers first tried their luck at planting, but eventually abandoned this vocation to become "boucaniers," because of the great prevalence of wild oxen, cattle and wild boar. The vicissitudes of interloping, however, were such that many of the settlers fled to the island of Tortuga, which is separated from the main island by a strip of channel water seven miles wide. Tortuga offered less territory for the "boucaniers" but more security. Perhaps seven miles wide and twelve miles in length, the island was a virgin hunting ground.

Eventually came Pierre le Grand to the island of Tortuga.

Pierre le Grand was the original pirate of the Western Hemisphere. All the crimes of the Spanish Main, much of the pirate lore and actual pirating that one may read about in books, revert back directly on the shoulders of this Frenchman from Dieppe, who came with good intentions, but soon lost them. "Boucaniering" was tame to Pierre le Grand. He soon tired of it. He followed the meat-curing trade only until his earnings gave him possession of a small sailing ship and then he inveigled 28 others to follow him off the path of righteousness.

The original pirates provisioned their ship with an abundance of cured meat and fared forth. Victims were scarce, however, and only when the voyage promised failure, due to a shortage of food, the "boucanier" ship sighted a large Spanish warship sailing brazenly alone. As a hungry rat attacks without reflection on the odds against him, Pierre le Grand decided to tackle the warship. This arch pirate drew from every member of his crew an oath to fight to the death. He went beyond this, ordering his surgeon to remain below and scuttle the ship at the moment the grappling irons had been thrown over the rail of the cruiser. Thus grappled, thus sinking, he knew his men would have to fight, their oaths notwithstanding. Then Pierre, history tells us, notified the crew of the exact situation and his pirates swarmed over the side with cutlasses in their hands and daggers in their teeth, and fought the Spanish men-o'-war's men with such ferocity that the handsome prize was theirs.

Honor Among Buccaneers

PIERRE put back to Tortuga with his prize and the booty it contained. The haul represented several thousand pieces-of-eight, much plate and other treasure. Members of the pirate crew were permitted to receive their divisions and go ashore. Pierre, however, continued on to France with his Spanish frigate and quit the pirate game forever. But his work had its well-known effect. The remaining hunters and "boucaniers" of Tortuga saw greater gain in piracy and immediately began to outfit ships to prey on Spanish traders.

Within two years the buccaneers of Tortuga had captured many valuable prizes, including two huge Spanish vessels loaded with plate from Campeche, in the Gulf of Mexico, bound for Caracas. They had also seized many ships of lesser burden, all of which, combined with the larger tonnage, gave them a formidable fleet, armed with cannon and swarming with men who fought savagely with dagger, pistol and cutlass for the gain that piracy promised.

All prize cargoes were taken back to Tortuga and there divided.

There was honor even among buccaneers, if we are to believe John Esquemeling, a subject of the United Provinces (Holland), who cruised for many years as a Tortuga pirate and returned to his home country in 1678 to live on his wealth and write his experiences.

It was a sort of Utopian Soviet arrangement under which pirates sailed, according to the ancient scribe. All vessels, starting on a cruise, were amply provisioned and the "meanest" member of a crew was entitled to as much provender as the captain himself. The division of all booty was, according to written agreement, executed before the voyage. Based on "no prey, no pay," the pirates, one and all, bound themselves to fight faithfully for treasure and abide by results.

Among the notable pirate leaders who succeeded Pierre le Grand—the father of piracy—was one Rock Brasiliano, a Dutchman, who took this nom de plume by reason of long residence in Brazil. Rock's procedure discloses why he withheld his right name. He was a real pirate, a true maker of present-day tradition. Though an excellent leader in combat, "howbeit, in his domestic or private affairs he had no good behavior nor government over himself," says his chronicler, who added: "Many times being in drink, he would run up and down the streets, beating or wounding whom he met, no person daring to oppose him or make any resistance. To Spaniards he always showed himself to be very barbarous and cruel; of these he commanded several to be roasted alive on wooden spits."

Pirates were generally a pretty bad lot, agrees pirate history. For example, ashore, "they would spend two or three thousand pieces-of-eight in one night, not leaving themselves peradventure a good shirt to wear on their backs in the morning." Rock Brasiliano was only one of those given to swashbuckling.

Possibly the cruelest and most bloodthirsty of all the pirate chiefs was Francois L'Olonnois, a Frenchman, who outfitted the first ship for his piratical career on Tortuga. The enemies of this terrible Gaul received no quarter and he became known as a true terror of the seas, amassing great wealth.

Cruises of Pirates Fruitful

HE ONCE seized and held a Spanish city in Cuba until he was tired of it and then put to sea again on a fruitful expedition, which yielded many ships and numerous thousands of pieces-of-eight, and much plate and jewels. He then returned to Tortuga to divide the spoils and give his buccaneer crews their shore leave. Soon afterward, the pirate leader sallied forth again with a large fleet, carrying many cannon and more than 500 fighting men. This cruise was a great success. The pirate flagship was the first to encounter a victim, a Spanish ship of heavy tonnage, mounting many guns and loaded with men. The pirates boarded her and subdued her after a stiff fight and then sailed her for Tortuga with a prize crew and loot that amounted to 120,000 pounds of cocoa, 40,000 pieces-of-eight and the value of 10,000 pieces-of-eight in jewels. The remainder of the buccaneer fleet, sailing to a rendezvous on the island of Savonna, took a prize which netted 10,000 pieces-of-eight, 7,000 pounds of powder and an arsenal of muskets. This ship was sent back to Tortuga to unload, with orders to rejoin the fleet.

L'Olonnois, with his fleet, sacked and burned several towns on the coasts of Central America and Cuba and put most of the inhabitants to the sword. More prizes were taken at sea, and at the end of two months there was so much loot on hand that the fleet sailed to the Isle de la Vache (Cow Island), south of Hayti, to divide 4,060,000 pieces-of-eight, jewels, silks, linen and other commodities of trade. In seventeenth century rating of exchange, assuming that the dollar might have existed then, one piece-of-eight was worth about $1.25. The fleet then sailed for Tortuga, where the available supply of rum and brandy was soon entirely inadequate for the celebration of the most successful buccaneer cruise in the history of buccaneering.

The inebriated pirates gambled their shares away with reckless abandon until the whole rested in the hands of a few. These secretively watched their chances to bury the loot in the valleys, coves and troves of Tortuga for future reference. Who knows how many of these treasure-burying pirates lost their lives on subsequent cruises, breathing the secret of the trove to their most intimate pirate friend at the last gasp or scrawling the rough chart on a bloody piece of paper as death stiffened the fingers? Who knows how many of these treasure chests lie buried under the jungle-grown soil of Tortuga today?

Save for about 200 illiterate Negroes, living in tiny settlements here and there, the island of Tortuga is deserted at present. Pirate history means nothing to these blacks.

Mutiny Splits Fleet

BUT to return to Francois L'Olonnois. His last voyage carried him to the Cuban coast with the largest fleet of all, where he robbed the Spanish turtle fishermen. Then he sailed to Nicaragua and sacked and burned coast towns. After more terrible crimes, he died the death of a pirate. Mutiny separated the fleet and the arch pirate, himself, was captured ashore by savage Indians on the coast of Cartegena, near Darien, and tortured to death by the redskins.

The mantle of the Frenchman was later worn by Captain Henry Morgan, a Welshman, who came to Tortuga and equipped a fleet carrying 700 men, mainly French and Walloons. Among Morgan's principal forays was the sacking and burning of the city of Panama; the complete destruction of a large Spanish fleet sent against him; the capture of the island of St. Catherine, and the seizing of the populous city of Porto del Principe in Cuba.

Captain Henry Morgan operated from Tortuga, provisioning and dividing treasure there, until Drake took Jamaica. He then established headquarters in that British settlement and "worked" his piracy from there.

Numerous other buccaneer leaders, who made their names dreaded on the waters of the Spanish Main and on the coast lines of the southern part of the New World after the "pilgrim pirates" set the pace, were known as Sawkins, Sharp and Coxon.

Teaching Women the Way Back to the Farm

By ROBERT H. MOULTON

IT WAS midsummer and the stifling heat of New York's downtown streets and pavements rose toward the tops of her tallest skyscrapers. In an office on the uppermost floor of one of these buildings a young woman left her desk, and went to the window in search of a cooling breeze. Far below, the hot, tired city, with its multitude of human pygmies crawling wearily about, lay scorching in the July sun. But farther out were the cool, inviting waters of the river and the sound, and beyond these, stretching away in panoramic fashion, Long Island.

Then, in her mind's eye the young woman saw a tiny farm cottage, shaded by overhanging trees, a flower garden, a little three-acre plot of other growing things, grazing sheep, a stream that gurgled its way to the sea—such a scene as she had often pictured to herself. The next day she resigned her position and started out, resolved to make the mental picture a fact. That was four years ago. Today this same young woman is manager of one of the largest estates on Long Island, at a salary five times that which she received as a stenographer, and her dream of the farm cottage is in a fair way soon to be realized.

The story of how this young woman, who, without any previous experience or knowledge of the subject, prepared herself for the responsible position of horticultural expert and manager of a country estate, including greenhouses, orchards and vegetable gardens, is an interesting one. In a degree it also is the story of the success of numerous other young women who have turned their faces from the monotony and grind of the city to the open country, and are earning a living from the soil.

The School of Horticulture for Women is in a historical old mansion.

Transplanting young flower plants in the greenhouse.

Setting out buds.

She had heard of the School of Horticulture for women at Ambler, Pennsylvania, a remarkable institution that is each year turning out young women qualified to run farms, to be florists, market gardeners, managers of fruit plantations and specialists as teachers of home and school gardens in public and private schools. With money she had saved and some slight assistance from her family, she was enabled to take the two-year course offered by the college. On graduation she was recommended to the owner of the estate who was seeking a manager. Her success in the new undertaking was immediate, and she undoubtedly could hold the position indefinitely—if she cared to give up the dream of the cottage and her own cares.

The horticultural school for women was founded some years ago by the club and college women of Philadelphia, and is under the direction of Miss Elizabeth Leighton Lee, who has not only been remarkably successful in making good farmers of her girls, but enjoys a national reputation as a horticulturist.

In America this is the first training school in horticulture for women. In England, and a few other European countries, schools of gardening for women have long since passed the experimental stage; they are holding a recognized place in the educational world. Graduates from these schools are managing large estates or holding responsible positions as directors of public or private gardens, managers of commercial work, or as consulting horticulturists and lecturers.

Miss Lee believes that a woman may earn a good income from the smallest piece of ground, provided she specializes in some particular branch of horticulture. If the women of England succeed, then there is all the more reason why American women should do so, she says. Because of the wastefulness in land here, there is a broader scope for the woman gardener.

The field of horticulture for women includes the raising of flowers, vegetable gardening, the growing of fruits, nuts and nursery stock, and in addition bee culture and chicken raising. While all these branches do not require especially strenuous labor, the question naturally arises whether women are physically adapted for such work as plowing, spraying and handling heavy boxes and barrels of fruit. They are not always strong enough to do such work, but this is not necessary, so long as they know how such things should be done and can direct the efforts of laborers.

Women have an instinctive love for growing things and get a keener enjoyment from cultivating than men. We have all seen how the busy housewife will coax and pet a few plants and make them grow despite the most unfavorable conditions, so it stands to reason that if a woman really loves the work and gives her time to it there is no reason why she should not succeed.

Making pear butter.

The school property at Ambler consists of 75 acres. About 20 acres are used for the school horticulture study and the remainder for crops. Much of that part used for horticulture is given to special plantations for practice and experimental work for the students. This includes an old apple orchard, a number of pear trees, young apple, peach, plum and cherry orchards, a vineyard of about 300 vines, a large variety of small fruits, flower and vegetable gardens, nurseries, greenhouses, hotbeds, cold frames, bee colonies and a poultry plant. Recognizing that constant practice throughout each season is essential to success in horticultural work, the school devotes a large part of the time to practice work in the growing of flowers, vegetables and fruits, each student planting and caring for a small plot of ground, under instruction, for which she is responsible. Theoretical instruction is given in botany, entomology, soils and horticultural chemistry. Training in the principles of simple carpentry is given, the students being taught to make cold frames, boxes, flats and various other articles needed in garden work.

The daily schedule at the school begins at 8:15, when the students go to the greenhouse for roll call and to receive instructions for the day's work. They are simply dressed: in winter, in woolen skirts and blouses; in summer, khaki skirts and smocks. One squad takes charge of the greenhouses, looking after the watering, the temperature, the fire, the cleaning of pots and beds, spraying for insects, and so on. Another squad will transplant seedlings; perhaps a third will make cuttings for propagation and wash the sharp sand in the propagating bed before putting in the cuttings. This work is done every three or four weeks, or generally after several plantings of cuttings. From these propagating beds hundreds of plants are raised, and they are always kept full of cuttings through the winter. It takes 26 days as a rule for cuttings to make good roots.

Other students plant seeds in flats and these flats are made in the carpentry class on Saturday afternoons. After the practical work in the greenhouse, lectures on different subjects are given until luncheon. After luncheon, outdoor practical work is done if the weather permits, either in the nursery, where pruning, budding and grafting is carried on; planting shrubs and small fruits; laying out the grounds by the landscape garden class; or planning vegetable gardens, individual flower beds, or poultry yards. At 4:30 p. m. the day is ended. In spring and summer the classes in botany and entomology go afield for specimens after lectures in these subjects, and study the birds in the near-by woods and fields.

A feature of the school in recent years has been the "Jam Kitchen." In this the products of the farm and orchard are preserved. In doing this the preserving class uses the latest recipes of the Department of Agriculture, and the same equipment.

A root cellar is another feature. Here are kept potatoes, beets, carrots, cabbage, onions, pumpkins and, in the late autumn, for protection against frost, eggplants, peppers, green and half-ripe tomatoes, squash winter pears and apples.

The harvesting of honey twice yearly is an interesting and profitable experience. The June honey of apple blossoms, basswood and clover is light in color and delicate in flavor. Many pounds of honey are sold each year. The care of the bees is all done by the students under an excellent teacher. Last year word was sent by telephone of a swarm of bees some distance away. Immediately a number of young women students started out in an automobile after the runaways. They found the bees, gathered in a half bushel of them, brought them home and safely housed them in another hive. Before morning, however, the bees had swarmed again, this time alighting on a high branch of an apple tree. Nothing daunted, the girls procured a tall ladder, cut off the limb and once more the bees were hived, this time to stay.

The bee incident is only one of many in which the girls are taught to meet emergencies such as will face them in their chosen profession.

Packing of specimen jars for exhibits and for customers provides keen competition, while the "seconds" are used by the large family that has to be fed thrice daily. A large storage cellar holds the harvest, and in the wintertime orders are packed and sent to various customers.

Setting out plants.

Usury, Destroyer of Ancient Roman Empire

People Fled to Barbarian Slavery to Escape Exactions of Money-lenders

'Twere long to tell, and sad to trace,
Each step from splendor to disgrace;
Enough—no foreign foe could quell
Thy soul, till from itself it fell;
Yes, self-abasement paved the way
To villain-bonds and despot sway.

SO SANG Byron of Greece. The downfall of Rome might equally have inspired the poet. By the middle of the fifth century the ruin of Rome was appallingly complete. Salvian, writing in 440 A. D., tells how the poorer classes in Rome actually fled to the Barbarians to escape from the extortionate taxes of the empire. It was not the only instance in history where the government which claimed to exist for the protection of the people, was bleeding them to death.

Pasquale Villari, in his "Barmarian Invasions of Italy," says: "Procopius describes the state of things in Italy in the year 538 A. D. For two years the land had been left totally uncultivated, and even the poor crops of sickly grain which sprouted spontaneously were often left to rot on the ground. The inhabitants of Tuscany had fled to the mountains where they lived upon acorns; the dwellers in Aemilia migrated into the Picenian territory, hoping to find sustenance on the Adriatic coast.

"But so great a dearth reigned there that 50,000 peasants were said to have suffered death from starvation. The same writer describes, from his own experience as an eyewitness, the manner in which they died. Their skin turned yellow from the overflow of bile, and adhered to their bones like leather, their flesh being all wasted away. Then the yellow tint changed to deep red, later to black. Their eyes glared like those of madmen, and thus these poor sufferers died. Even crows and other birds of prey left their shriveled carcasses untouched. Also if the starving wretches chanced to find any food, they devoured it so greedily and in such great quantities, that it killed them, their digestive organs being already destroyed by exhaustion.

"Things arrived at such a point that men sometimes became cannibals. Procopius mentions the case of two women who, being left alone near Rimini, gave shelter to travelers and killed them in their sleep in order to devour their bodies. He declares that they had already disposed of 17 victims in this manner, but the eighteenth escaped, and killed the women instead. One saw poor wretches crawling about in the fields feeding on grass like goats, and often being too weak to uproot it, they perished of exhaustion, and were left unburied on the ground."

The grandeur that was Rome had sunk to the very depths—to cannibalism itself. It remains to ask, What was the master-architect of this magnificent ruin? Byron sang:

This is the moral of all human tales:
'Tis but the same rehearsal of the past;
First freedom, and then glory; when that fails,
Wealth, vice, corruption, barbarism at last,
And history with all its volumes vast,
Hath but one tale.

Ferrero, equally eloquent and equally vague, says that the fall of Rome was the "greatest tragedy in human history." He deplores it as "the most appalling crisis of anarchy and disorder which was ever produced by a violent and corrupt despotism of brutal force despoiled of moral authority."

By JOHN BASIL BARNHILL

We tire of these pointless moral homilies, this eternal flood of obscurantist oratory, these cultured ambiguities which get us nowhere. Why do not our learned professors get down to "brass tacks"? Is it because their jobs are at stake? However that may be, for those of us who are not dependent upon the interest-bearing endowments of Yale, Harvard, Oxford or Cambridge, knowledge is indeed rich with the spoils of time and yields an unmistakable lesson. We can trace every step of that program of progressive degeneration carried out to the letter by the money-lenders of Rome and their faithful servants, the Roman politicians. We can determine the exact nature of the most malign conspiracy ever devised by the selfishness of man for the subjugation of his brother.

Plutarch tells us that the Roman politician was in the pay of the money-lenders. Other writers confirm his testimony that this pernicious partnership of pawnbrokers and politicians was willing, as Ruskin says, to "pawn the very cradles of the children." Against such a conspiracy omnipotence itself would contend in vain.

As early as 343 B. C. the usury question had become so serious that the Genucian Law forbade the taking of any interest at all. As the powers that be did not know or did not care to know the true technique of the abolition of interest, this law soon became a dead letter. Finally, after many attempts to curb the evil, in 193 B. C., 12 per cent (or, as some authorities say, 10 per cent) was declared to be the legal rate. This legal rate was honored more in the breach than the observance. Verres exacted 24 per cent out of the Sicilians. Brutus demanded 48 per cent from the Cyprians. Horace speaks of 60 per cent as quite common. Seneca, according to his enemies, sucked dry the provinces by his usury.

It is true there were many Romans who perceived that no society could by any possibility survive such excessive rates of interest and their denunciation was voiced in no uncertain tones. Cato Major pointed out that the usurer was branded by the Roman law as a greater evil than the common thief and he made the dishonesty of loans a ground for declining them as investments. Cicero quotes him as saying that "usury is a form of homicide."

Cicero ranks as unworthy of a gentleman the business of tax-gatherers or money-lenders because "they come into collision with the ill will of man" and he refused to invest his funds with banks. He represents Asia as full of all sorts of Italian merchants and money-lenders. Stearns in his "Influence of Wealth in Imperial Rome" says that it is probable that the extortions of the tax-gatherers and money-lenders were really greater than the extortions of the governors. Roman money-lenders were in Egypt long before Augustus' conquests. In 88 B. C., 150,000 Romans were massacred when Mithridates raised the standard of revolt in Asia Minor. The inspiring cause of these massacres is to be found in the intolerable extortions of the usurers and tax-gatherers.

Our researches seem to have led us to the original "Gentlemen's Agreement." When an impossible levy was laid upon the hapless cities of the provinces, a rich friend of the governor was always at hand, willing to accommodate the victim with a loan at 60 per cent. Asia Minor, with its rich cities, was always fair game for this brotherhood of thieves.

The case of Lucullus illustrates in a striking way the method by which the politician and money-lender co-operated for mutual advantage. Sent out as proconsul to Asia Minor, Lucullus tried to stand out against the rapacity of the money-lenders. He found parents selling their children, cities their art treasures and ancestral gods in order to meet the exactions of the money-lenders. Plutarch says that individuals were so tortured and beset by their Roman creditors that the very slavery they fell into was a relief. The province was groaning under the effect of Sulla's war fine of 20,000 talents—about $20,000,000. To pay this sum the provincials had turned in despair to the Roman money-lenders. In a few years usury had swollen this debt to $120,000,000. Lucullus struck off the worse demands of the money-lenders, and for this they never forgave him. Plutarch adds, "By their money's help, as they were very powerful and had many of the statesmen in their pay, they stirred up several leading men against Lucullus." Lucullus was finally recalled because he would not bow to the financial magnates.

Certain land reformers, quoting Pliny's saying, "Large estates have ruined the provinces and are ruining Italy," attribute the downfall of Rome to land monopoly. Such a conclusion betrays an astonishing simplicity. With rates on money at 60 per cent in the Roman Empire and with our Federal Reserve Banks declaring a semi-annual dividend of 74 per cent, the question as to what class of capitalists will finally absorb the entire wealth of a country is no longer open to doubt.

Rollin, the historian, had said: "Usury has always occasioned the ruin of the states wherein it has been tolerated; and it was this disorder which contributed very much to subvert the constitution of the Roman commonwealth and gave birth to the greatest calamities in the provinces of that empire." But this master-key, which would have unlocked all the secrets of history, has been religiously rejected by all the learned historians and interpreters from Bossuet to Mr. H. G. Wells, with the result that they have never stumbled upon the fundamental truth, "no, not even by accident," as Macaulay would say. If, as Shelley said, "the way to advance the world, is to stand by the truth," such historians are guilty of an intellectual crime of the first magnitude. In consequence, all history must be rewritten—there must be a transvaluation of all historical values.

The task, devolving upon humanitarians is a stupendous one, the emancipation of man from the unmerited miseries which poison every aspect of his life. Here is a Promethean mission demanding Promethean energy and consecration. If we can arouse the sleeping millions to a sense of the imminent danger and of their peremptory duty, the rapidity of our triumph will be equal to the greatness of our task.

And Today It's Not So Different

THE American City is in the hands of the loan shark.

Fifty years ago the city of Cleveland installed a new pump in its waterworks, laid water mains and made other improvements, at a total cost of $400,000. The city borrowed the money on bonds to pay for the work. Today, the city of Cleveland has paid $1,060,000 in interest on the original debt.

It must go on for 10 years more paying interest.

And it still has the original cost price of $400,000, every dollar of which is unpaid.

Two or three years ago, Cleveland ordered the erection of a public hall at a cost of $6,000,000. Utterly unmindful of the lessons of its costly experiences with interest, Cleveland raised the money to pay for the building by the sale of bonds. Fifty-year term bonds were negotiated.

When the time arrives for the payment of those bonds Cleveland will have paid nearly $20,000,000 for her public hall.

Attention was directed to the two striking examples above by G. E. Gesell, director of finance in Cleveland, one of the few men in public office in a great American municipality who seems alert to the dangers of financial ruin, which the bonding mania offers.

"No more important campaign could be waged than that of THE DEARBORN INDEPENDENT against the bonding evil," said Mr. Gesell. "Cleveland is suffering because of reckless bonding. But it is only one city among the many which suffer likewise.

"I believe in a pay-as-you-go policy for municipalities. Nearly all cities bond for schools, sewers and other improvements. If I had my way there would be bonding for nothing except public utilities. We build schools for the children, then we sell bonds to pay for those schools—the result is we place the debt upon those children themselves."

Tax laws of Ohio and conditions peculiar to Cleveland in a degree are responsible for the bonding troubles of that city. But in the main the same conditions are country-wide.

Early in American life, some holder of office conceived the idea that he could escape the political handicap of "high taxes" by the simple expedient of borrowing the money to run the office, leaving it to be paid in a year, in five years, in ten years—no matter when.

To postpone the day of reckoning, the simple little expedient of refunding the debt was adopted.

Thus the city of Cleveland in the water bond case mentioned at the outset of the article had sold 20-year bonds in 1872. The interest was paid. But when the debt was due in 1892, the city merely issued new bonds. In 1912 the process was repeated. Perhaps, it will happen again in 1932. But the interest goes on anyhow.

In some states, there are stringent constitutional provisions or municipal charter inhibitions limiting the amount of bonds which may be issued, and the purposes for which they might be sold. In others only the elastic consciences of municipal officials are limitations. Even in municipalities where so-called conservatism exists, there is frequently an arrogant generation of officials which rides roughshod over charter and law, in loading the taxpayers down with vast interest-bearing debts.

Cleveland happened to be one of the cities where bonding limits were ill-defined, and requirements for sinking funds to retire bonds at maturity were vague. The city awoke in 1920 to discover that millions of dollars of indebtedness had been incurred by the sale of "deficiency bonds," issued for the payment of operating expenses, for which no provision had been made in the regular tax budget. In other words, because the mayor and council neglected to raise one million dollars for policemen's or firemen's salaries, the taxpayers were penalized a million dollars in interest, plus the neglected million dollars in original salaries.

In 1920 the city discovered that approximately *sixty per cent of all the money raised was already obligated for the payment of the interest and principal on bonds, sold in years gone by.* Sixty cents out of each dollar, therefore, was being used to pay for improvements, many of which like the $400,000 water pump mentioned above, had worn out long before they were paid for.

Faced by the condition requiring the expenditure of the greater part of their taxes in payment of old debts, the 1920 generation of taxpayers took thought of the approach of the time when bond interest and principal would exhaust all the money available for taxation. Ohio like most states limits the amount of money which may be raised by taxation. To meet the situation, Cleveland made ironclad provisions for a sinking fund, whereby all bonds issued subsequent to 1920 must have interest and principal safeguards in annual sinking fund allowances. The bad financing of former years is still a sore problem.

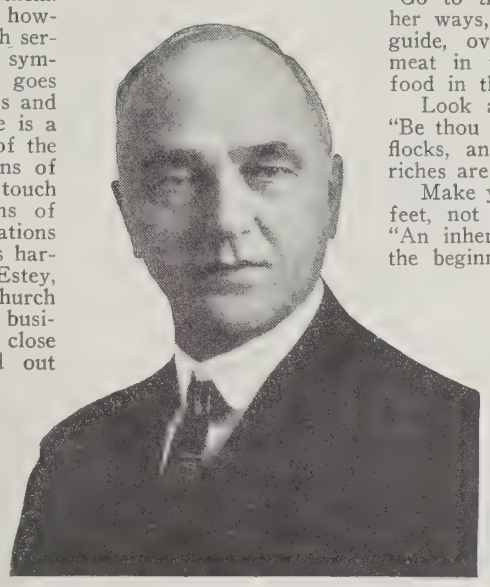
The present debt of Cleveland is approximately $93,000,000, about one-eighteenth of the entire valuation of the city.

Cleveland's discovery that interest and principal payments on old debts had obligated her for 60 per cent of her tax moneys is not an exceptional one. There is one city in Ohio, whose so-called fixed charges are said to be equivalent to 85 per cent of its budget raised for all purposes.

The story of Cleveland's peril from bonding is the story of nearly every large city in the United States. Her water bond refunding and her $6,000,000 public hall which will cost $20,000,000 are replicas of conditions in sister cities.

A Business Man's Preacher

He Mixes Trade Knowledge With Religion



By FRANK M. CHASE

A DEAL is heard from the pulpit about more religion in business. Likewise, much is said by well-intentioned business men to the effect that religion would get along faster if more of their methods were used in the churches. Both points, of course, are well taken. Meanwhile, the concrete instance provided by a Kansas church sheds clarity on the situation.

Between this church and the business life of the community are close and beneficial relations. These are not accidental, but the result of a mutual interest. On the part of the church, the pastor has made it attractive and helpful to the business men; while they, in turn, have responded with a generous interest in its welfare. The key to the situation, it is seen, is the pastor, whose results are not surprising once the man and his methods are revealed.

On hearing the Rev. Dr. Stephen Sewall Estey for the first time, a visitor to his church remarked that he seemed more like a business man fresh from his office than a regulation preacher. The remark was not without foundation, as in his presence and clear and direct exposition is much to suggest the dispatch of the commercial world. Quite naturally, business men like that kind of preaching, which alone might account for much of his hold on them.

His appeal to business men, however, neither begins nor ends with sermons. It is more personal and sympathetic. In the first place, he goes frequently among them; aloofness and he do not coincide, anyway. He is a member of the Rotary Club and of the Chamber of Commerce, by means of which he keeps in first-hand touch with the thought and conditions of trade; likewise, with its temptations and shortcomings. That business harbors moral rottenness is not, to Estey, reason for ignoring it. If the church is to exert any improvement on business, it must, in his opinion, get close enough to the subject to find out where the trouble lies.

DR. STEPHEN SEWALL ESTEY,
Pastor First Presbyterian Church of Topeka.

The business men, especially those affiliated with his church, naturally appreciate this sensible view. So it is not surprising that, along with a large family attendance, an unusual number of bankers and other business heads, judges, lawyers, and doctors, are regularly found in Dr. Estey's congregation.

Probably, Dr. Estey's most interesting connections with business life have been as a counselor and confidant. This, coupled with his close observation, has given him a clear discernment of business, which enables him to preach with a real appreciation of the problems confronting both employer and employe. He drives home his points by the force of simple language and numerous telling illustrations from secular life. As a result, his sermons are of very practical application to the daily task.

Illustrating this rather strikingly were two sermons which he preached on successive Sunday evenings recently. One was called, "Causes of Failure in Business," the other, "Guide Posts to Success in Business." Both were based on the Book of Proverbs, which he referred to as "the best business guide."

"Solomon was specially well equipped to speak to practical business men," he said, in opening the series. "He was not a preacher; he was a man of affairs with brains enough to see the moral laws which sweep through the world, and the ability to state them. Solomon was at the head of some pretty big business enterprises. He built two large palaces, a magnificent temple, and a law court; he fortified the cities of Jerusalem and Millo with vast walls and towers. In this work he employed 80,000 men to hew timber and cut stone, 70,000 men as carriers, and 3,600 men as overseers. These were large contracts measured even by the standards of present-day big business. They involved trade with a foreign country, and a big transport business by sea."

In the course of the two sermons, Dr. Estey brought out the following eminently sane rules of business, all of which are based on Solomon's teachings:

Don't love money more than character. (Prov. 22:1.) "A good name is rather to be chosen than great riches, and loving favor rather than silver and gold."

Don't go in debt. (Prov. 22:7.) ". . . .the borrower is servant (slave) to the lender."

Don't go on anyone's note or bond. (Prov. 11:15.) "He that is surety for a stranger shall smart for it; and he that hateth suretyship is sure."

Don't cheat with false measures and weights. (Prov. 11:1.) "A false balance is abomination to the Lord; but a just weight is his delight."

Don't corner the market on grain, or fruit, or coal, or any other commodity necessary to the life of the people. (Prov. 11:26.) "He that withholdeth corn, the people shall curse him; but blessing shall be upon the head of him that selleth it."

Don't get entangled in any get-rich-quick scheme. (Prov. 28:22.) "He that hasteth to be rich hath an evil eye, and considereth not that poverty shall come upon him."

Don't form a trust or any organization in restraint of trade. (Prov. 11:21.) "Though hand join in hand, the wicked shall not be unpunished; but the seed of the righteous shall be delivered."

Don't associate with evil men. (Prov. 1:10.) "My son, if sinners entice thee consent thou not."

Don't give way to sensual pleasures. (Prov. 21:17.) "He that loveth pleasure shall be a poor man: he that loveth wine and oil shall not be rich."

Be diligent in business. (Prov. 22:29.) "Seest thou a man diligent in his business? He shall stand before kings; he shall not stand before mean (lowly) men."

Consult and counsel with other people. Don't think you know it all. (Prov. 15:22.) "Without counsel purposes are disappointed; but in the multitude of counsellors they are established."

Keep your business affairs to yourself. (Prov. 13:3.) "He that keepeth his mouth keepeth his life; but he that openeth wide his lips shall have destruction."

Lay up something for the future. (Prov. 6:6-8.) "Go to the ant, thou sluggard; consider her ways, and be wise; which, having no guide, overseer, or ruler, provideth her meat in the summer, and gathereth her food in the harvest."

Look after details. (Prov. 27:23-24.) "Be thou diligent to know the state of thy flocks, and look well to thy herds; for riches are not forever....."

Make your children stand on their own feet, not on your back. (Prov. 20:21.) "An inheritance may be gotten hastily at the beginning; but the end thereof shall not be blessed."

Take time to make friends. They are necessary to business success. (Prov. 18:24.) "A man that hath friends must show himself friendly....."

Look for the good in people and things. (Prov. 11:27.) "He that diligently seeketh good procureth favor; but he that seeketh mischief, it shall come unto him."

Be generous in expenditures that are demanded for improvement and progress. (Prov. 11:24.) "There is that scattereth, and yet increaseth; and there is that withholdeth more than is meet, but it tendeth to poverty."

Give a tenth, or some larger portion, of your income regularly to the work of bringing in God's kingdom of righteousness and love on earth. (Prov. 3:9-10.) "Honor the Lord with thy substance, and with the first fruits of all thy increase. So shall thy barns be filled with plenty, and thy presses shall burst out with new wine."

Put your religion into your business. It pays to do right. (Prov. 12:3.) "A man shall not be established by wickedness; but the root of the righteous shall not be moved."

Dr. Estey was born at Calais, Maine, in 1861, and spent his early life in that vicinity. He attended Oberlin College, from which he graduated in 1883, but without definite preparation for the ministry. While in college he had taught country schools during the winters, to earn money toward continuing his education. So, on graduating, he turned to teaching at once, serving as a superintendent in Ohio and later in Kansas. After teaching several years in the latter state, however, the boyhood inclination to preaching ripened into conviction. He was ordained in 1895, and, giving up a $1,600 school position, he accepted a pastorate at Independence, a small city in the Kansas oil fields, at $1,000 a year. In 1900 he was called to the First Presbyterian Church of Salina, Kansas, and to his present pastorate in Topeka four years later.

While Dr. Estey is the mainspring of the excellent work that his church is now doing, doubtless there is truth in the point which he makes, that the church has made it possible for him to give good service.

"What the people of a church want, they must expect to pay for—at least to a certain degree," he said. "The reason I can belong to the Chamber of Commerce and the other organizations with which the men of the church like to see me affiliate is because they pay me enough salary that I can afford to do so. Of course, the contacts gained through such associations are helpful, but the minister on a $1,000 salary cannot take advantage of them. Neither can he do many more things that would make him a better preacher, and more satisfactory to his congregation. Because I am able to do it, and feel that I need to, for instance, probably I buy as many books to read as any man in Topeka. To preach acceptable sermons it is just as necessary for the minister to keep himself well informed as for the teacher and editor, and probably his hearers do appreciate his efforts to make his words interesting. I believe I should, were I in their places."

Things in the Making

Wall Paper

IN THE manufacture of wall paper, the "blotching machine," as it is called, performs the first operation. A web of blank paper is set in a reel behind one of these machines. The free end of the paper on the web is pulled forward and placed between two cylinders which drag it into the machine, where a roller, part of which is working in a "color pan" filled with thin paint, puts a large quantity of color on the paper. A set of flat brushes, called "jiggers,' work rapidly back and forth, working this coloring matter in and spreading it evenly over the surface of the paper, so that when the cylinders at the rear end of the machine drag it out, it is thoroughly painted in water color on one side.

As it comes from the blotching machine a workman takes the free end of the paper and wraps it around a stick, which is carried up an incline by two parallel endless chains. After 18 feet of the paper has run out, these chains pick up another stick which lies across them and bears a paper on it. This last stick chases the first one up and gains on it until only a foot behind, when it stops gaining and both travel along, maintaining that relative distance with the paper between them looped down until it nearly touches the floor.

One hundred other sticks do precisely as the second one did, and the result is that there are soon 100 loops of paper, each loop containing 18 feet.

The elevated railway of parallel chains on which the sticks from which the paper is looped are traveling turns corners of the building at will, and soon the blotching machine has run the whole web out, and it is hanging in loops over a system of steam pipes, which dry it so fast as it moves along that it is perfectly dry before it reaches the farther end of the chain railway, where a boy with a reel winds it back into web form again.

First Sketched on Paper

THE designs are first sketched out on paper and then transferred by an ordinary process on the faces of rollers made to suit the size required—an 18-inch design, for instance, requiring a roller six inches in diameter. Perhaps the design requires printing in 12 colors (which is the highest number ordinarily run). To do this 12 rollers would be prepared, each having the design on it and each of a size exactly equal to that of the others.

When the rollers are all prepared the artist will direct skilled workmen, who are with him, to fix one up to take the brown, another red, another yellow, and so on. Let the brown color serve as an example for all.

The workman takes the roller to his bench, where he puts it in a vise and goes to work on it. Every bit of the design, which is to be in brown, is traced out for him and he reproduces it in relief on the roller with his bronze wires and rods and ribbons which he drives into the hard wood so solidly that they stick there as if they had grown. The brass wire can be given any ordinary shape by drawing it by machinery through a hole of corresponding shape in a steel bar. This is the way the roller, which will print in brown, is first fitted up. When it is finished, it bears on its face in raised brass, fragments of leaves and parts of birds and sheaves of wheat, and little and apparently unnecessary and unshaped points of metal, all of which at the proper place and time will put the brown coloring in exactly the place where the designer wants it to go.

When the roller has had all its share of the design hammered into it, it is taken to a turning lathe, where the face of all the brass work is struck on one side by pumice stone and on the other by a file, and gradually brought down to perfect smoothness and evenness and the exact size needed.

Fast Press Used for Work

ALL the other rollers are treated in the way indicated, each getting its share of the design hammered into its face in brass work and each afterward being reduced to smoothness and the proper size by the file and pumice stone.

When the rollers have been prepared they are taken to a press, which consists of a large cylinder, the width of ordinary wall paper. Around the bottom and sides of this cylinder are grooves into which the rods on the ends of the rollers fit, the faces of the rollers just touching the cylinder when they are in position.

To each of the rollers comes from below an endless cloth band, which works upward from a color pan in which the coloring matter, in the shape of a thin liquid, to be used on the particular parts of the design carried on the roller in question is lying.

Each of the rollers is registered, that is, turned so that the portion of the design on it will strike exactly in the spot necessitated by the relative position of the other rollers. When all is thus arranged and the paper, which has previously passed through the blotcher, is conducted between the cylinder and the first roller, the machine is started. The cylinder and the rollers revolve at once, each of the latter printing its color just where it was intended, and a steel scraper, called a "doctor," lying at each of the endless cloth bands, sees to it that not too much liquid from the other pans gets on the rollers. The press works very rapidly, throwing off 10 rolls of the paper a minute, each roll containing 16 yards.

Developed and Undeveloped Negro Literature

Writers Desert Great Field of Folk-life for Propagandism

By ERIC D. WALROND

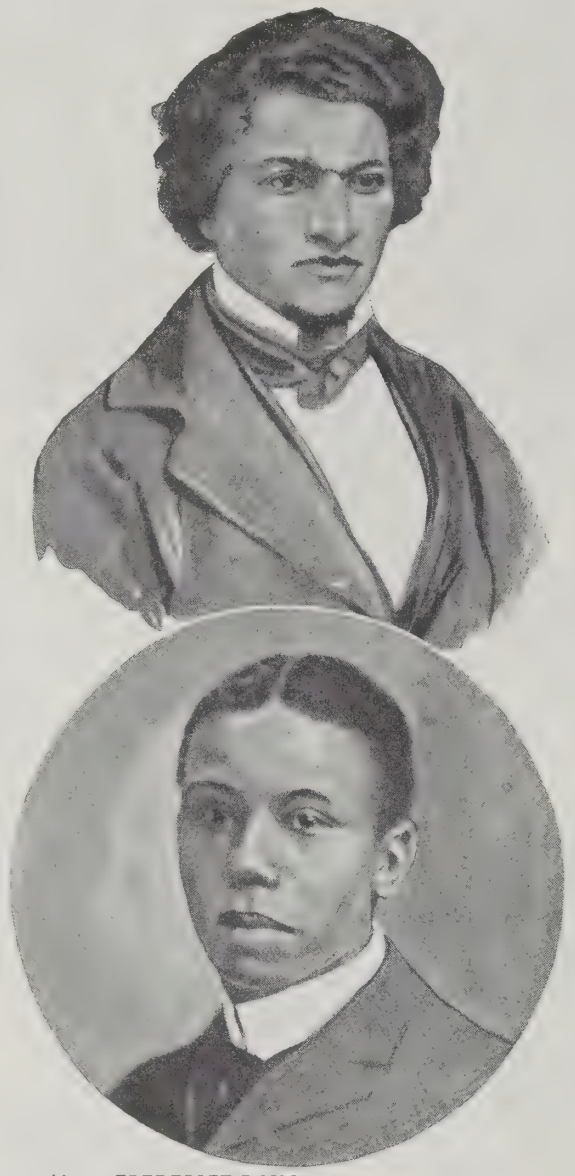
PERHAPS the first noted defense of the Negro as a scholar and writer was made by Abbè Gregoire in his "De La Littèrature Des Negres," published at Paris in 1808. Prior to that the nation wavered as to the immortality of the "sentimental letters" of Ignatius Sancho and the "melancholy poems" of Miss Phillis Wheatley. Yet, as far back as the seventeeth century, a Negro chimney-sweep in Holland, Beronicius, "exhibited the phenomenon of a poetic genius." In Latin, Beronicius wrote two volumes of poetry entitled, "Georgar," dealing with the peasants and the nobility. It was translated into Dutch verse, and was reprinted in eight volumes at Middlebury in 1766. On the Middlebury edition, the print which serves as a frontispiece represents Apollo crowning the poet chimney-sweep with a laurel wreath.

In Silesia, at about the same time, a mulatto servant at Glats "excited the public attention by his romances." Also, two Ethiopian girls, Anne Yearsley, a milkmaid at Bristol, and Greensted, a servant at Maidstone, are represented as poets of rare merit. Other Negro poets who aroused public attention at this time were Castaing, a Turk, whose "pieces ornament different editions of poetry"; Cesar, of North Carolina, and Francis Williams, a Jamaican. Likewise, writing in Latin, Williams wrote the "Ode Ethiopissa."

Of the Latin prose writers of color of this period, Capitein, of the River St. Andre, a painter by instinct, was probably the greatest. On admission to the University of Leyden, Capitein wrote a "Latin Dissertation on the Calling of the Gentiles," reputed to be rich in erudition, which was translated into Dutch and ran into four editions.

Away from the realm of poesy, one stumbles upon a characteristic form of Negro literature—a form handed down to Chestnutt, DuBois, and others. Othello's "Essay Against the Slavery of Negroes" paints in "strong colors the grief and sighs of black children, fathers, brothers, and husbands, dragged from the country which gave them birth." Alongside may appropriately be put the tragic tales of Ottobah Cugoano, a native of Agimaque, whose reflections on the "Slave Trade" and "Slavery of Negroes" are standard bits of Negro literature. "The Interesting Narrative of the Life of Alaudah Equiano or Gustavus Vassa," published at Edinburgh in 1792, is the most famous of these. In many respects Vassa's story resembles the "Kaffir Kraal" pen-pictures drawn by Santie Sabalala in "Adventure." It is significant to note that Vassa was obliged to obtain affidavits from an admiral, an army captain, two old maids and half a dozen married women in London to prove to the publishers and the public that he was the author of the work. Not only does the book reveal Vassa as a born story-teller, but as a stylist and descriptive artist of classic charm. Of it, Bishop Gregoire said: "This work is written with that naïveté, I had almost said that roughness, of a man of nature. His manner is that of Daniel DeFoe in "Robinson Crusoe." Vassa also wrote a poem of 112 verses on "Disquietude Arising From a Choice of a Religion."

Ignatius Sancho was born on a slave ship on the way to Cartagena. After his death in 1780, a fine edition of his letters in two volumes was brought out. Jefferson, while condemning him for his imagination and eccentric march, acknowledged that he had "an easy style, and happy expression and that his writings breathe the sweetest effusions of sentiment." Here, indeed, was an artist, an adventurer, who knew life as only a Negro slave knew it; whose "epistolary style," says Abbè Gregoire, "resembles that of Sterne." "Sometimes he is trivial—sometimes, heated with his subject, he is poetical; but in general, he has the grace and lightness of the fancy style. He is playfully witty, when between the tyrannic empire of fashion on the one hand, and health and happiness on the other, he places the man of the world irresolute in his choice."



Epidemic of Tales of Slaves

NOTABLE among the slave narratives of this sort is the "Experiences of Zamba," a Congoese king who was sold into slavery at Charleston, South Carolina. Published at London, in 1847, it provoked a stream of slave tales that literally cluttered the market. Some of them were mere sketches, of pamphlet size, and it seemed to be the fad of the day for every escaped slave to sit down and write his reminiscences.

Of Phillis Wheatley, the African poetess, I can do no better than to quote from Mr. Arthur Schomburg's introduction to the "Poems and Letters of Phillis Wheatley."

"We offer no defense as to the merits of Phillis Wheatley's poems, but we are going to rest our case solely on the class of poetry of her day. During the period in which her poems were published the American Republic had not yet been born. It was in its first stage of embryonic life. The poems to George Washington bring her within the range of living witnesses of the creation of a nation; in this poem we have noticed for the first time the words 'first in peace.'

"Phillis Wheatley's first poem was published in 1770, five years before the dawn of the American Revolution, and nearly 30 years before the dawn of the French Revolution and the birth of German idealism. That is to say, young Phillis wrote before the mighty outburst of the human spirit which gave rise to Goethe, Schiller and Heine in Germany, and Wordsworth, Byron, Keats and Shelley in England. Her poetry was a poetry of the eighteenth century, when Pope and Gray reigned supreme; and that her poetry compared favorably with the other American poetry of her age is by no means to her discredit. There was no great American poetry in the eighteenth century and Phillis

Above—FREDERICK DOUGLASS, when he was 30 years old. Below—PAUL LAURENCE DUNBAR.

Wheatley's poetry was as good as the best American poetry of her age . . . . Phillis Wheatley is a jewel—priceless to the literature of the Negro in America."

Of the poets from Phillis Wheatley to Paul Laurence Dunbar, James Weldon Johnson, in his recent "Book of American Negro Poetry," tells us that many showed marked talent, but barely a half-dozen demonstrated even mediocre mastery of technique. And yet there are several that deserve attention, George W. Horton, Frances E. Harper, James M. Bell and Alberry A. Whitman. The educational limitations of Horton were greater than the others; he was born a slave in North Carolina in 1797, and as a young man began to compose poetry without being able to write it down. Later he received some instruction from professors of the University of North Carolina, where he was employed as a janitor. He published "The Hope of Liberty," in 1829.

Mrs. Harper, Bell and Whitman would stand out if only for the reason that each of them attempted sustained work. Mrs. Harper published her first volume in 1854, but later published "Moses, a Story of the Nile," a poem which ran to 52 closely printed pages. Bell, in 1864, published a poem of 28 pages in celebration of President Lincoln's Emancipation Proclamation. In 1870 he published a poem of 32 pages in celebration of the ratification of the Fifteenth Amendment to the Constitution. Whitman published his first volume, of 253 pages, in 1877; in 1884 he published "The Rape of Florida," an epic poem written in four cantos and done in the Spenserian stanza, and which ran to 97 closely printed pages. The poetry of both Mrs. Harper and of Whitman had a large degree of popularity; one of Mrs. Harper's books went through more than 20 editions.

We now come to Paul Laurence Dunbar, dean of American Negro writers. Born in Dayton, in 1872, Dunbar worked as an elevator operator; his education was limited. His first volume, "Oak and Ivy," was published in 1893 at his own expense. Peddling his own poems became so distasteful that he swore he would prefer to go unsung rather than do it again. And he did not have to. William Dean Howells took an interest in him and wrote an introduction to "Lyrics of Lowly Life," which appeared a few years later. In his dialect poems, irresistible in humor and pathos, and his short stories of southern Negro life, a master of his art; Dunbar depicted the Negro as he is. Yet that does not mean that he was not capable of classic prose. Realizing that a Negro poet is expected to sing the songs of the cotton fields in the language of the cotton fields, Dunbar wrote dialect. He is the author of four novels, "The Love of Landry," "The Fanatics," "The Sport of the Gods," and four volumes of short stories, "Folks from Dixie," "The Strength of Gideon," "In Old Plantation Days," and "The Heart of Happy Hollow." Volumes of verse were "Lyrics of the Hearthside," "Lyrics of Love and Laughter," and "Lyrics of Sunshine and Shadow."

There is only one Negro writer with whom we may compare Dunbar, and that is the late Charles W. Chestnutt, the novelist. Not so very long ago a book reviewer for a New York paper told us he thought "it was time for the Negro to return to the age of Chestnutt; that there is so much bite and venom and vituperation in his work." Exactly. But why Chestnutt? Why not Dunbar? Author of "The Conjure Woman," a volume of short stories; "The Wife of His Youth and Other Stories of the Color-Line," a biography of Frederick Douglass, and three novels, Chestnutt not only did not interpret the soul-movements of the black race, as Dunbar did, but he was—especially in "The Marrow of Tradition"—a purpose novelist, a propagandist. Indeed, Chestnutt, from his lofty pedestal, saw the red monster of race prejudice in all its sordid colors and leveled his javelin at it. It is regrettable for there is not the slightest doubt that Chestnutt knew how to write, and wrote trenchantly.

Another Negro novelist who fell by the wayside is Dr. W. E. B. DuBois, editor of the *Crisis*. It is no idle cant to state that Dr. DuBois is one of the most brilliant prose writers in America today. Oh, if he would only stop writing history and sociology and stick to the art of fiction! Then critics like Charles Hanson Towne would not be able to talk—as he does in his review of T. S. Stribling's Negro novel, "Birthright"—about the decadence of black writers; of the inability of the Negro to write a great novel about himself. But DuBois, a wizard at words, is probably serving his race best in his present position. Among his exhaustive writings are "John Brown," a biography, 1909; "The Quest of the Silver Fleece," a satirical novel, 1911; "The Souls of Black Folk," a series of classical essays, 1903; and "Darkwater," a collection of essays, prose poems, and short stories, 1920. "The Comet," in the last volume, is a short story of the highest artistic merit.

Works of Modern Poets

COMING down to the modern poets, William Stanley Braithwaite, literary editor of the Boston *Transcript*, is foremost. Although a poet of beauty and distinction, most of Mr. Braithwaite's time is taken up with the editing and compiling of the annual, "Anthology of Magazine Verse." Besides being the author of two sturdy volumes of verse—"Lyrics of Life and Love," 1914, and "House of Falling Leaves," 1908—Mr. Braithwaite edited the "Poetry Review of Cambridge," 1916; collected and edited "The Book of Elizabethan Verse," "A Book of Georgian Verse," and "The Book of Restoration Verse." He is general editor of the "Contemporary American Poets Series." Of the Negro poets today, there is James Weldon Johnson, Georgia Douglas Johnson, Claude McKay, Theodore Shackleford, Leslie Pinckney Hill, Fenton Johnson, and others, whose reputations are secure.

It is well to speak also of Professor Kelly Miller, author of "Out of the House of Bondage"; Dr. William H. Ferris, author of "The African Abroad"; Hubert H. Harrison, author of "When Africa Awakes"; Mrs. Maud Cuney Hare, author of "The Message of the Trees."

There is the "Revolutionary Group" that is pulling away from the culture and imperialism of the old guard, striking out and conquering new fields. There is Rufus Perry, son of the author of "The Cushite," whose "Sketch of Philosophical System," is not only the work of a serious thinker but a skillful writer; J. A. Rogers, a young West Indian, whose "From Superman to Man," "As Nature Leads," and "The Approaching Storm," are used by the University of Chicago in connection with its sociological and anthropological studies; and Miss Angeline Grimke, whose "Rachel" is a promise of greater things in the drama.

It is important to note that an attempt is being made to nourish and perpetuate it. At 181 West 135th street, New York City, is Young's Book Exchange. Its owner, Mr. George Young, is engaged in collecting rare and out-of-print books by Negro authors with the ultimate view of republishing the worth-while ones. If Mr. Young's plans mature the public will have access to works like Dr. Edward W. Blyden's "Christianity, Islam and the Negro Race," "Life of Banneker, the Afro-American Astronomer," "Frederick Douglass's Story of His Life," "The Works of Professor Kelly Miller," and books of that sort.

One reason why the Negro has not made any sort of headway in fiction is due to the effects of color prejudice. It is difficult for a Negro to write stories without bringing in the race question. As soon as a writer demonstrates skill along imaginative lines he is bound to succumb to the temptations of reform and propaganda. That is why it was possible for Alexandre Dumas and Pushkin in Russia to write colorlessly; and it also explains why Negro poets and novelists in Spanish-America are not limited by the narrowness of color. It is not a strange thing to find educated Negroes objecting strenuously to stories that do not depict the "Higher Form" of Negro life, stories whose characters are not all Negroes.

Friends of the Negro, like Miss Ovington, sigh at the vast patches of color open to the Negro fictionist—the soft rhythmic stream of life in the Negro Quarter. From Dixie issues the murmur of voices—the melodies of black millions—crying for a dusky satirist, a DuBois, to pen a tragic epic on "The Glory and Chivalry of the South."

Shuberts Exploit Divorce Film Others Spurn

Vaudeville Producers Capitalize Scandal in Beauvais Picture

LEE SHUBERT

LEE AND J. J. SHUBERT, directors of the Shubert vaudeville chain of theaters, have capitalized the Stillman divorce case scandal by exhibiting in motion pictures Fred Beauvais, the alleged Indian guide-lover of Mrs. Stillman.

Further than that, they exhibited the film after an organized association of motion picture houses had taken a stand against it in the hope of saving the motion picture industry from the severe censure that its members felt would surely follow the presentation of any picture in which the central character had received as much notorious publicity as has Fred Beauvais.

The action of the Shuberts was unique in motion picture presentation and is particularly worthy of note because motion picture interests were seemingly willing to cast aside what appeared to be certain huge profits rather than blotch against the already well-bespotted reputation of the film industry. And their efforts seemed successful (for the film stood small chance of being shown, at least in high-class houses) until the Shuberts took a hand in the situation and agreed to sponsor its presentation.

The film, which is called "The Lonely Trail," was made by the Primax Film Corporation, of 1540 Broadway, New York, probably for no other reason than because of the notoriety that had attached itself to Beauvais through his connection with the Stillman case, the object being, many people think, to exploit to the fullest the reams and reams of filthy innuendo and open charges of illicit love that have been printed about Beauvais since the case first slipped through all the secrecy safeguards that had been placed about its journey through the courts and startled the society and financial world by splattering itself upon the front pages of practically every big newspaper in the United States. No other reason for his being made the central figure in a motion picture can be conceived. He is not an actor and his only "fame" rests on the charges that have been made against him by James Stillman and the resultant infamous publicity. There is not one chance in a hundred, unless he shows unusual talent, that he will ever be seen as the leading player in another motion picture, for there is nothing about him, outside of the fact that he is charged with being the father of Mrs. Stillman's child, to draw people into a theater to see him. He is like a comet in the firmament. Every once in a while one of them appears and disappears never to be heard of more. No attempt is being made here to pass upon either the guilt or innocence of Beauvais, but he himself must realize that he is not an actor.

As the picture neared completion, rumors that permission to show it in New York State would not be granted began to be heard, for it was said that the State Board of Censors would refuse to pass it. In due course of time, though, that body did pass it on the ground that the picture contained nothing that was offensive. In other words, the state board held that, even though the film had a notoriously "famous" person for its central figure, the situations, subtitles, and so on, were not out of good taste and the whole thing should, therefore, be passed, the question of whether or not Beauvais was a notorious person being of no concern to the state.

The Theater Owners' Chamber of Commerce, however, which numbers among its members the B. F. Keith interests, all the big Broadway film palaces and the conclusions of which regarding the fitness of a film to be shown are often followed by the other big organizations of the country owing to the fact that its members are of such prominence as exhibitors in the metropolitan section, immediately took up a position antagonistic to the showing of the film. It had taken the same position in the case of the film starring Clara Hamon after she was acquitted of the murder for which she was tried, maintaining that the showing of such films left the motion picture industry open to attack by those interested in the establishment of censorship boards.

As soon as the film was completed, the matter was brought before a business meeting of the organization and there was a discussion of whether the association should approve it, and the views expressed were that it should not be exhibited. The secretary gave out its conclusions in the following words:

"None of our members will display the film, although there were no formal resolutions adopted against it. The members, however, expressed themselves very definitely regarding the showing of this picture or, for that matter, of any picture in which the chief purpose is to exploit an individual whose only claim to fame is that he or she figured in some sensational episode. We do not care to assist in obtaining cheap notoriety for anyone."

Confronted with this opposition, "The Lonely Trail," or any other film that had only a character in a sensational case as its main attraction, did not seem to have a very good chance of being shown and its makers were in a quandary what to do, while many persons who hope for better things in motion pictures, rejoiced that exhibitors had developed sufficient foresight to put a curb upon such productions. It really began to appear as though "The Lonely Trail" would not be shown at all.

Then, it was suddenly announced that the Shuberts would exhibit the film in their vaudeville theaters, beginning at the Forty-fourth Street, New York, with the other houses in the chain to follow. It did not matter to them, it would seem, whether Beauvais had ever acted in a film or on the stage before to prove that he had talent. It did not matter to them that the Theater Chamber of Commerce had frowned upon the film for the reasons stated. They saw only the fact, it would appear, that he had been connected with a notorious case and, as a result, would probably draw the curious. The same persons would like to see the whole Stillman case enacted upon the screen or stage but, fortunately, public opinion would not permit it. With their keen minds they perceived that there were many highly emotional, if not hysterical, women and girls who would want to see Beauvais for no other reason than that he had been described as the woodland and clandestine lover of one of the most beautiful and richest women in American society. They perceived that these people would not go to see acting, for if they wished to see good acting they would attend other theaters where recognized film players could be

J. J. SHUBERT

viewed. In other words, they perceived the fact that nine of ten persons would see the film because of the prominence of Beauvais in the Stillman scandal and that any one who showed it would capitalize the morbid charges and accusations in that famous case.

The Sunday press matter sent out to the newspapers for the Forty-fourth Street Theater even boasted of the fact that Beauvais was on the bill, the exact reading being as follows:

"The Forty-fourth Street Theater boasts an unsurpassable bill this week, beginning tomorrow (Monday) afternoon, where two headline acts, in addition to a feature film called 'The Lonesome Trail' starring the Indian guide, Fred K. Beauvais, comprise the main part of the week's attraction. Nat Nazzaro and his band heads the bill, with the Rigoletto Brothers running a close second.

"Interest centers about the first presentation of 'The Lonely Trail,' a motion picture starring the much discussed Indian guide who figures in the famous Stillman divorce case, Fred K. Beauvais. By arrangement with Shubert Vaudeville this picture will be shown in New York only at the Forty-fourth Street Theater and after its engagement there it is to be seen as a feature of the Shubert Vaudeville theaters out of New York. It is worth recording that the film itself was passed by the censorship board of the state. The story itself is a straightforward one of love and romance and has absolutely no objectionable features as many motion picture theater owners have endeavored to make the public believe. For this week only, that is, while the picture is one of the features of the bill, the doors will open 45 minutes before the scheduled time, the picture being shown four times daily, at 1:30 and 4:45 in the afternoon and 7:30 and 10:45 at night. In other words, the picture will be shown twice at each performance. The photoplay is in five scenes, which are laid in the Canadian wilds. It was made by the Primax Picture Corporation and is being released exclusively in the theaters playing Shubert vaudeville."

Whether or not the public will accept the film remains to be seen, but, regardless of that the fact remains that the Shuberts, seeking money, exploited the most nauseating divorce scandal of recent times.

Legends of Creation Haunt Mountain Wilds

Concluded from page 7

The hoot owl and horned owl went together. At the hollow tree the fire was burning so fiercely that the smoke nearly blinded them, and the ashes carried by the wind made white rings about their eyes. They had to come home without the fire, and with all their rubbing never were able to get rid of the white rings.

Now, said the priests, no more of the birds would venture to the burning tree, and the little racer snake said he would go through the water, and bring back some fire. He swam across to the island, crawled through the grass to the tree, and wiggled through the small hole at the bottom. The heat and smoke were too much for him, however. He crawled blindly about over the ashes until he was almost on fire himself but managed by good luck to escape through the same hole, but his body was scorched black, and he has been the black racer snake since. Besides, he has ever since had the habit of darting and doubling on his track, as if trying to escape from close quarters.

When little racer snake came back, the climber snake offered to go for the fire. He swam over to the island, and climbed up the tree. But the smoke choked him. He fell into the burning stump, and before he could climb out of it he was as black as the little racer. Since then he has been the great black snake. The council again convened, but birds, snakes and four-footed animals each presented some excuse for not going. When dejection was uppermost in the council, female bravery again came to the front.

The she water spider—not the one who resembles a mosquito, but the other species, with black downy hair, and red body stripes, which can run on the top of the water, or dive to the bottom—spun a thread from her body, and wove it into a bowl, which she fastened on her back. Then she crossed to the island, and made her way through the grass to the burning tree. She put one little coal of fire into her bowl, and came back with it. Since that time there has been fire in Unknown America.

Gradually, the living things fashioned the wildest part of the Southern mountains into a comfortable place of abode. A man and a woman appeared. The priests forgot to mention the details of whence they came. They did say, however, that the man and woman were brother and sister, who spoke the language of the living things who were their neighbors.

For a time this brother and sister lived happily. Then they began to quarrel. The sister concluded to live alone, and she began to walk toward the east. Her brother followed, but the sister went steadily ahead, without a glance behind. The Sun took pity on the brother, and asked him if he wanted his sister to return and live with him. The brother said he did.

In front of the sister the Sun caused a patch of the finest huckleberries to spring up. She passed them without notice. Farther along the Sun put a clump of fine blackberries in her path. But she walked around them. Other fruits were placed before her, but she continued on her way.

Suddenly, the sister saw before her a patch of large, ripe strawberries, the first ever to appear in Unknown America. She stooped to gather a few. As she picked them she glanced toward the west. Memories of her brother came to her and she hesitated. She sat down beside the strawberry patch, and the loneliness for her brother grew. At last she relented, gathered a handful of the ripest berries, and started back.

This is, in part, the aboriginal explanation for the strange appearance of things in Unknown America; and in part it explains the origin and continuance of some of the outlandish customs that prevail to this day in that region.

Story of '49 to Be Given by City in Pageant

Sacramento, in Week Beginning May 23, to See 20,000 Persons in Big Celebration

THE largest and longest pageant ever attempted will be given by Sacramento, capital of California, from May 23 to 28. More than 20,000 persons from every county in which gold has been found in California, and from every city and town which has had anything to do with the gold discoveries, will take part. The city, which has nearly 70,000 inhabitants, will be the stage which will be called "The Days of '49," and on which a committee of 1,000 men and women is now at work, while more than 500 contractors, carpenters and laborers are erecting buildings for the affair. Fifty engineers have planned mechanical effects for the pageant, and 2,000 ladies of the capital city have organized the Days of '49 Club, to wear the costumes of 75 years ago.

The old city—or rather the village of 1850, from which the present city sprang—is being reproduced on the water front, true to all the details of a rare daguerreotype made in that year. Within the city, on a tract of land embracing nearly 20 acres, is being erected a complete replica of the old mining camp of "Hangtown," now known as Placerville, also taken from a daguerreotype of 72 years ago. In still another part of the city is being constructed an exact copy of Sutter's Fort, the central point of the greatest gold rush the world has ever seen, and also the cradle of California history for more than a decade.

Statue of James W. Marshall, pointing to the exact spot on Sutter Creek, in which he discovered the first gold found in California, on January 24, 1848, starting the greatest gold rush the world has ever seen.

Historic K street, which was the forest trail along which the first buildings in Sacramento were erected many years ago, will be converted into its pristine appearance, by the erection of false fronts on the modern buildings, extending over the sidewalks to the streets, while automobiles, motor trucks and street cars will be barred from the street, to add to the illusion of the past. The hotels have agreed to use six and eight-horse stages and ox-wagons for the week, in place of their motor buses, in meeting trains and in transporting guests about the city. A fund of approximately half a million dollars has been raised from the various gold-producing sections of California, and it is planned to have the mining camp, Sutter's Fort, the old village of Sacramento, and the reconstructed K street open perpetually, day and night, throughout the pageant, just as the mining camps of the "roaring forties" never closed.

The pageant will reproduce the days of the gold rush, with the exception that city, county, state and Federal officials have agreed that not a drop of intoxicating liquor of any kind shall be allowed. There will be saloons, gambling houses, dance halls with dancing girls, and everything that went to make up a first-class mining camp 75 years ago. The games of chance will be shown in operation, but real money cannot be played on them. Plenty of chips and counters will be provided free of charge for all who care to play, but there will be no prizes and no actual gambling, though one may win or lose all the free chips he cares to play.

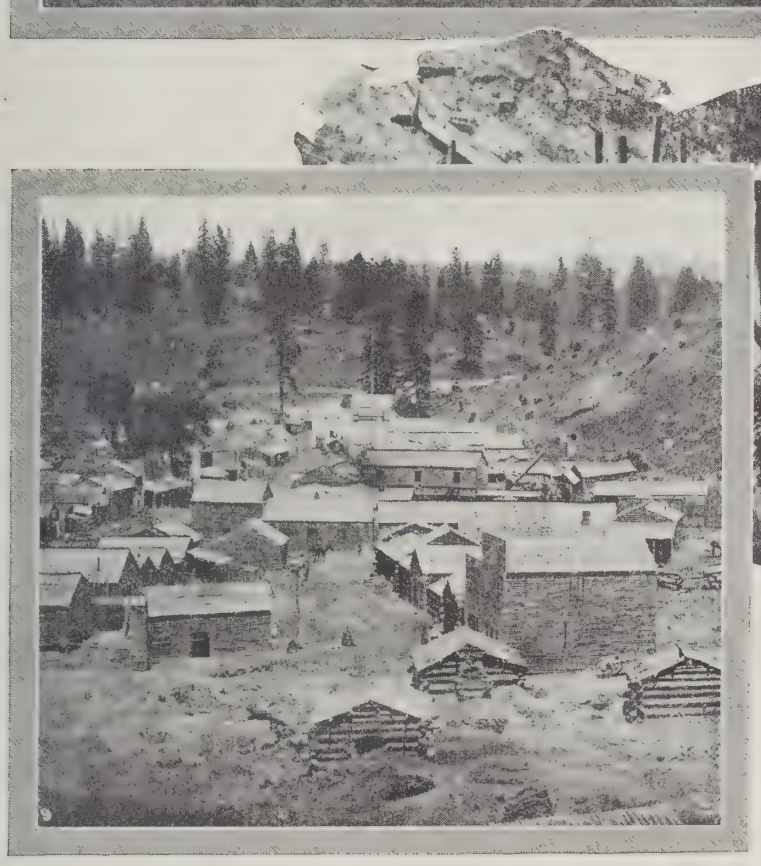
Prominent men of Sacramento and other cities of Northern California will be the "bartenders," "gamblers," "dance-hall keepers," merchants and other characters of the mining camp, and the leading women will have bevies of society girls with them in the dance halls and at other places throughout the pageant. More than 7,000 children of both sexes from the public schools are being trained in various dances, which they will contribute to the pageant. A humorous feature is the "stunt" performed by 200 prominent business and professional men of Sacramento, who, meeting together the morning of St. Patrick's Day, had clean shaves, and then agreed to let their beards grow until after the pageant. These bearded men will play the parts of miners, prospectors, "gunmen" and sheriffs, in the pageant.

There will be special characters representing Captain Sutter, John C. Fremont, James W. Marshall, who discovered gold in California; Kit Carson, and a score of other men prominent at that time in the history of California. Historic buildings of such one-time centers of life and activity as "Slug Gulch," "Dutch Flat," "Chinese Bend," "Hell's Acre," "Roaring Gorge," "You Bet," and many another—all very real names in the winning of the West—are being erected as nearly as possible like the originals, and Sacramento looks like a logging camp with all the timber brought in to erect the buildings of other days.

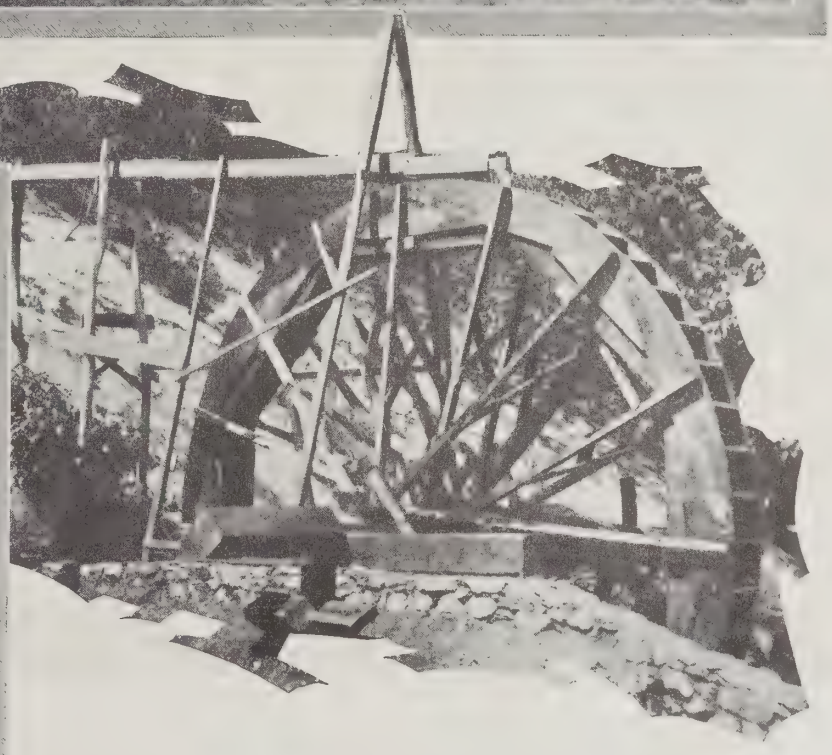
It is planned to reproduce the inaugural ball at which Governor Barnett, the first governor of California, was inducted into office. This will be the occasion for an outpouring of the society folk of Northern California, the men clad in the long frock coats, expansive trousers, chokers and high hats of those days, and the women in the costumes of our grandmothers.

A practical feature will be an exhibition of all known forms of mining and of the separation of gold from its ores. An artificial mountain is now being constructed, with trails, tunnels and shafts in it. Gold-bearing ore has been brought in, and the tunnels and shafts are being lined with it, so that the miners may be seen at work. The ore is brought out, in both the old and the new ways, and handled in old hand-crushers and by a modern stamp mill. Placer mining—the original form in which gold production was carried on in California—will be shown from the days of James Marshall and the old-time sluice-boxes and cradles, down to the huge dredgers now employed in the Sacramento valley placer fields.

More than 1,200 separate and different relics and mementoes of the early days in the California gold fields, ranging from the small cannon which Captain John Sutter brought with him, and which protected Sutter's Fort from the "hostiles," down to pens used by Sutter, Marshall, Governor Barnett and other prominent men, have been collected from descendants and other relatives of these men, and are being brought together in Sacramento, to exhibit in the replicas of the old buildings of the mining camps.



The pageant commemorates the discovery of gold in California. The early history of California is a part of Spanish tradition, but the story of its settlement is one of boundless faith in an unknown land, tireless energy, and measureless courage. Junipero Serra, whose only weapons against hunger, thirst and the Indians, were his faith and his crucifix, founded San Diego, Monterey, Los Angeles, San Francisco, and 17 other centers, first of religion and then of population, or, at least, by his faith inspired their founding. But of that particular district where gold was found, and where the Sacramento valley now bears an agricultural industry greater than all the gold ever discovered in its streams,



The contrast between the main street of Sacramento in 1849 and the capital of California today is marked indeed. The historic K street, which was the main trail on which the city was founded three-quarters of a century ago, is to be redressed to represent that ancient main thoroughfare, by putting false fronts on the present business houses, and carrying them out across the sidewalks. The hotels will use six-horse stages and ox-wagons to carry their guests to and from the railroad stations, instead of the motor buses now used.

Top—Two thousand ladies of Sacramento will wear the costumes of the women of the days of '49 in the pageant. Below, left—The original mining camp of Hangtown, now known as Placerville, from a daguerreotype made in 1850. This town is eight miles from the spot at which Marshall found gold in 1848, and was called Hangtown because of the number of horse and ore thieves hanged there by the Vigilantes. This entire camp is being reproduced, exactly as seen here. Right—First water wheel ever built in California. It will be reproduced.

Father Serra knew nothing. For half a century after this great priest passed away, this valley with its slow-moving river was an unknown wilderness of wild animals and even wilder Indians. Ships had been passing into and out of the Golden Gate for 63 years, when Captain John Sutter, a Swiss by birth, came roving through it, and, hearing of this *terra incognita,* asked for a guide up the Sacramento River.

But there was no guide, for the simple reason that no one ever wanted to go up that stream. So Sutter, taking three white companions and seven or eight Kanakas from the South Sea Islands, set out in a comparatively small boat to find—somewhere on the rim of the 450 square miles of San Francisco Bay—first, the mouth of the Sacramento River, and, second, what lay inland along that river. Doubtless he little dreamed that he was to be the indirect cause of the greatest gold discovery of history, but after eight days' search, he found the mouth of the river, and there encountered two friendly Indians, who guided him to the mouth of the American River, where he landed, close to the present site of Sacramento, August 12, 1839, the same year in which he had arrived in San Francisco.

There he erected a square house, from the large sun-baked bricks known as *adobes,* and, because of the apparently hostile attitude of the Indians, surrounded it with a high, thick wall of the same material. The two small cannon he had brought in his pinnace were mounted on opposite corners of the wall, and the hut became Sutter's Fort, destined to play a most important part in the history of California. Captain Sutter's transparent honesty, even justice, and often-shown bravery soon won the Indians to be his friends, and he settled down to a prosperity possible only in such a golden age where there was no competition. Governor Alvarado, learning of Sutter's control over the Indians, gave him a vast tract of land, the boundaries of which never were accurately defined, and, as white men learned of his success and flocked to him, he gave and gave and gave them lands for themselves, until, as the early records, written in Spanish, tell, he had left for himself "not more than 50,000 hectares"—approximately 120,000 acres. At one time he had 50,000 acres in wheat and barley; 15,000 head of beef cattle, 9,000 horses, 12,000 sheep, and the largest trading business between Alaska and Panama, on the Pacific coast. He bought Fort Ross and the Bodego holdings from the Russian governor of Sitka, for $35,000 in gold, and, in 1844, feeling crowded at Sutter's Fort, started Sutterville, three miles below his first settlement.

In 1848, Captain Sutter saw the possibilities in the production of sawed lumber for sale to the ranchers who had no facilities for getting out such lumber for themselves. So he sent one of his workmen, a carpenter named James W. Marshall, to wander through the hills on the Sutter lands, and find a forest, suitably near water to furnish power for a mill. Marshall found such a spot, near what is now Coloma, on Sutter Creek, flowing into the south fork of the American River, and set to work building the mill, into which he had put $25,000 of Sutter's money, when, idling down the stream one Sunday afternoon, he spied a glittering stone in the brook. It was gold; he found others; the brook bed was paved with these nuggets. In two hours, Marshall was a rich man. But he was an honest man, and he told no one of his find until he conferred with Sutter. The two pooled their interests, but the secret would not keep. Dozens came and found gold, in other streams; the placer beds were discovered; hundreds came. Then the news spread eastward, and thousands rushed around the Horn, across the Isthmus of Panama, over the plains of North America, and the great Sutter rancho was swept by a lawless horde of gold-seekers, who carried with them every laborer, every workman, every Indian the captain had on his place.

The crops rotted in the fields. The gold-hunters killed and ate the cattle, or stole and rode the horses. No help could be obtained, and, worse than the rest, the gold-seekers lured away the Indians, who had paid no attention to the finding of the gold, with whisky, so that Sutter could get no help from them. In a few months, he who had been the richest man in the West faced bankruptcy. Gathering together his few belongings, and leading the half hundred Indians who had remained true to him in spite of the white men's whisky, he went to Mormon Island, but, crowded out there, he moved again to the upper reaches of Sutter's Creek, but the Argonauts followed him there, and, finally, he fled to Hock Farm, on the river, and from there went East shortly afterward and died.

The story of Sacramento is a continuation of the story of Sutter's Fort. The first survey was made in 1848 by Captain William H. Warner, U. S. A., and, in 1849, the citizens of the new town celebrated the Fourth of July in a grove of oak trees where the capitol building now stands. Sacramento then started the growth which has given it nearly 70,000 inhabitants.

BRIEFLY TOLD

A Chicago landlord is building a 33-flat building having a perambulator stall with lock and key for each tenant.

Swimming from Colonia, Uruguay, to Buenos Aires, recently, an Argentine student made a new record. The distance was 27 miles. The swimmer was in the water 24 hours, 30½ minutes, beating the previous record by 30 minutes. This is believed to be a world's record for endurance swimming.

A black-headed albatross followed a steamship across the North Pacific for 3,000 miles without once furling its wings. It started from a small island near Japan and when the ship was 1,900 miles from the nearest Alaskan port, it turned abruptly and flew toward the west.

Thousands of Chicago families plan to move "under canvas" May 1, in an effort to meet the rent problem. Tents will be pitched on vacant lots and forest preserves, according to the Chicago Tenants' League. Tent manufacturing concerns have agreed to supply tents at wholesale prices.

A once famous bar in Chicago is now a library with books for theatrical folk and downtown night workers and pleasure seekers.

Three loafers, taken in a raid on a pool room in Omaha, were sentenced in police court to spend 10 days in the public library. Should they fail to spend eight hours there each day, they will be taken to jail for double the sentence.

There was an actual decrease of 2,817 in the number of tenements and apartments in New York City between 1919 and 1921, although the population of the city increased by 230,000 during that period.

Grape growers of Southern California have named a new town Volstead.

A baby man-eating shark, hungry and vicious, was found as a stowaway in the bilge of a ship put in drydock in New York for repairs.

London University, with an enrollment of 20,000 students, makes the claim of the largest attendance of any institution of learning in the world.

A helium-filled dirigible is easier to handle in the air. According to government experts, who have been experimenting, the helium-filled ship is steadier and moves with greater momentum than an airship filled with hydrogen. Helium gas is twice as heavy as hydrogen and has 92 per cent of its lifting power.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

Thousands of dollars are extracted by beggars each night from the New York City theater crowds. Earnings up to $60 an hour have been reported.

In a contest at Shanghai between a Chinese adept in the use of an abacus and an American adding machine salesman, the abacus was badly worsted. The many spectators present were impressed with the superior accuracy and speed of this American product and its ability to compete successfully with its great rival.

The late King Charles paid 31 per cent interest for a loan of 75 days' duration, on the crown jewels of Austria-Hungary, according to allegations made in a suit by a Paris jeweler.

More than $2,000,000,000 is invested in the cocoanut industry. Many crushing mills have been established in the Dutch East Indies, the Philippines, Australia and French Oceania. By crushing the oil from the nut where the nuts are grown freight is saved and the fresh copra yields a better product. The residue left after pressing the copra for oil is called "poonac" and commands a high price in Europe, as live stock food.

Travelers report that the price of a room in a first-class hotel in Vienna is anywhere from 5,000 to 40,000 crowns a day. Forty per cent of this goes to the municipality. A similar tax is imposed on the charge for heating rooms and there is a tax of 10 per cent on the cost of meals.

The Secretary of the Navy has announced the closing of naval radio stations to public use for broadcasting speeches, lectures or any form of non-official communication, excepting musical programs to be picked by radio telephone. The issuance of the order followed the use of the naval radio service by members of Congress in addressing their constituents on political subjects.

Ownership of two or more dogs is a "luxury" in Germany and heavy taxes are imposed under a new schedule.

Identifying cows by the prints of their noses, in the same manner as the police system of identification by fingerprints, is a new method employed by the University of Minnesota to prevent unscrupulous dealers taking advantage of pedigreed live stock.

A canary bird wholesaler in Omaha has the trade-mark, "Living Music Box," stamped under the left wing of each bird with indelible ink. He places a high value on this trade-mark.

Three hundred thousand francs was paid for a one-cent British Guiana stamp, issue of 1856, black on carmine, sold recently at an auction sale of the famous Baron Ferrari collection in Paris. The state tax of seventeen and one-half per cent added to the cost price made it the highest price ever paid for a stamp in France.

Truck patches are being worked by many of the 155,000 idle anthracite workers of Wilkes-Barre, Pennsylvania. Cabbages and potatoes are the favorite crops.

Penrhyn Ceduraeth, Wales, pays no taxes. A movie promoter rents the town hall on shares and when the balance sheet was presented recently it was discovered that the municipal movie had done away with the necessity for levying any taxes for the coming year.

The people of the United States will present to Brazil a statue of liberty on the one hundredth anniversary of the Republic of Brazil. The statue is of bronze. Liberty, holding a branch of laurel in her right hand, with her left, supports the flags of the United States and Brazil intertwined with laurel and palm. At the base are figures of George Washington and Abraham Lincoln, representing America, and Rio Branco and José Bonifacio, representing Brazil.

Fraternal beneficiary societies obtain more than 1,000,000 members annually, according to the secretary of the National Fraternal Congress of America, which has a membership of nearly 10,000,000 persons, and embraces 93 organizations.

Indians of Arizona are becoming proficient in golf. With the natural swing begotten of loose joints, the strong muscles of the Indian drive far and straight, and approach with great accuracy.

Twenty French soldiers were killed and many wounded recently when, while searching for hidden areas, a spade struck the detonating mechanism of a hidden mine in Silesia.

CHRONICLER OF THE NEGLECTED TRUTH

Twelve Years Ago Hamilton, Ohio, Abandoned This Gas Plant But People Today Pay on 33-year-old Bonds

IT IS a bitter lesson, indeed, that the good people of Hamilton, Ohio, are learning. The trap, into which their city executives of a generation ago permitted the city to become entangled, today has tightened on its victims, the taxpayers of Hamilton. The story of conditions in that charming Ohio city is here told. There are countless other American municipalities in a plight much the same.

Hamilton: A City in Distress

Learning the Lesson Interest Teaches

By EMERSON ROBINSON

THIS is a story of a city in financial distress, a city suffering the torment of operating on insufficient funds, of an administration reaping the whirlwind of economic indifference and shortsightedness for 20 years and more; of a city that, this year, is paying *more in interest than it is* on its bonds, and *four times as much* for its sinking fund as it is for current expenses!

But here are the figures of 1922 for Hamilton, Ohio, a thriving, prosperous city of 40,000 in the southwestern part of the state:

Total bonds due and payable	$121,525.75
Interest on bonds	133,023.60

In 1923 of a total of $221,144.79, more than half, or to be exact, $128,119.04 will be paid as interest.

These figures explain in brief curtailed activities of the municipality and frantic efforts of officials to devise new and unusual methods of raising funds to meet current and necessary expenses. As one official put it, the judgment day is here, maturing obligations have to be paid, let city hall function as best it can, for the old, old habit of issuing new bonds to pay old ones cannot be further countenanced. Usury has exacted its toll.

There was raised for municipal purposes for 1922, the sum of $429,283.36 of which $321,962.50 had to be paid to the sinking fund trustees to meet bonds and interest and for a reserve. In addition, the people had voted that $34,400 should be devoted to park purposes. This left a balance of $76,820.83 to pay for police and fire protection, garbage removal, street cleaning, salaries of officials, and so on, which ordinarily would require $322,424.26.

So came the first of the year and the day of reckoning. A large number of policemen were laid off and those who were kept were put on a 12 instead of an 8-hour shift; a proposal to close half the fire houses was dropped when firemen agreed to work for half pay until such time as arrangements could be made to get funds to resume full payment; collection of garbage *for which the people had already paid one tax* was discontinued; cleaning of streets was stopped, several offices abolished, and other economies effected.

Removal of refuse was placed directly on the householder and it is estimated that $50,000 is being spent, where formerly the city paid $36,000. The sewer gang, when not employed in their proper work, cleans streets. The service director assumed the duties of market master, and the city engineer is doing the job of the former superintendent of streets.

But with all these economies, it still was found that the city could not operate even for half a year on the money in hand.

So to maintain the police and fire departments at their former standard a new tax was evolved—the occupational tax—in which every business is assessed as a business and a specified sum for each employe. A license was put on pool rooms and soft drink parlors.

With this additional money the city will "get along" for a large part of the year, but if you ask any official what will be done when the treasury is empty, you will get a shrug of the shoulders. They don't know but, as a government is necessary, some way may be found—will have to be found.

It has been suggested that the people may be asked to vote a special tax levy. Such a proposition was voted on last fall when the crisis of this year was foreseen, but it lost by an overwhelming majority despite the fact that it was supported by the dominant political party.

This situation has been caused by bonds and their concurrent evil, interest, and failure to have any definite plan to meet them. Such a word as "amortization" was never thought of or discussed.

Hamilton Bonds for Gas Plant

TO UNDERSTAND properly the conditions of 1922 it is necessary to go back 33 years to 1889. Hamilton, fortunately or unfortunately, owns its own gas distributing system, electric light, and waterworks plant, all of which are supposed to be self-supporting. But if they are not self-supporting and earnings are insufficient to meet bonds and interest, the city must make up the deficit.

Bonds for $100,000 and bearing five per cent interest were issued in 1889 for the construction of the gas plant, including building, ovens, and so on.

The bonds were to run for 30 years. When they came due the city had paid out *in interest alone, without one cent on the principal,* the sum of $150,000. And it was found, too, that there was not enough money to redeem the entire issue; there was only $75,000 to apply to the debt. Result: $25,000 in refunding bonds were issued and of these $15,000 remain to be paid!

The plant, a modern one at the time, was built near the end of North Third street. It was abandoned as a gas manufacturing plant more than a decade ago and has since been used, more or less, for storage purposes. It is a typical weather-beaten, neglected old shop, long since forgotten and unused.

Its history was a stormy one, too long for review here. Its construction was the outgrowth of exorbitant rates charged by a private corporation and which made gas available only to the well-to-do. The Supreme Court of the United States ruled on the legal right of the city to build and thus established the validity of municipally owned utilities in America. By 1908, through various causes, the plant had got in such shape that something radical had to be done. But just then, opportunity, in the guise of natural gas, knocked. It was welcomed, and in 1910 was first boosted into the city's mains.

But the people today are paying for a plant erected 33 years ago and abandoned 12 years ago.

The electric light plant was built in 1894 from the proceeds of a bond issue of $100,000 and payable in 1918. It is the story of the gas bonds over again. There was not sufficient money to make complete payment so refunding bonds for $35,000 were issued, and of this $20,000 still is due. And Hamilton has paid out in interest on the first issues more than $125,000 and is still paying!

The waterworks plant was built in 1883 and bonds for $350,000 were issued. Records prior to 1904, when the sinking fund board was organized, are incomplete or lost, and it is difficult to get payments of interest and bonds prior to that date. They were issued to come due in different periods, the last in 1915. Then you have the same story. Insufficient money, so refunding bonds for $115,000 were issued of which $80,000 remains to be paid.

And Hamilton is still paying bonds and interest on a plant erected 39 years ago! And the end is not yet. The interest charge alone, it is freely admitted, has exceeded the cost of the improvement.

The figures cited above are for the original investments only. Since the first installations there have been extensions of service and shop improvements without end. Some of these have been paid out of the "earnings" of the plants; more by bond issues.

From 1904 to 1921 inclusive there has been paid the following amounts for bonds and interest:

	Bonds	Interest
Electric light plant	$ 91,000.00	$155,667.00
Waterworks plant	154,000.00	291,996.25
Gas plant	34,000.00	157,135.85
Totals	$279,999.00	$604,799.10

Some of this was paid from receipts of the plants; but the taxpayers have had to dig down in their jeans to make up a deficit which totaled $463,533.54.

These are facts of finance. They are not intended as arguments with reference to municipal ownership. As to the utility of the plants themselves, the following statements are made:

The construction of the gas plant resulted in cheaper gas, consequently making a convenience for a greater number of people.

No charge has been made against the city on the books of the electric light plant for lighting the streets of the city.

Water for fighting fires and public uses has been furnished free. Even schools were given water for many years and only now are meters being installed so that a proper charge can be made. A bill for the last six or seven years has been presented to the school board since the present crisis developed and will be paid. It amounts to about $12,000.

Here is another instance:

In 1913 a disastrous flood swept through the Miami Valley and Hamilton got the brunt of it. One bond issue followed another to meet the emergency. There was one in particular which deserves special notice.

This was for $100,000 at five per cent to remove debris and mud from the streets. The first lot of $10,000 falls due in 1938 and $10,000 each year thereafter until all are paid.

Paying—and Paying—and Paying!

THE interest charge on this one issue alone amounts to the amazing total of $147,500. In other words, *the people of Hamilton will pay $247,500 for less than two months' work, the original cost of which was much less than half that sum!*

An interesting side light here, however, develops. In 1912 the Black street bridge needed repairs. Bonds for $12,000 were issued and are now payable. The interest is about $6,000. But in 1913 the bridge was washed down by the flood. A suspension was swung across the river to accommodate pedestrians. Now a magnificent structure costing close to half a million dollars has been erected. But the bonds and interest for the repairs have to be paid!

Under a state law in effect for several years, cities of Ohio were permitted to issue bonds to pay current expenses—deficiency bonds. Hamilton, like many others, took advantage of this law. On September 1, 1920, bonds for $88,206 were issued and seven months later $160 000 more in bonds were put on the market.

Now for this year, the city has to set aside $41,699.53 to pay the interest and maturing bonds!

The total indebtedness of Hamilton now, including the city plants, but exclusive of special assessments, is $2,807,288.35. And there's going to be paid in interest before the debt is wiped out $1,164,845.20. Of the bonds, $465,000 were issued to pay other bonds.

This situation of 1922 is a vivid illustration of the financial trap which awaits the community that puts its trust in bond issues.

When there was no money in the sinking fund to meet bonds, more bonds were issued. Scant attention was paid to the dates when they fell due, and less to the overload of interest.

It has been the custom for years for the sinking fund trustees to find out the amount of bonds and interest due the following year and then certify the amount to the city. Sometimes they would get it; sometimes not, or it would be found that it would mean an extra tax-load. Then the bonds either would be refunded or paid out of the reserve of the board. This reserve ultimately was practically exhausted by unexpected demands.

What "Easy Way Out" Has Done

HERE are two examples of these demands: There were issued during last year special assessment bonds for more than $700.000 for sidewalks, sanitary sewers, paving, and so on. For some unexplained reason, it was not found possible to certify these assessments against the property owners in time for the first collection of taxes last December. The first installment of more than $70,000 and interest of more than $43,000 has to be taken care of by the sinking fund. A city cannot afford to default.

In 1918, the city plants failed to turn over a cent for payment of interest and bonds and the amount due, $63,075, had to be paid from the sinking fund reserve.

Under a state law now in force, it is impossible for cities of Ohio to issue bonds other than serially. If this law had been in force 20 or even 10 years ago, Hamilton would not now be in a financial tangle. Or if provision had been made when bonds were issued to retire them when due, there would still be a different story to tell.

"The easy way out" has enriched bond buyers and impoverished the city, insofar as the present tax rate is concerned. It is costing more to meet debts than to pay expenses.

The increase in sums raised for all purposes, exclusive of schools, has been phenomenal in the last 10 years. In 1912, for instance, $183,157.84 was paid into the city treasury. This year, $429,283.33 will be paid in, *of which $321,962.50 goes for interest and bonds.* That is, three-fourths of every dollar goes for debt; and of this a large proportion will not reduce the debt at all, but only pay accumulating interest.

That there is no local relief in sight for the next four years at least is agreed, for in that period Hamilton will pay in interest alone, $487,727.92, and an additional $794,403 on the principal. This on the present indebtedness; if more bonds are issued, the situation will be worse.

If any relief is forthcoming it will have to be from an additional tax rate voted by the people, or a new law by the state legislature giving such power to officials.

And Hamilton today is occupying a city hall that has been used since the mind of man runneth not to the contrary. It has been condemned so often by state fire department officials that the public has forgotten the count. But taxpayers can point to it with pride: it's paid for!

The turmoil of 1922 is regarded by many as a godsend to the community.

It had the effect of directing the people's interest to their public business.

It has forced efficiency and economy; employes have been notified in simple, plain English, that unless they report for duty on time and give a full day's work for a full day's pay, they'll lose their jobs.

It has necessitated a more businesslike manner in retiring bonds and conducting city affairs.

Hamilton is a good city, a manufacturing town. Its municipal plants are of great value, its school system second to none, its streets better than in most municipalities.

The people have had their lesson in usury. They've learned it well and it has cost them dearly.

Proud of Their City Hall: It's Paid for

The Slang-Ridden Nation

THE duel between Youth and Age goes on. "But Youth," said a parent the other day, "has ceased openly to fight, he now throws out a smoke screen of new words and new phrases and father and mother are lucky if they even recognize the drift of the conversation on the morning following the night before!"

Is he wrong?

It is safe to say that in the 146 years of the American Republic there has been no such despoliation of clear and clean speech as now rages. Beginning in the cities it is radiated by newspapers who care more for sensation than for culture, and soon the young of the smallest town bandy the distortions about.

There is more in the craze—if fortunately it is a craze—than mere coinage of words and phrases and the attributing of different and sundry meanings to old words. According to the discerning men and women, whether old or young, the slang of today bespeaks decadence of morals, loose thinking and a striving after effect in the nerve-racking race for something new and startling and emotional and sensational.

At a dinner the other day, a college graduate explained to some of his friends that he might as well have been among the Hottentots or in Patagonia for all his understanding of the language at a party he had just attended.

"I'm a non-skid, so put on the Houdini," said one young lady to him. And another, "I suppose you are one of those dreadful beagle hounds?" And still another, "I'm mother's best excitement eater, fluky and no storm-and-strife." And so it went.

To say that such language is merely a striving after effect is a mild way to explain the situation. It is generally a sad attempt to appear brilliant, witty and clever. But it is also an emulation of the race track and the underworld and the pool rooms and the vagabonds. For many, if not most, of the phrases used by the red-lipped, flesh-exposed, short-haired young women of today and the pasted-down and combed-back-haired young men of today, originated among thieves and the bootleggers.

It is, of course, true that every trade and every profession and even the home has its words coined or perfected to mean definite things. That is a different kind of slang than the cheap talk that glories in its forbidden and reprehensible use of English.

Step over into slangdom and listen:

"Slang it for a while" in your own street car, or on the bus, along the beach or in the park. The following is due to such an experience. The scene is on a bus in New York, which might well be termed the slang factory of the nation: "Across the aisle was a Ritzy Jane with a kippy red hat. At the next stop a poor fish came up the stairs with a cane in his hand and a roving eye. He piped the Ritzy Jane, and spotting her for a heavy-necker, flopped alongside.

"'Where's that little piece of tin?' was his opener, referring to the emblem of the shifters. Turning to face him squarely she handed him this:

"'Mooch, you poor boob. Pull that boiler factory stuff over in Eighth avenue. Take the air now before I call for the Barney with the dime box.'

"'Excuse me stepper,' he replied in a soft voice, 'butt me a nice look, and I'm out of the picture.' But he didn't move and at Fifty-ninth street they were apparently ready to pet."

And that is a fairly understandable description of speech as it was a few days ago. There will be an entirely new set of words to express the sex lure by tomorrow. The slang is but a symptom of the disease that is eating at morals. It is a more dangerous symptom than the first syncopated music of a decade ago, but who will say that the former has not done its share to produce the latter?

Writers of histories may be able to see it more clearly in the future but it is not unlikely that they will begin their chapter on the moral decadence of America by a description of the keying up of the emotions that began some 10 years ago. Almost immediately came the popular song, then the senseless song of mere rhyming words with syncopated music. Then the eccentric dances, the Bunny Hug and the Grizzly Bear (how long, long ago that seems now)! Then came the modern dance craze and the call to "jazz 'em up." A certain class answered that call and weak-minded, addled brains have invented the slang of today to express their fuzzy thoughts."

The ultra modern "sport" of today is a back-number unless he can contribute something original to the jargon. There was a time when one man carried the responsibility for most of the current slang. Don't you remember the "Billy Baxter Letters"? But now there are thousands of Billy Baxters all seeking for something new in language. The flapper craze and the shifter are but products. They are merely a result of the breakdown clearly evidenced by the slangy trend of the times.

The youth are not wholly to blame. They don't with premeditation go out and invent devices of shocking effect. Far from it. They learn by precept and example.

John J. Tigert, United States Commissioner of Education, in a recent address before prominent educators, remarked that what we needed right now was "the old-fashioned virtues of honesty, justice and decency. If we cannot teach these virtues along with modern thought, then we had better dismantle our splendidly equipped institutions and return to the old log schoolhouse."

New, Beveridge and Indiana

THE significance of the Indiana senatorial primary does not inhere so much in the selection of Albert J. Beveridge as in the defeat of Senator New. It becomes apparent from a review of the situation that Senator New would have been defeated by a candidate much more ordinary than is Mr. Beveridge, and that thus Mr. Beveridge's nomination is very far from insuring his election.

The reported preparation of the Administration at Washington to receive Mr. Beveridge may prove to be prematurely confident. Mr. Beveridge has anything but an easy road before him in the election, not by reason of having particularly strong personal opposition in the Democratic candidate, but by reason of Mr. Beveridge's probable reluctance to prove to the satisfaction of the plain people of Indiana that, if sent to the Senate, he will not perpetuate certain conditions which Mr. New's vote, among others, has assisted to erect.

Mr. Beveridge did not definitely repudiate the actions and elements for which the people of Indiana repudiated Mr. New. And it is scarcely possible that Mr. Beveridge will be allowed to progress very far in his campaign without being compelled to come out plainly on certain definite issues of the past, which are bound also to become issues in the future.

Until the campaign has reached that stage, and until Mr. Beveridge's frankness or evasion has given his final measure in this well-staged return to political activity, the situation can be summed up thus: Indiana has repudiated New, using Beveridge as the necessary instrument; but in so using Beveridge, Indiana has not committed herself, even by inference, to his election.

Appreciates the Situation

MR. T. Y. SMITH, president of the Dartow, Georgia, bank, retiring president of the Country Bankers' Association of that state, at the sixth annual convention at Atlanta, said:

"The year which has just passed will long be remembered by all of us of the banking fraternity for many reasons. Not only has it brought trials and problems beyond any we have previously experienced, but we have witnessed the passing of many accepted standards, and in some respects the old signposts we have been wont to follow now point in the wrong direction . . . .

"We have seen agriculture in its greatest distress; we have seen the values of farm lands and crops shrink and fade almost to the vanishing point . . . .

"Surely there is a lesson in all of this for us country bankers—several lessons.

"The first is that we have no real agricultural banking system. Our country banks come nearest to being agricultural banks, but as long as we are dependent on short-time or demand deposits, and short-term borrowing for funds, we cannot become real banks of agriculture; and surely the experience we have just passed through has amply demonstrated to the most skeptical the pertinent fact that an adequate system of finance is as essential to the prosperity and well-being of agriculture as it is to commerce."

There is hardly need for extended comment. That financial slavery binds the country banks in its chains is tacitly admitted by this representative banker who sees and appreciates the desperate disease, whether or not he may agree with "theorists" who are striving to strike the chains not only from agriculture, but from all industry and commerce.

Reform of the fiscal system is not hostile to legitimate banking; it only aims to end the money monopoly that compels the country banker to obey the will of the central management, even to the extent of ruining his real friends.

If country bankers fear to trust the government with the issue of currency direct, why should they consent to its issue to the Money Trust?

Give every government bond the circulation privilege, permit every purchasing bank the right of issue to the amount of the bonds deposited, and have no intervening power, and there will be no monopoly.

Government bonds which carry this privilege and bear an interest rate of but two per cent, reduced to one and one-half by the tax on circulation, are at a premium on the market, and there is little question but that non-interest-bearing securities could as well form the basis of a bank-issued currency.

In 1930 the two-per-cents forming the National Bank currency basis will mature, and the plan is then to extend the power of the so-called Federal Reserve. Where then will be the small bank, the country banker?

Work Well Begun

BOTH Houses of Congress have adopted the conference report extending and strengthening the Dillingham three per cent immigration law. This is a fair continuance of a good beginning. The good beginning was accomplished a year ago when public indignation over the invasion of the hordes of undesirable immigrants from Europe compelled the enactment of restrictive legislation.

The fair continuance consists in extending the restrictive legislation for two years, and amending the dangerous clause permitting the entrance of aliens who have resided in contiguous western hemisphere countries, so that the period of residence in those countries prior to admission to the United States shall be five years instead of one year. The imposition of a penalty upon steamship companies guilty of contributing to excessive immigration is also good.

But the problem is by no means solved, although the evils are somewhat minimized. There must be a courageous recognition of the necessity of complete exclusion of non-assimilable elements. The greatest danger lies in the increase in the public apathy which succeeded the initial success of the movement for restrictive legislation. One victory does not win the war, and constant vigilance and greater safeguards are necessary.

Are Church Papers Read?

IN A discussion of the results of a multiplicity of religious publications, the California *Christian Advocate* questions the benefit to the church of so many as are at present struggling for existence. The same multiplicity exists in the secular field, and for the same reason, but the elimination of superfluous literature is not so simple as it is with the religious bodies.

One great trouble is that so many inferior and useless offerings are put on both markets. Individuals aspire to teach the world who themselves lack the equipment either to instruct or to interest.

The editor of a church paper should be of the brightest mentality, thoroughly educated, with an ability to compel attention, and with a knowledge of the world few of the students of theology possess. Not only should he be fitted for his work, but he must be fitted to it. The aptitude, the natural talent, is not to be gained, but thorough education gives ability so to clothe his ideas as to present them as polished jewels to an eager clientele. That clientele must be won by merit.

No paper has the right to claim support merely on the ground of loyalty on the part of sect or party or class it claims to represent. It may achieve a financial support that will keep it alive, but the man who takes it from a sense of duty has no use for it usually, and its printed content is not known to him. He subscribes just as he would give to a beggar—to get rid of the suppliant in the easiest way.

The pastor who suggests from the pulpit the need of the general support of the church paper should be more careful than he is in general to avoid aid to the unworthy. No pastor should accept a commission as an agent for private enterprise. He is paid to do a certain work for his church. If he knows or believes a publication to be of value, there can be no criticism if he says so, publicly or privately, but there his efforts should cease.

Two propositions made by the *Advocate* are not to be questioned: the multiplication of papers does not increase the number of readers, and the expense is a waste and a drain on the sources of supply to those worth while.

The Silence of Science

THE controversy raging around Mr. Bryan and his book against the commonest misconception of Evolution, is one of the strangest occurrences of the post-war period. On the one side is a layman, on the other are the almost unanimous Protestant clergy. The clergy are in a high state of excitement. They preach against and berate Mr. Bryan whom a little while ago they extolled, and they exalt to the skies a scientific theory of 30 years ago which they then characterized as an emanation from hell.

But that is not the strange occurrence alluded to: the strangest part of this whole business is the silence of the scientists. Not a scientist of repute has gotten into the affair, neither to reprove Mr. Bryan nor to approve the clergy. And that is the unkindest cut—nor to approve the clergy. Undoubtedly the clergy expected to be praised for their progressiveness and liberality, but undoubtedly the scientists know that these qualities do not exist today in any greater proportion than they existed 30 years ago; the bulk of the newsmongering clergy are following the fashion now, even as they followed it then—and it is, unfortunately, an out-of-date fashion.

It is not surprising that the scientists do not take part in the Bryan-clergy controversy, but it is somewhat surprising that somewhere a scientist does not arise and set this whole thing straight for the sake of the plain people. It would be a very simple thing to do. It would be just as simple as for an honest financier to admit that there is not enough gold in the world to carry the money that we need to carry our commerce, and that therefore for all practical purposes business is off a cash basis just as money is off a gold basis. Bankers have no idea how they could clear the air by an honest admission or two. Scientists could say, in modern American: "Look here, good people, you are all talking about what you don't understand and what we don't understand. We have every reason to believe in the great principle of Evolution in nature, that things grow from lower to higher, from coarser to finer. But that an ant will ever become an elephant or a toadstool a rhinoceros, or a monkey a man, we have not the slightest ground for believing. Someone once wondered whether man did ascend from monkeys, and following his hint we have come upon any number of wonderful things, but we are much farther from asserting the fact or even the probability than we were 30 years ago. What people who think 'monkey' whenever they hear 'evolution' may mean is not the question; to scientists 'evolution' and 'monkey' have not the popular connotation at all."

It is to be hoped that there are no labor union rules which would prevent authoritative men from liberating the common people from their superstition concerning "evolution." Mr. Bryan is interesting; the clergy are amazing but neither party knows where today's science stands with reference to the question they are raging about. This whole controversy could be stilled, the disputants properly humbled, and the people helped, if science would speak.

Canadian Exchange

NEVER, before, during nor since the World War, was there a moment when there existed a reason for the depreciation of the Canadian dollar in United States money. The exchange rate was an arbitrary demand of the banks, and was participated in on the other side of the border. Under ordinary practice, any exchange would be confined to the cost of service, whether the exchange was made here or over the line. That is, whatever the charge, it would not represent depreciation.

There was no greater inflation of the Canadian paper circulation during the World War, than there was of our own. Her credit was as sound as was that of this country, and only the fact that Canadian currency is not a legal tender here gave opportunity for taxing the holder the difference between face value and what the bankers said they would allow for it.

Recently, Seattle business men decided to accept Canadian currency at par, and boasted of it. Now comes Spokane with a hotel patronized by many Canadians, which has never made a difference between Canadian and American money. There is no question that its fair dealing has made many friends.

The beauty of this generosity is that it has cost the hotel man nothing. He wisely used his American money in carrying on his business, and kept his profits in Canadian currency, from time to time investing them in Canadian war bonds, which, by the way, never went below par.

Now that the rate of exchange between the two countries is again normal, the wisdom of that Spokane landlord is apparent.

Mr. Ford's Page

IT IS sometimes asked, Of what importance is politics to the welfare of the country? This question grows out of a state of mind which is startling when its extent is understood. So long has Government been confused with the Administration which happened to be in office, and so long has the Administration been regarded as the same thing as Politics, that there has come a period of national stock-taking on the part of the people, which has marked Politics at the bottom of the scale.

Political writers of long experience and clear vision are telling us that there is now no choice of parties, that both are rotten. Observers tell us that in the actual work of Government there is not enough difference between one Administration and another to pay for the expense of a national election.

It does seem to be true that, solely because of incompetency, the group composing the Administration—not any Administration in particular, but all administrations of the last 15 or 20 years—has succeeded in doing nothing more astounding than simply putting Washington on a side street. When an Administration is so incompetent that it hinders the Government from leading, the consequence is that for the duration of that Administration, at least, the Government is compelled to step aside while the country marches on.

It may be true that both parties are rotten. But, in saying so, it is necessary to explain what you mean by "parties." Surely you do not mean the people comprising the parties? Surely no one intends to say that the people comprising the Republican and Democratic parties, the citizen voters of the country, are rotten? Hardly. When we use the word "party" nowadays we usually mean the office-holding corporations, the "organization," the fellows who are "rewarded" when their man wins office, the gamblers in the political favors of the people. The "party" is an inside ring which cares for "issues" only as advertising signs with which to bid for the votes of the people. In this sense, both the Republican job-holding corporation and the Democratic job-holding corporation are undoubtedly all that the critics say about them.

That is why both parties evince an equal incompetence when they are elected to office. Arrival at office is their success. It is their objective. Thereafter their main work is consolidating the hold they have gained. They "build their fences" with government favors. They pay no heed to the people until the people show signs of moving on the place. And then the heed they give only means that they defer their game for a little.

The political career of the true party politician is a career of public employment, not of public service. He is trained to achieve public employment; he is not trained to render public service.

How then can these men minister to a country which is passing through a period of world dissolution, men who seek political place for employment's sake, men who seek political power for the personal satisfaction of building up a mere partisan organization?

The consequence has been that events have simply forced politics to a side place. The apathy of the people with regard to elections is explained by their feeling that politics no longer counts. People say that it doesn't matter which side is elected. Often the only satisfaction which they take in voting is that they are voting one set of incompetents out, even though they are conscious that they are only voting another set in.

Business has marched on independently, only asking that politics keep out of the way. Education, invention, development, all have marched on their way, in spite of the indifference of political personages. Business has practically shoved politics to one side. And politics, jealous of its place, has endeavored again and again to throw the halter around the neck of business and compel it to eat out of the politician's hand. It is said that toward the end, Senator Penrose's whole philosophy was that Business in this country should be permitted to do anything it liked, as long as it asked permission of Politics.

Now, this is the situation which has arisen in the country. This is the situation which gives rise to the question, What is the use of Politics? It is just a modern expression of the same spirit which was roused by a tree which refused to bear fruit—"why cumbereth it the ground?" If Politics is good for nothing, if it makes nothing move, if it does not build highways for the country's progress, if it does not appreciably lighten the people's burdens, if it does not make life secure and livelihood an economic certainty, of what use is it?

The impulsive reaction, of course, is to answer that Politics is good for nothing. At present, it is true that Politics is good for nothing. But, the present is a passing phase—the Present is always more than halfway into the Past. When a condition has become fully developed, it is already on its way out. Everything changes; and when it seems that the very height of incompetence or corruption or wicked power has been reached in a situation, that is the time to look up—for with ripeness unto rottenness, with success, the game is up.

Now that is the position of Politics today. It is helpless; it is paying the price of its past insincerity and time-serving; it is reaping what it has sown. But do not confuse politics with Government. Government is a select body of men serving the will of the people according to the terms of the Constitution, and in the perpetuity of the Government all of us have not only a voice but a duty.

Let us grant most freely that the parties have both fallen into the ditch, that politics has been forced to the side lines; but let us also understand that one by one we may select the type of men who can carry on the work of Government and build up a national service which will be the party of the people, under whatever name it may be known.

It is all a matter of men, of their moral soundness and mental strength. All of the great issues are now pooled by the parties. The parties practically agree on the principal lines to be taken. Party loyalty in office today consists mainly in preventing the party in power from doing the right and proper thing, in order that its failure to do so may throw it out of office, and thus let the other party come in and do the very thing it prevented being done. The entire game has degenerated into one of "stealing thunder."

Being all a matter of men the country ought now to select, wherever the election occasion arises, men of right hearts and able minds, men who are eager in a high and serviceable spirit to deal with the matters of Government in a way to lift the load off the people.

That is the answer to the question with which this page began. Choose now men who will be waiting and ready to act when present Politics finally collapses and the new movement forward begins. Let the country embark now on a movement of infiltration by which there shall introduce into Congress and public offices sound men, pledged to nothing which the old régime considers sacred, but pledged only to do that which will make life in America what it was meant to be.

There is still a duty in politics for every man and woman, and it would be a double pity if our disgust for what is, prevents us getting ready for the better things that are to be.

THE people's disgust with politics plays into the politicians' hands, unless it is allied with vision. The fact that people do not expect anything from the old crowd in politics is proof enough that the old crowd is done. But the people should simply accept the fact as it relates to Politics, and not confuse Politics with Government. It is now possible for them quietly to select for Congress men of the right type, even if they shall be unable to do much after re-election. Select them, one by one, here and there and everywhere; let them go to Congress and study the ground; leave them alone; and when the time of the new forward movement comes, you will have a Congress of the right sort of men without any hurrah.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The American Massacre of the Royal Chinook

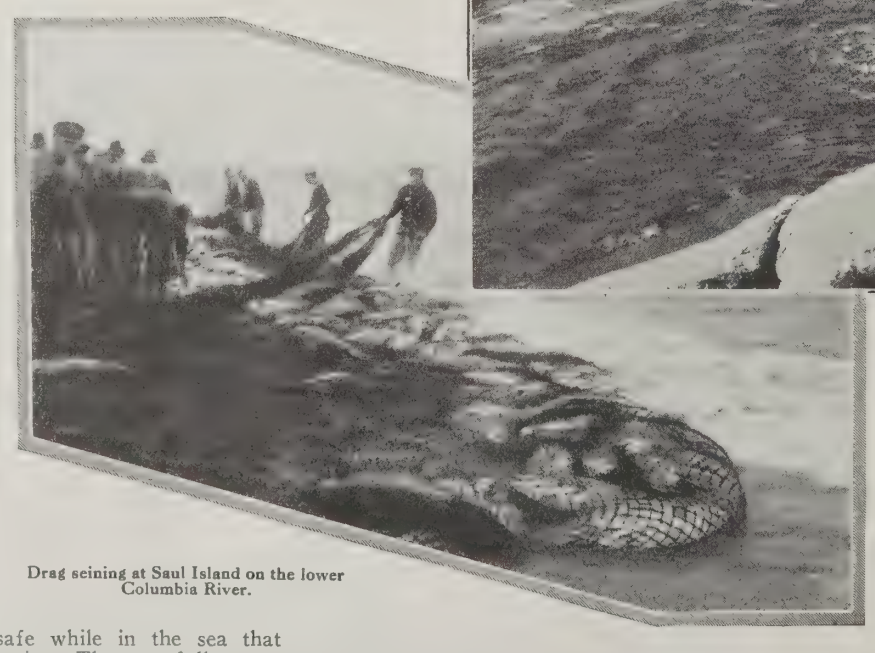
Wherein Man, "the Poor Fish," Stupidly Wastes the Vast Salmon Supply

By B. M. FRANCIS

TO THE most of us the word "salmon" means a reddish-pink meat packed in tins. To some the word brings memories of glorious sport with rod and reel. We see cool forest ways—white water tumbling over rocks—the pool below—the fight—the capture—and we are thrilled again. But the story of the salmon possesses interest and significance beyond the range of any merely superficial knowledge of it. It is interesting because of what the salmon is and what it does—significant because the salmon is threatened with extinction. And so, whether considered as a means of enjoyment in sport or as an article of food and commerce the salmon is worthy of attention.

When Lewis and Clarke, half-famished, reached the Columbia River back in 1804 they found salmon in abundance and a thriving trade in pemmican already established. From a time having its beginning in the traditions of the Indians the Columbia—River of the West—had been the favorite fresh-water home of salmon. A mountain stream, fed by mountain streams, the Columbia with its tributaries appears to be peculiarly adapted to salmon propagation. And it has for years been the chief single source of salmon supply. It is but natural then that the scenes of this story, dealing with some vital phases of the salmon industry, should be laid along the Columbia River. And the chinook is chief both in numbers and in size among the varieties of salmon which frequent the Columbia.

The Columbia River, home of the salmon, looking west from Crown Point.



Salmon fishing at Celilo Falls, Columbia Gorge.

Chinook salmon are hatched in the upper reaches of the tributaries of the Columbia. The fry—numbered by millions—find themselves in a cruel world. They are frequently destroyed by freshets. Every mouth, fin, tooth and claw is against them. When they make their way downstream to the sea they number but one-sixth of one per cent of the original hatch.

Little is known of the salmon during the period they spend in salt water. The better opinion appears to be that about three years is spent on the feeding grounds in the bays, straits and sounds near the coast line. They reach maturity about the fourth year and begin their migration back to the streams in which they were born. If they were comparatively safe while in the sea that condition no longer obtains. They are full grown now—weighing up to 80 pounds—and fair prey of the commercial fisherman. Gill nets, seines, traps, wheels—these and other devices are interposed between them and their destination. Millions are taken and the wonder is that so many escape, but escape they do, to fight their way up the rivulets at the headwaters of the Columbia, with more than half their bodies exposed above the water. Reaching some impassable barrier they remain quiet for several weeks. Pacific salmon, unlike the Atlantic variety, die after spawning. Upon their return to fresh water their appetites decrease—their throats and stomachs contract—and they lose the desire and ability to feed. The accumulated reserve of flesh and oils carries them through until they die upon the spawning grounds, giving up their lives to perpetuate their kind.

We have seen that but one-sixth of one per cent of the fry reach the age at which the young salmon leave the fresh water for the sea. That statement accurately measures the menace to the salmon from its water enemies. But one authority has said, "man is the greatest present menace to the perpetuation of the great salmon fisheries of the Pacific Coast. While in the aggregate the ravages of other fish, animals and birds are considerable, they are hardly a drop in the bucket compared with the ravages of man and his agencies."

Drag seining at Saul Island on the lower Columbia River.

In salmon fishing, as in other things, our boasted national efficiency and business wisdom cut a sorry figure. Here, as in the handling of our timber resources, we have been guilty of shortsightedness and profligate waste.

Prior to 1798 the salmon swarmed in the rivers of New England as they now do in our western streams. In 1798 a dam 16 feet high was thrown across the Connecticut River 100 miles from its mouth. For two or three years the salmon continued to come and vainly tried to reach the spawning grounds. Then the runs ceased. In 1898 a solitary salmon appeared and the local fishermen did not know what it was.

When the alarm first went out that the Pacific salmon was threatened with extinction, an expensive hatchery was erected at Baird, California, where artificial propagation was successfully carried on. Recently a dam without a fishway was built across the Sacramento River below the hatchery. Few fish reached the hatchery last season, and unless a state government removes this menace the propagation plant will be made useless and, worse still, the salmon will disappear from the Sacramento.

The most flagrant abuse of the salmon industry is that committed by the fishermen using purse seines and trolling gear off the mouth of the Columbia and other streams. These men operate on the feeding grounds where the young salmon live between the time when they come down from the fresh water and that when they return to fresh water to spawn and die. The fish they catch are small and of poor quality. Forty per cent of them weigh less than three pounds while the mature chinooks taken in the Columbia River average 22 pounds. Fifteen hundred boats in this service in 1920 off the mouth of the Columbia destroyed more than 5,000,000 pounds of salmon. The effect of this waste upon the industry may be gathered from a recent announcement that the pack of chinook salmon in the Columbia in 1921 was less than 25 per cent of normal.

Up in the Puget Sound country, the Fraser River pack of sockeye salmon has fallen from 1,673,000 cases in 1913 to 76,000 cases in 1921—all because of the trollers and purse seiners who did for the Fraser River what these men have been doing for the Columbia. With five years as the life limit of the salmon it is only necessary to kill the young salmon during a five-year period to wipe out the species. Verily, in comparison with these wastrels, the men who killed

(*Concluded on page 14*)

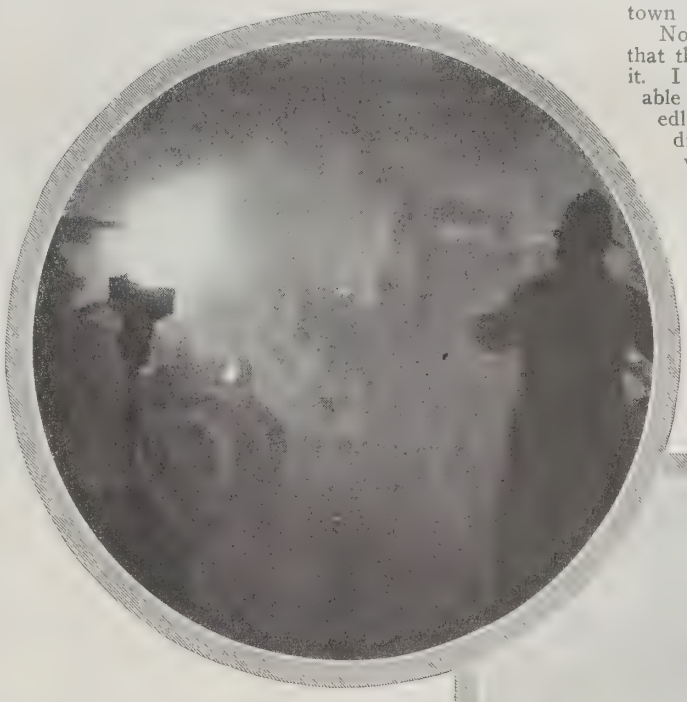
"The London Particular" the Fog of Fogs

Blighty's Pride and Joy, It Gives an Alibi for the Bright Red Nose; Eyes of All Suffer When Darkness Shuts Down on the London Area

By ROBERT J. THOMPSON

I HAVE wondered often enough whether it is this marvelous climate of London, which produces the red noses, watery eyes, and chilblains, of the notably lovely and beautiful women of England, or whether it is the corner saloon, or pub as they call it. It is certain that there are as many women in these places as men, just plain ordinary mothers and respectable wives and working women. One knows there are mothers there, sure enough, as often the children are seen waiting outside. The law does not permit children in the saloons, but now and then you will see some indulgent mother giving them a nip of beer, or "white satin" (Cockney for gin) on the sidewalk.

To be sure, there are red-nosed and red-knuckled girls and women who have never seen the inside of a pub, and they would justly resent the suggestion even that they had their "light" from such a source. So, I presume, it is the climate, with certain phases of its astonishing phenomena, which produces the rosy cheeks of youth and congestion on a bit in years. Paramount among these phenomena is the amazing spectacle known to the people of "Blighty" as "the London Particular." This London Particular, so-called, is peculiar to London climate, and appears now and then, say once in 10 or 20 years, to remind the Londoner, that despite all the equable temperature from our American Gulf Stream, he is still living on the fifty-fourth parallel of latitude, and by all rules of the isothermic game (barring the aforesaid Gulf Stream) he be shivering like the Eskimo on Hudson's Bay. He is in that zone. We of New York, Detroit and Chicago, by a peculiar twist of this same isothermic temperature wave, while latitudinally on a line with Naples or Southern Italy, are climatically alongside of London, minus the fogs, plus the Italian sunshine.



The London Particular is the black fog, an uncanny phenomenon, the combination of a formidable extreme of nature, with an equally frightful extreme of civilization—the Arctic mists, and the smoke of millions of man-made fires. We had one of these visitations the other day, which was said to have been the worst in 25 years. Everybody who has undertaken to say anything about London has, in one way or another, spoken about the fog. It is a classic subject. My experience reminded of boyhood adventures where some over-courageous youngster would dive into a backwater muddy pond and grope around in the murky mass trying to touch bottom, or to locate some familiar, though submerged stump. Regardless of the fact that you cannot see, you move around with your eyes open. As the fog is composed of opaque floating moisture, charged with the gas fumes of every conceivable kind of fuel from millions of grates, stoves, furnaces and retorts—it will be understood that a tightly closed room with a lively fire and a stuffed chimney would be a pleasant place to stop, in comparison.

It is a notable fact that the London regiments on the Flanders Front withstood the gassing attacks of the Germans far better than any of their allied comrades. And why? Experiences with the fogs of London, the home-fires, and conventional visage of Blighty. How they love it! Why, the coughing of the Londoners, for days after one of the appearances, would make you think you are in a Wednesday evening testimonial meeting; and when the fog is actually on, these spontaneous efforts to escape suffocation suggest nothing more truly than machine-gun practice in the mountain valleys of Switzerland. The echoes come back to your battered tympanums a thousand times.

Suppose you fill a bathtub in an icy room with boiling water. In a few moments the room will be so filled with white steam that you cannot see your hand before you. (I know that refrigerated bathrooms are unknown at home, but they are the rule over here.) Now this white steam would have something natural and familiar about it, but fill your bathroom with the smoke and gas of a Chicago River tug as she passes under the boulevard bridge and see what you get, a miniature London Particular.

You can't just bite this fog, but make no mistake, it can bite you. The first attack is on the eyes. The whole London area has the feel and smell of a diphtheritic disinfection of formaldehyde. This vast expanse of human life and industry is blanketed effectively. And underneath this blanket is the effluvium of the traditional home-fires. The exhaust from the engines of more than 3,000 motor buses, and as many more automobiles; pronounced scents and olfactory signals from the tanneries and soap-making quarters of the East End. Billingsgate, the great fishmarket, adds its quota, and finally over and permeating all, are the fumes of some millions of pipes, filled with the tobacco with the kick, which only the Englishman can make. Nearly every man in England smokes a pipe.

But even a confirmed pipe smoker sometimes wants to avoid tobacco smoke, certainly if he has a touch of bronchitis or an inflamed eye. If he rides on the tube he can't do it. Every car is a smoker in the morning and in the evening when the men are going to their places of business or to work. From archbishop to janitor, and from prime minister to his farm laborers in Wales, male Britishers smoke pipes.

Above—Charing Cross, Trafalgar Square, at midday during a "London Particular."

To the right—One of the lions on the Nelson monument in an ordinary London fog.

Above—Trafalgar Square, geographical center of the metropolis, on a clear day. To the left—Houses of Parliament at night, from the Thames.

But to get back to the fog. When this business is on in earnest, all, or practically all, over-ground traffic ceases. It ceases in the sense that a man will stop drinking coffee if he has burned his mouth badly with the first swallow. He still toys with the thing, with more or less profanity and laughter and a blind hesitating effort to carry on. He must muddle through some way. There may be several thousand buses creeping along the London streets, with the conductor in front holding a lantern, a flare, or a white rag. This is done as much in the hope of leading the car out of the fog as it is to proceed along the regular route. The fog moves around like a flood, rolls into open doors, through cracks in walls of buildings, under doors, into windows and fills every crevice and place that water could reach, and more, for it extends upward for a thousand feet or more. A London Particular will turn every exposed piece of silver in London, such as plate, as green as malachite. Thousands of servants are engaged for days afterward polishing silver. Men walk into the river and are drowned. The most brilliantly lighted West End saloon is like a steam room in a Turkish bath.

The London Particular furnishes much the same thrill to the troglodyte dweller of this great metropolis as Mainstreeters used to enjoy in watching the ice go out in the spring, or in helping the town fire departments save the schoolhouse. Wives say to their husbands: "Better not go to the city today in this fog!" And husbands call up from their offices and say to their wives: "Sorry, but this fog—I'll have to put up in town tonight!"

Now the strange thing about the London fog is that the Londoner likes it, and takes a certain pride in it. I can understand the former, but have not been able to figure out the latter. A good fog is undoubtedly an unanswerable excuse for a man to be late to dinner. No grandmother's funeral nor sister's wedding need be brought forward as an excuse for the office boy or clerk to miss a day at the office. The city man can remain in town overnight without raising the sick friend or rush-of-business alibi. He can cancel all engagements, which is pleasing enough to the Londoner, as he is a fiend for holidays.

And they tell you here that the air is purified by the fog and that London is the healthiest big city in the world. Some way I cannot help but associate this point of view of my London friends with the claim made by *Punch,* that it has more than five million readers. They certainly have a very subtle sense of humor —these Londoners—.

And, as to chilblains! Really, I have not known them since I was a youngster in Iowa, when the anthracite base-burner was the last word in house heating. Arrangements for heating have not yet arrived even that far, generally speaking, in England, with the result that chilblains is the universal, all-prevailing national complaint. You might make this assertion here in London and be laughed at for your assumption; but chilblain cures are as prominently displayed in the chemists' shops of London as the knockout ague drops and sarsaparilla cures were shown in the drug stores of fever-stricken Arkansas 30 years ago.

Those English ladies who have not already succumbed to the ever-threatening red nose, and inflamed knuckles, affect the bottle of iodine and paint regularly their fingers and toes. This chilblain malady is, of course, due to continuously chilled extremities, refrigerated (just short of freezing) hands and feet—and nose. I suppose that there are not more than a dozen hotels in this tremendous metropolis that are properly heated. One certainly appreciates, if he be an American, Dante's final degree in the nether regions, where fire and burning lakes of brimstone give way to ice. It has been my observation that, if you want to get entirely away from the ever-present consciousness of chill, in London, in the wintertime, you must take refuge in the lower levels of the Piccadilly tube, or flee to a Turkish bath. It is a fact that you cannot heat the body all the way through from one side only. It simply won't work. The hotter the fire in your grate, the more noticeable the chill on the off side. On the whole it is warmer on the outside of the houses and apartments than it is inside. One always wonders and objects to the open windows affected by the English. He finally learns, however, that this is one way of heating the interior of their houses.

What Your Town Pays for Those Conventions

The Boosters' Band, the Booklets, the Souvenirs, All Have to Be Paid For

By RICHARD C. MOULTON

IT WAS the last day of a national convention of manufacturers which was being held in an eastern city. The time had come to decide on a meeting place for the following year; four cities were in the race. Impassioned speeches were made by representatives of the rival communities, delegations paraded the convention hall, waving banners, pounding bass drums, and wearing grotesque uniforms which were covered with convention badges. The chairman hammered for order, but no one paid attention.

At last, from the bedlam, a man dashed toward the platform waving a sheet of yellow paper above his head. "I have here," he shouted, "a telegram in which the chamber of commerce of my home city guarantees to raise the sum of $40,000 to entertain this convention next year."

Money talked. Mere nebulous hospitality had no chance against the power of gold. A vote was taken and it was decided to hold the next convention in the city that had offered the big money.

This particular convention usually brings about 2,000 delegates and visitors. The city that was willing to put up $40,000, therefore, paid about $20 apiece for the privilege of entertaining its guests.

Experts have figured out that the average man in a strange city spends $10 a day. Of this, $3 is for his room, $3 more for food, and the $4 remaining evaporates as he walks around. It is further estimated that there is a net profit of $2 to the local business man from this $10.

$20 Offered for $2 Profit

FROM actual statistics covering conventions of every sort and extending over many years it has been found that convention visitors average two days in the convention city. Thus at $2 a day profit the man, the community makes $4 on each guest.

Why should any town be willing to offer $20 when only $4 profit is obtained from each visitor?

As a matter of fact, the price of conventions has advanced to the point of little profit for any one. Recently, a gathering of commercial secretaries was held in a southern city. There were only about 50 in attendance, but they were active men representing big interests, and it was decided to treat them right. During the three days of the convention they were tendered two elaborate banquets, taken to the theater, given an automobile ride and otherwise entertained, the cost totaling $30 a man.

The commercial secretaries enjoyed themselves, but felt that the spending of so much money was poor business judgment, and a movement was started to reduce the high cost of conventions. But it is usually easier to start something than to stop it. One secretary, who represented a middle-western city which entertains more than 200 conventions a year, expressed himself in a heart-to-heart talk with his fellow workers.

"My city is spending altogether too much money for the possible good that conventions can do us," said this man; "but as long as we are a convention city I don't see any way out of it. Let us suppose, for instance, that the National Order of Prometheans holds its convention in Atlantic City this summer. There is a strong lodge of the order in our city, and it has been decided to send a powerful delegation to Atlantic City to urge upon the convention to meet with us next year.

"A committee is appointed from the local lodge to call on me and see what the chamber of commerce is willing to do. The committee is naturally enthusiastic; it feels that this is the one chance to put our city on the map. It estimates that the attendance should be fully 10,000; one of the national officers is a local man and people want to see our city.

"There is no use arguing against such optimism, and so I tell them that the convention fund is low, and possibly they are figuring too high on attendance, but I guess we can afford to slip them $500 to help land the convention, and if they get it we can let them have a thousand more. Such small money does not satisfy them. They are perfectly sincere in believing that their convention would be more valuable to the city than locating a truck factory or building a new interurban railroad.

The 10,000 in Reality Are 3,000

"SO THEY slip something over on me. There is a hotel manager on my board of directors, or someone who owns stock in a hotel corporation, and to him the committee adjourns. Again they tell of the importance of their order, and what a wonderful thing it will be to the city to entertain its convention. They explain that the convention headquarters will have to be in some hotel, and it may just as well be the hotel in which their listener is interested.

"The hotel magnate gets enthusiastic over the double prospect of benefiting our city and at the same time filling up his house with four guests in every room. He talks to the other chamber of commerce directors, with the result that the Promethean delegation goes to Atlantic City with $2,000 in its pockets to spend in landing the convention, and the promise of $5,000 more for entertainment if their efforts are successful.

"They come back triumphant. But when their committee sits down to figure it out it is decided that at least $15,000 will be needed to handle the convention creditably. They come back on the chamber of commerce for it, but we have gone the limit. The only thing we can do is to give them a letter of indorsement and turn them loose on the public.

"Then the real struggle begins. Armed with the letter of indorsement, committees go after the money. First, the hotels are visited and shaken down for varying amounts, based on the number of their rooms. The restaurants come next; then the merchants generally. It is no use for a man, seeing a committee heading his way, to slip out the back door, because he will be visited until found and made to declare flat-footed whether he stands for progress and a subscription or is willing to be classed among the slackers and mossbacks. Eventually the money is raised.

"The time for the convention arrives. A full brass band is stationed at the union depot, playing lively music as each train rolls in. Members of the reception committee wearing cordially worded badges greet the delegates as they arrive, and bundle them into waiting automobiles which have been loaned for the occasion by citizens. Taxicab drivers look on disagreeably and remark to each other that no other city in the country would pull off a cheap stunt like that.

"The town is all dressed up for the occasion. A little welcoming pennant hangs from every trolley cross wire, and all the store windows in the downtown district display elaborate signs lettered in sentiments of hearty greeting. The lobby of the headquarters hotel is a crowded mass of delegates from every part of the country, each man wearing a hatband lettered with the name of his home town, and a badge on his breast inscribed with his own name so that he may be welcomed without the formality of an introduction.

"The mayor makes a speech at the opening session of the convention. He tells them all about our natural advantages, how many railroads we have, how much our annual bank clearings are, and that a welcoming hand is always extended to strangers who are thinking of establishing industries in our city.

"Instead of 10,000 delegates being in attendance, about 3,000 actually appear which is as many as the experienced expected. These 3,000 are given a banquet, a barbecue, an automobile ride to all points of interest, and a book of coupons good for free rides on the street cars. The $15,000 disappears like chaff before the wind.

Advertise Their Home Towns

"BUT instead of being impressed by the hospitality and talking about coming to locate factories among us the delegates persist in advertising their own home towns. Groups of them can be seen at any time congregating in hotel lobbies to let out fierce yells or sing songs in praise of Dallas, Spokane or Atlanta. There are booths everywhere with workers in attendance to give out information, souvenirs and literature of Buffalo, Birmingham, Duluth or San Diego. El Paso delegates mounted on burros stage a solemn parade through the convention hotel lobby. A citizen of Norfolk stands on a table to tell everyone that his city has the finest harbor in the world and that his hearers had better hurry up and move to Norfolk if they want to get in line with progress. New Orleans rents a hall and maintains a free motion picture show to visualize the attractions of Canal street and the old French Quarter. San Antonio gives away more than $600 worth of paper weights made in reproduction of the Alamo.

"The delegates are kept so busy that they don't get round to spend much money with the merchants. Two or three of the downtown hotels are crowded, but the others have rooms to spare. The managers regret that they had been so optimistic as to put cards in all their rooms a week before, asking traveling men to vacate in time for the convention. No real estate dealer reports the sale of a factory site to a stranger. The convention is an artistic success but a financial failure."

The same rules apply to smaller gatherings as to the big national affairs. Many towns that cannot afford to go after big league events make a specialty of state conventions. A state convention of druggists, for instance, is to be held. Two or three drug men in some small city make up their minds that it would be a good thing to entertain their fellow craftsmen. They are members of the local chamber of commerce and naturally go to that body for assistance. Because of their membership it is difficult to refuse them, and so the chamber backs them up to the extent of a few hundred dollars.

It is believed that a thousand druggists and their wives will attend, but at the last minute many find it impossible to leave home, and so only a handful, perhaps 200 in all, appear. The hotels and restaurants do some business, but practically no other lines are benefited. The visitors are shown a pleasant time, but no one decides to come to the city to live, because all his interests are bound up in his home town. They do not patronize the merchants much, because everyone feels a loyalty to his brother storekeepers back home.

The annual convention of the Texas Cattle Raisers' Association is considered one of the most desirable affairs held in the Southwest. Every year the larger cities of Texas and Oklahoma compete for the privilege of entertaining the cattle raisers. It has been no unusual thing for a city to spend $25,000 in getting it.

Formerly, this convention brought real money to town. Many cattlemen would bring their families and buy merchandise to last the year. Merchants stocked up with the most expensive goods against the coming of the cattlemen and their families. Diamond dealers from other cities rented rooms to display platinum and diamond jewelry.

But of late years business at the cattlemen's convention has not been so good. The cattlemen were more prosperous than ever, but the convention city's bank clearings invariably showed a smaller increase during the week than had been the case in former years. A certain chamber of commerce secretary made an exhaustive investigation to learn the cause of the decline, and his report should interest business men everywhere, because conditions are approximately the same in all sections of the country.

"Cattlemen and other country dwellers are spending more money than they ever did," this secretary reported to his board of directors, "but they are not spending it so freely at their conventions nor in the large cities generally. The small towns are getting a greater share of it than in former years.

"This condition, as I understand it, is due largely to good roads and automobiles. Years ago the family that lived 10 miles from town was distinctly out in the country. It was somewhat of an event to go to town. The team that made the trip was taken off farm work the day before to rest up for the journey, and an early start was made to get back by chore time. The excursion took four hours of driving.

"Under these conditions the family did not go to town often, and so did not get in the habit of buying from their small-town merchants. It was almost as easy and much more attractive to wait until they went to the big city to do their buying all at once.

The Giving Away of Booklets

"BUT when the family got an automobile the 10-mile trip to their village and back was nothing. When any small thing was needed someone would jump into the machine and be home again in an hour and a half. After the chores were done in the evening everyone would get into the car and go to town for a picture show.

"And the fact that the countryman saw his small-town merchant oftener made it more natural to do business with him. When the wife wanted a tailor-made suit or the daughter a wrist watch they gave a local storekeeper a chance to make the sale instead of passing him by in favor of the big-city establishment. The increased business in turn made it possible for the small-town dealer to carry more up-to-date merchandise. He stocked nationally advertised goods. His store changed; he put in a plate-glass front with marble trimmings, and varied his window displays twice a week. He is not a country storekeeper any more, but a merchant.

"No one who has traveled among the small towns can fail to appreciate the change that has come over the retail stores in those places. Small-town and country people are patronizing their local business men. And this, as I understand it, is the reason the cattlemen's convention is not so desirable as formerly. It is still a most desirable affair, but certainly not worth spending so much money to get as has been the custom."

One convention extravagance that will stand correcting is the promiscuous giving away of booklets. No matter how small the city, it has its boosting booklet, printed on fine enameled paper and the half-tone illustrations all framed artistically with handmade drawings. The sky line of Main street is shown at two different angles from the First National Bank corner. The new courthouse, decisively stated to be the finest in that part of the state, is shown, as well as the M. R. & S. passenger depot. The leading hotel occupies a full page, not exactly an advertisement, but unable to restrain giving the information that it is newly furnished throughout and that its rates are $1.50 upward, European plan. Several private residences are illustrated, to give casual readers an idea of the type of homes prevailing in the city.

"Newcomers" in Towns Blamed

IT IS no one's business to know just how much it cost the owners of the private residences to get into the book, nor what the leading hotel contributed; but someone had to pay the bills, and it costs about 25 cents apiece to manufacture such booklets. Did you ever attend a convention and see what becomes of such publications? They are thrust into the hands of the delegate from every angle. They are in his room when the bell boy first shows him up and asks self-consciously if there isn't anything more that he wishes; the check girl hands them out to him with his hat when he comes out of the dining room; in the convention hall they are on every seat, and piles of them are at the door for free distribution. From the booths round the hotel lobby booklets are pressed on the delegate with such insistence that he just can't help filling his side pockets several times a day.

At a small convention recently attended by the writer, where there were fewer than 200 delegates, one ambitious community sent a thousand elaborate booklets for distribution—at least two hundred and fifty dollars' worth. It is estimated that about one out of 20 booklets thus distributed is actually carried home. The rest are disposed of as decently as possible after the delegate is out of sight of the giver. On the basis of one in 20, therefore, it costs $5 to get a man to read a booklet and carry it home.

The convention manager of a Pacific Coast city blames the newcomers for the high costs. "The prices

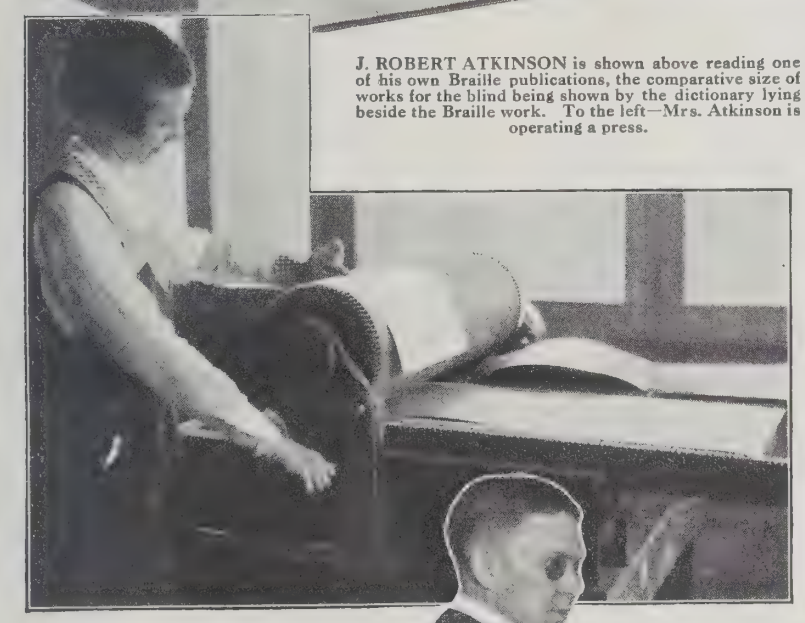
Blind Man Leads Blind Through Braille Bible



California Publisher Helps Vision of Those Who See With Their Fingers

By HENRIETTE BOECKMANN

BECAUSE he himself is blind, J. Robert Atkinson resolved to do all in his power to lessen the darkness of his sightless comrades. This he is now accomplishing as a publisher for the blind in a chalet-type house situated in a pretty part of Los Angeles' residential section. This establishment, known as the Universal Braille Press, has already supplied many of this country's 75,000 blind people with literature that serves to free them from constant contemplation of their affliction. Recently, this blind publisher for the blind was elected a trustee of the American Foundation for the Blind with headquarters in Washington, D. C., a newly incorporated organization whose primary object is to aid all activities for the blind.

At present Mr. Atkinson is chiefly concerned with the publication of the Bible in the newly adopted Revised Braille, Grade One and a Half, which has been found to be the easiest reading form of embossed lettering for those who must use the ball of the finger for sight. The size of this undertaking is not readily comprehended by those not familiar with the books of the blind, but until the task is accomplished the blind of our schools for the sightless, including our war-blinded soldiers, will have no direct access to the Bible because there are no Bibles embossed in the Revised Braille which is now taught in all of these institutions.

J. ROBERT ATKINSON is shown above reading one of his own Braille publications, the comparative size of works for the blind being shown by the dictionary lying beside the Braille work. To the left—Mrs. Atkinson is operating a press.

This Bible for the blind will contain 20 volumes, the first of which has been embossed. This first volume contains only "The Acts," "Romans" and the two epistles of the "Corinthians," and yet its size is greater than that of Webster's New International Dictionary! With 135 pages, each thirteen and a half inches square, it weighs five and a half pounds and is three inches thick.

There will be 2,600 pages in the completed Bible with 4 volumes in the New Testament and 16 in the Old Testament, each volume varying from 80 to 150 pages in length and all being thirteen and a half inches square. While the cost will be about $50 for the 20 volumes, it will be given away free or loaned to those who cannot pay all or a portion of the cost price. With the financial aid of interested benefactors, it is the hope of the publisher that the Bible will be completed before the end of the year. The Bible which is now available in the old embossed types, is likely soon to be relegated to the shelf, as the old system of sightless reading is replaced by the new.

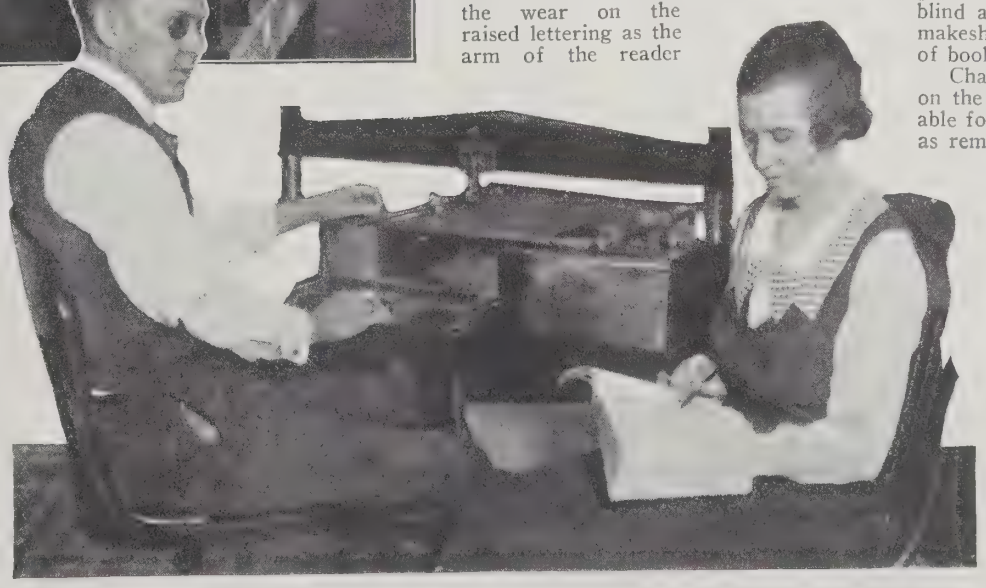
At no time will a price be placed on the Bible above the actual cost of the printing and binding, the brass plates having been provided for by a fund contributed for that purpose.

"There are today," said Mr. Atkinson, "only a few institutions in this country engaged in printing for the blind, and these have been compelled, in almost every instance, to establish their own precedents. Their limited financial ability has compelled them to install the crudest of machinery. This is the principal reason why embossed books for the blind have been in some instances in the past so crudely prepared that the average man or woman encouraged to learn tactile reading has been discouraged at the outset. Through several years of experience as a reader of embossed books for the blind in the various types, and through observation, I became aware of these conditions."

The chapter and verse on each Brailled Bible page are placed at the bottom, allowing a reference to be found by merely opening the volume. This means an elimination of much of the wear on the raised lettering as the arm of the reader moves across it. Another convenience conceived by the blind embosser is the placing of the verse numbers in the right-hand margin at the end of the Braille lines wherein the verses begin. This, in comparison to the old method, will amount to a conservation of 125 pages in the completed series of Braille Bible volumes.

The stereotype plate-making machine is the invention of the blind manager of the Universal Braille Press who manipulates the six keys to form the raised letters on the brass plates, the initial step in Braille printing processes. Due to the fact that the plate-making machine on the market was unsuited to the needs of a blind embosser, Mr. Atkinson applied his inventiveness to evolving a machine.

"When asked to publish the Bible in Revised Braille," said the blind publisher, "I consented, not fully realizing what a tremendous work, under the existing paraphernalia for Braille printing, I was undertaking. I learned among the very first things, that the Braille stereotype plate-making machines manufactured in this country had never given satisfaction, and they were wholly inadequate."



The improved plate-making machine weighs nearly 600 pounds and is designed to accommodate any size of type or plate apt to be used, the plate, during process of embossing, resting in a horizontal position. It is equipped for operation electrically or with foot-power, with a cam motion. The keyboard, composed of six keys as in a Braille typewriter, is six inches lower than the table-like top of the machine upon which the brass plates rest and slide across in the process of embossing, making it about 28 inches from the floor, which is the regulation height for typewriter stands and allows the operator to retain an upright position when at work.

Whereas the ordinary stereotype plate-making machine is furnished with but one-size type, this machine allows for five different type-sizes as well as five different line and letter spacings, the changing from one size to another being controlled by a simple adjustment. All this is important since it allows for the desirable difference in type size as when in publishing a technical work the type might be small since the reader would peruse the work slowly, whereas in a novel in Braille, the type would be larger, allowing quicker headway.

When a mistake is made by a key wrongly struck, thus producing an extra dot, it is easily corrected without removing the plate by means of a little anvil, together with a small punch and hammer attached to the machine, all of which constitute a noteworthy saving in time.

His fingers ably guiding keys and plate alike, the blind publisher sits at this plate-making machine with his wife dictating to him. So he will make plate after plate of the 2,600 required for the completed Bible. The combined weight of the brass plates for the complete Bible will be 1,500 pounds. Across the hall is the hand press used for proofs for the finished plates. Mrs. Atkinson runs this press and also reads proof. The first volume of the Bible as well as much other literature was printed on this hand press, but now through the subscription of funds, a Colts Armory Platen Press, 14 by 22 inches, has been added to the equipment.

There is little incentive to invent standard machinery for the printing of Braille since there is small demand for such gear. State schools for the blind are generally forced to makeshifts in the embossing of books.

Mrs. Atkinson dictating while her husband operates the stereotype plate-making machine he designed to emboss tablets with revised Braille lettering.

Changes have been made on the press to make it suitable for Braille printing, such as removing the ink arrangement and adding a special plate on the bed of the press to accommodate two embossed plates, thereby supplying a capacity for two printed impressions with every operation of the platen.

A primitive method is necessary because of poor housing facilities. The sheets of paper before receiving the embossed lettering must be wet down, six sheets at a time, until many thousands are dampened with the garden-hose out in the back yard. After remaining overnight these must be placed in the press and upon being taken out each newly Brailled sheet is carefully dried. It is planned to turn out 100 volumes at a run as soon as sufficient paper has been obtained. Only a dozen of the first volumes of the Bible have been made to date on the new press. The work must move

The Women Who Introduce the Paris Modes

How "Paris Frock" Is Brought Out in Famous Ateliers of French Capital

By LEONORA RAINES

IN AUGUST, 1914, women the world over were anxious to know if sartorial Paris would rise above the tragedy. With Frenchmen—who play such an important part in the making of modes—called to arms, with America, the best client, cut off by a mined ocean, with native women unable to invest, the prospect was black. Europe takes a long shot at French styles and is never of much consideration. With war separating the countries, it was no great loss, but America—that was another story.

Buyers had arrived for the show of frocks, and to them the *couturiers* sold out en masse. The season was doomed, and the merchant took what he could get for the collection. Parisians, during the four years following, had a hard time fighting against going to the wall, for by 1918 the over-sea commissioner had become almost unknown.

Bickering and fighting among the dressmakers followed an institution of what was called the "Syndicate to Protect French Fashions." A half-dozen houses instigated the alliance, and united to oust foreign houses. Lists were made of the native firms and the *soi-disant* foreign firms—to be handed buyers. The scheme was not practical, for it undertook to dictate to commissioners where to order and where not to order.

The American swallowed a few do's and don't's, then said he'd "be damned if he would," and it was the damn that ended the syndicates. As soon as houses understood that buyers were threatening to return home without spending a sou, they began to suffer with what is known as *"pieds frappés."* The first of February, 1916, saw nearly all members of the company withdrawing. The organization smothered, the *couturiers* pulled together again and it was the renewed union that saved Paris.

Last to Adopt Tailor-made

ALL the big houses remained open and turned off but few hands. Worth, who installed an ambulance in the same Rue de la Paix establishment in 1870, turned his top floor into a hospital in 1915. Had the firms closed even temporarily, their future would have been doubtful, and the masters realized this. In deep water, they just swam along lightly, and though it was a life-and-death stroke, they managed to keep their heads above.

Those difficult times passed, the Paris dressmaker's *métier* has more teeth in it than ever. It grows, for fresh recruits are ever making the list longer. Little firms that spring up overnight with no heed to dull season or fickle clientage, are naturally crushed in due time. What is curious is that firms that were prominent 25 years ago are in the front row today. The chiefs may have passed away, but those who inherited or bought the business had discretion enough to carry on old traditions.

Until 1900, Paris was known for creations of flimsy, filmy robes, and the workers were French. When tailored suits, introduced by the English mantua-maker, Mamby, began to occupy an important place in wardrobes, foreign cutters found the road to the French capital. London had already launched the cut and demonstrated its trimness, then Vienna took up the idea and did big things, making the severe lines more adaptable to the curves of the feminine form. Paris was the last to adopt the tailor-made.

Becoming the hub for dress, English, Austrian, Italian and German hands crowded into Paris, to assist in turning out the wonderful man-cut suit for women. They all felt it had come to stay. There seemed no barring the foreign labor. In sooth, the French were pleased to have it, for their fingers have no patience for ironing flat seams and for machine stitching required for tailored costumes, and since the newcomer assisted in rounding off the market and centralizing the wardrobe, he was a welcome invader.

How the Places Are Fitted Out

IN TIME all the houses combined tailor-mades with fancy creations. Some old firms stood aloof a long while. *Ateliers* had to be equipped and enlarged, more hands engaged if the tailors were annexed. For many years the tailor department has occupied an important floor in establishments. Drecoll came from Vienna in 1900 and tried to make tailored suits and nothing else, but he had to fit out rooms for afternoon and evening things. Lanvin wanted to occupy herself with only silks and mousselines, but soon found that a one-sided establishment had no future, and when she moved into the new place on the rue St. Honoré, converted one floor into a tailoring department.

In the old days the houses used to center about the Rue de la Paix and Place Vendome, where rents have always been enormous and space contracted. The historic houses are picturesquely constructed, much room given to palatial staircases which are an accompaniment to Place Vendome. After the Exposition of 1900, when trade began to spread, heads of new firms found rooms in other parts of the city. Poiret and Bulloz were the first to get near the Etoile. The Rue de Rivoli, looked upon as the street for imitation jewelry, was adopted by Redfern, and later by Vionnet.

When it comes to *décor*, all the houses resemble each other more or less. They are Frenchily furnished, which indicates that chairs, sofas and tables are pretty, but rather gorgeous and tawdry. Callot's is a trifle more serious, perhaps, because completed during the war. Chenal's is young and giddy, and the tiny boudoir is indeed dainty, with walls massed in taffetas. Lucile's rooms are copies of Watteau interiors. Bernard shows Wallan influence, since Bernard himself is Belgian.

Madeleine and Madeleine took over the house occupied by James Gordon Bennett during his sojourn in Paris, and the rooms are youthful and frivolous in their brocade and satin setting. Jenny's is refined to the point of drabness. The walls are in pearl, the rugs stone color, the chandeliers suggest icicles when lighted and the light reflected in the prisms. Go to Poiret's a rainy day, and the dark hangings make you think you're in a cavern, the stalactites and stalagmites meeting and embracing in the gloom. On a sunny afternoon, the colors flush with light, and become as those of Aladdin's lamp—with a mist to check the wholesomeness of the scene.

The houses have spring and autumn openings during the same week. There is not a marked diversity in the number of models or mannequins. To the uninitiated the establishments may appear to resemble each other in personality, but each is unlike its competitor. While there is not open hostility, certainly the heads do not fall on each other's necks when they meet. They are all informed what the other is launching, how many orders the "big fish" leave.

Though women were powers behind the masters almost from the first successes of the Paris houses in designing, originating and carrying on the material part of the business, their names never appeared with that of their husbands or partners. Jeannie Hallé was the first to branch out and give her name to her firm. She was followed by Jeanne Lanvin. Then Gabrielle Chenal joined the women ranks, also Madeleine Vionnet. With Madeleine and Madeleine, the Paris *couturière* is well represented.

Women have had a decided stimulus on the *métier*. They are fussy, they manage to be "everywhere at the same time." Their intuition tells them whom to trust, whom not to trust. They are right behind the hands that lag, they carry in memory the addresses and bills of clients. The *couturières* are none too obliging, especially in their dealings with other women. They are quite independent, and their wares are for you to accept or ignore, just as you wish. The *couturiers* are far more agreeable and accommodating.

Worth, the oldest firm, came into prominence through making court robes for English drawing-rooms. The father of the present head was a Welshman, married to a French dressmaker. Young Mr. Worth took an interest in his wife's business. He had an eye for colors, he adored rich trimmings, and he helped group effects. With his touches, Madame's frocks were charming, and the pair were launched by an Englishwoman who liked the tiny shop and wished to encourage a compatriot.

First Worth Creation a Success

THE first Worth garment was a success, and the Englishwoman recommended her friends who took to ordering their clothes there. Queen Victoria had not long ascended the throne, there were Presentations every week, and the Welshman's hand soon became famous. To this day, Worth's clientele, the greater part, is foreign, just as is the clientele of the other houses. The heads make sufficient at the beginning of each season to regulate actual expenses of the year, and home orders represent the profit.

Jeanne Lanvin, who gained renown for dressing children, was induced to design for grown-up girls. Debutantes like her as well as other houses, for where is the Paris *couturier* who does not draw and sew for youth? The woman over 30 does not exist. Designers wish to make all snippy and curveless, consequently their creations are schoolgirlish and sexless. Cubists they are, banded to suppress nature and exaggerate skinniness.

Very commercial the dressmakers are. They make dividends on material, on agencies, and are not above taking profits on articles in the way of bags, boudoir trimmings, lingerie, peltry, and so on. Entering some places you pass through a sort of store—although the heads would be scandalized to call it such—where headdress, perfumery, hosiery, and so on, are displayed. When visitors get by the lacy things thrown innocently about, they turn to glance about, and a *vendeuse* who just happens along, saunters over and holds up the object for closer inspection. The things are bewildering, and few women get off without buying.

The American commissioner is there before the show opens in August and February. He hovers over Paris a fortnight, and when he leaves, the houses flop and take the first breath they have had for weeks. The importers get behind their commands, and during those tempestuous days, embroiderers, cutters, fitters, trimmers, slave day and night. The frocks are finished regulation size, that worn by the mannequins. If each had to be cut on varied measurements, labor would consume double the time. As the garment has to be copied in America, proportions are worked out on this side. Parisians do not order clothes till the season is well advanced.

Two hundred pieces, tailors, afternoon, evening, *négligé*, were in former times shown, but since the war Callot has added to her number. The buyers are wilted enough after the collection has been passed; in fact, the senses begin to grow dizzy after that first hundred, but the *couturière* thinks it to her interest to dazzle and keep on dazzling. Out of the number, there are far more failures than successes. The first hour stamps the longevity of a garment, and the deadheads are massed together, sometimes made over, or cast aside. The successes, probably 20 in all, are shown the private clientele which comes when things have quieted down.

The houses drip with red tape. The first days of opening, every one is more or less a spy suspect. The masters fear someone may creep in to steal ideas and give them to smaller firms, or, worse still, get the novelties across the Atlantic, for the American designer and dressmaker are their greatest rival and menace. Every man or woman entering to view the parade in the early days must be known and vouched for. Each chair has its name on the list, reserved in advance, and each chair is supposed to bring in returns.

The *vendeuse* makes it convenient to cast her eye over the paper in the hands of the commissioner and fashion correspondent (the latter by special grace allowed to enter the chosen assembly), and stand guard that no pictures or designs fall into the notebook. When the big orders have been taken, surveillance relaxes. The *courtisanes*—what is left of them—soon begin to appear on the scene. They were becoming scarce before the war, and since 1914.

Up to 20 years ago, the women were a power in Paris and lorded it over trade. It was they who started the big dressmakers on their road to fortune, not only by giving orders, but by advertising clothes, for anything on the women who were launched because of their *chic*, shone.

All Dislike Paul Poiret

NATIVE and foreign residents return from the Riviera about a month after the openings, and they keep the *couturier* occupied in a mild way the rest of the season. Some of the young women of the old nobility are clients of the Place Vendome and Rue de la Paix establishments, but while many of the foreign colonies invest in clothes there, comparatively few of the French have means enough to follow and indulge in fashions of the high-mark firms. Paris is full of *nouveau riche* and *nouveau pauvre*, and the former, who does most of her shopping near Place Vendome, is not representative as to manner or decorum.

To a great extent the *couturiers* copy each other, but conservatives balk if one goes beyond the limit for something original. They all have it in for Paul Poiret, though they bow to his master mind. They say he is dragging their calling in the mire, but sooner or later, they adopt his ideas. Poiret's "sick imagination" as they title it, was the forerunner of cubist painting, or at least the public knew of such effects through clothes before painters gave publicity to canvases. When Poiret began to view things from a crooked perspective, artists fell in line, and at Salon Vernissage—where new paintings are exhibited—Poiret is sure to be an interested and sympathetic spectator.

Poiret was the real inventor of camouflage, though his creations represented effects that squared instead of the military ones that rippled. His salons—in mirky gray, sickly green, dusky rose, would give one the grouches if one ran into them haphazardly. The master knows what will happen, so he dopes his guests as they enter. Concealed pagodas of incense are everywhere, and the newcomer drinks in the musky air without being conscious of it. As a result, the colors appear as part of the atmosphere. Pretty soon the mannequins begin to gawk in, and their cadaverousness makes you feel you're looking at Egyptian mummies that have climbed from their cases and snatched on clothes.

Poiret abhors stays. His mannequins must have no indication of flesh, yet in spite of his emaciated "clothes horses," he wishes them to appear as women of the harem in flapper suggestion, the loose, uneven line being his favored. He so admires southern women that he has placed in the mannequins' dressing room boxes of that peculiar saffron powder which produces a jaundice complexion. It is he who introduced the lilac face lotion that gives the consumptive look, also it was Poiret who created green, purple and white wigs for young women.

Evolutions—Not Inventions

NEITHER the fashions of this *couturier* nor those of the others spring up overnight. They are evolutions rather than inventions, and there are numerous ways of preparing them. The *couturier* keeps the eye skinned for novelties. Master and employe are supposed to be busy, but if anything pretty and untried appears, saleswomen note it, and signal the boss. He walks in for a look, and if possible makes it convenient to see the coat or frock at every angle so he may work out proportions. At the next opening, it will be found among the original and exclusive styles launched by the firm.

This was the way with a little Texas gown that arrived in Paris one summer. The maker of it was unknown, the silk and findings all American, and the frock—which all told cost $25—had some new and attractive tricks of drapery and trimming. The head of the house was apparently admiring the silk and dyes, but in reality he was measuring the volants and taking in other details of the garment. Two months later, the dress was duplicated in the new collection, the price, $140.

When they draft models and prepare the assortment, the French have no other wearer than their own in mind, and that is why other Europeans do not accept the fashions not suited to them. Dresses issuing from the French *ateliers*, barring those copied from foreign clothes, are essentially French. The French do not

America's Generosity Is Armenia's Only Hope

First Christian Nation in Danger of Being Blotted Off Globe;

Reduction of Relief Expenditures a Matter of Life and Death

NEAR East Relief includes in its field of operations Constantinople and the adjoining territory in European Turkey, Anatolia, Armenia, Cilicia, Kurdistan, Syria, Palestine, Mesopotamia, Persia and Transcaucasia (Russia), including Russian Armenia and Georgia, and is the only American relief agency now operating extensively in these areas. While relief has been given on the basis of greatest need to all dependent people of the Near East, the greater part of the work has been among the Armenians, Greeks, Syrians and Assyrians.

At least 1,000,000 people, chiefly Armenian and other exiled subject races, are living in the Near East today who would have perished had it not been for American relief.

The largest single unit of relief work done by Near East Relief has been in the portion of Transcaucasia known as Russian Armenia. Certainly 500,000 persons in this area a year ago were dependent upon relief. There is still urgent need for adult relief, but in keeping with the policy to confine work as far as possible to child welfare, and with the limitations of the budget, the committee is withdrawing wherever possible from adult relief. In Constantinople, however, there remain two large refugee camps, filled chiefly with women and children, and one large camp at Rodosto for Greek refugees, where the relief workers are helping with medical supplies.

Near East Relief maintains 38 hospitals and 59 clinics, and conducts or supervises other dispensary and sanitary work. Eighty-eight thousand four hundred one patients were recorded in the last completed monthly report.

No opportunity is lost to develop the largest possible measure of self-support in connection with all relief work. The people naturally are frugal, thrifty and eager for their industrial independence. Given a single year of peace, and the adult population would regain complete self-support. Industries of various types, adapted to the training of the men, women and children, are conducted at most of the relief stations. At Rodosto 5,000 refugees were established in farm lands and a large agricultural development is being organized in the Caucasus. The greatest need for industrial relief is in the Caucasus, but the whole economic life of the country is so disorganized, and tools and raw materials are so lacking, that the task is extremely difficult.

Near East Relief is conducting 124 orphanages, in which there are 64,107 children, and there are approximately 50,000 others, outside the orphanages, who are dependent for the necessities of life. It is impossible to estimate the other thousands of children who should be cared for. At Alexandropol alone, where there are 18,000 in Near East Relief orphanages, there are at least 20,000 additional children who are homeless.

The organization maintains a rigid economy of administration, both at home and overseas. All members of the governing Administration Committee overseas contribute their services without compensation. Compensation for full-time service of orphanage directors, doctors, nurses and other workers, is designed to cover only reasonable living expenses. No large salaries, either in America or overseas, are paid by Near East Relief. The economy of administration is due in large measure to the exceptional amount of volunteer unpaid service contributed, and by the free use of valuable land, buildings and other properties overseas.

AT THE foot of Mt. Ararat, scores of generations ago, Civilization was born. Today, on the tableland of Armenia, where first the rainbow of promise glimpsed eternal hope to all mankind, a Christian race is dying while Civilization looks on.

Sixteen centuries ago when the light of Christianity was flickering faintly in a pagan world, one nation dared the fires of persecution to acknowledge the Christ. Tried with fire and sword by Moslem and pagan to compel the acceptance of their doctrines, the Armenian remained true to the faith he had adopted in the world's darkest era.

Now in Christian Armenia alone the torch and the sword still spread death and destruction unchecked. War's cruelty goes on though the world is at peace.

And, tragic to relate, Armenia has fared worst of all in appeals to Christian America for aid.

The Jews have raised their $17,000,000 to care for Jews; the United States Government has sent $20,000,000 to care for Bolshevik Russians. But the Christians of Armenia are still murdered by the Turks and killed by Famine. Why are the Christian Armenians last to receive the help of the Christian world?

American aid has gone forth to China. Hindus and German children, Belgian babies and deported Jews, French orphans and famine-sufferers of India—these and many more have not appealed in vain to us for succor. Armenia remains.

Last year 140 Armenian villages, peopled by simple men and women, trained to the arts of peace and commerce, were destroyed. Men were herded into buildings and the torch applied. Women by the thousand met death and worse. Multitudes of little children were driven out on the hot sands to perish miserably.

A Country of Orphans

WHILE the despoiler still rides in the land, Armenia has become a country of orphans. Hunger and nakedness rule, and sickness stalks those who still evade those calls to destruction.

One hope only remains for the stricken country—the generous hand of America. Charity still can save the children from starvation. Care still may save the sick. Otherwise a brave nation will be wiped off the page of history in the world's most enlightened age!

So scant has been the response—the Christian response to the Christian appeal—that an order has been issued for the Near East Relief to reduce all life-saving work 25 per cent!

This sadly cruel order with so many human lives at stake caused the *Literary Digest* on April 15 to print a long editorial appeal setting forth the conditions in Armenia, laying stress on the peril, and appealing for aid. Analyzing the demand for a 25-per-cent cut in expenditures, the *Digest* said:

"Twenty-five children from every hundred now receiving care must be turned away. Among the many thousands whose wails of hunger and sickness and cold have not yet been answered, not one can be satisfied."

Succinctly telling the story of the stricken land are cablegrams which the periodical reproduces. Via Paris came this inquiry:

"Thousands of deportees filling Near East threshold, receiving crust of bread, hoping for summer peace. *Shall we push them off our doorstep?* Order of 25 per cent necessitates closing."

From Constantinople this came:

852 in One Hospital

"APPALLING increase of need for general relief throughout Anatolia Caucasus. Reduction in already inadequate appropriations cuts off multitudes who are hopeless without American aid."

And from the American Women's Hospital at Erivan:

> **"We have 852 cases in the hospital, and children dying in all corners of Erivan. All day long we can hear the wails and groans of little children outside the office buildings hoping we can and will pick them up. If the sun shines a little while they quiet down; when it rains they begin again. One day when the rain turned to snow it was awful to listen to them. The note of terror that came into the general wail was plainly perceptible upstairs, and I had the windows closed. They well know what a night in the snow would mean to them. We are picking them up as fast as possible, but it is fatal to crowd them to such a point that we would lose even those already in orphanage."**

Only a step away from the site of the Garden of Eden, Armenia is a land which should flow with milk and honey. But its inhabitants are starving. Children walk through muddy gutters seeking feverishly for orange peels, apple cores, or anything resembling food. The hand of the invader and the pillager has borne too heavily on the country for centuries for the natural fruitfulness of the land to do good.

The gentle pastures of Armenia should be filled with lowing herds of cattle, and its rocky fastnesses should be alive with sheep and goats. But of goatskins such as clad the ancient hunters, there are almost none; the wool of sheep in which the whole rest of the world is warmly clothed, Armenia must do without. Ragged children and their ill-clad elders sleep in doorways, in stables, anywhere. *The cast-off garments in American attics would clothe Armenia!*

For those *financially unable* to assist in feeding this starving people the advantage of *sending old clothing is urged.* From May 15 to June 15 has been designated as a period for the collection of clothes. Bundle days are to be held in some places, and those active in the relief work urge that clothes be sent to the nearest bundle station or forwarded to the main warehouse, Army Base, foot of Fifty-ninth street, Brooklyn, New York.

It would be possible to multiply indefinitely the instances of Armenian suffering but a few are sufficient for example:

From Alexandropol with the break-up of winter came terrible tales of the conditions in the mountain villages. A New York man who had returned from a five-day horseback ride said that in an area containing 20 villages with a population of more than 25,000 the foodstuffs were exhausted. The inhabitants in desperation were seeking to make bread substitutes from flax, chaff and sawdust. People were extracting indigestible material from old refuse and giving it to the children, because they felt they must fill them. Health conditions were critical, and gastric and intestinal troubles from malnutrition were general. A large percentage of the persons were victims of skin diseases. One-fourth of the adults were bedridden. *Only one in fifty of the inhabitants was normal.*

At that time it was reported that there were 1,500 orphans whose immediate removal to prevent death was necessary. That was weeks ago. Speculation regarding the fate of those 1,500 is needless. Even in the smallest villages the death rate among the children was 10 a week.

In several cases, there have come reliable reports of inhabitants, driven to the verge of madness by hunger, resorting to cannibalism.

Fate in America's Hands

TWO visits, four weeks apart, were made to a family in one little town. There were 15 in the family on the first visit. Three were surviving on the second. The case is not unusual.

Armenia's fate is in America's hands. The generosity which has fed the poverty-stricken and clothed the naked in every land, alone can save this dying people.

If the orphaned children go on to their miserable death, it will be the negligent, the unthinking, the tired, and those who do not care, who pronounce the awful doom. If cannibalism sweeps over the land where first a nation was baptized to Christianity, it will be Civilized America whose offense it is, rather than hunger-mad Armenia. If thousands more of those helpless victims of an undeserved fate perish miserably, it will be our crime.

For those who still remain, there is hope—

Land of Real "Evangeline" a Somber One

"Cajuns," Descendants of Acadians, Linger in Louisiana Swamps

By HARRY E. BARNET

"Ye who believe in the beauty and strength of woman's devotion
List to the mournful tradition, still sung in the pines of the forest;
List to the tale of love in Acadie, home of the happy."

THE beautiful tragedy of "Evangeline" is 75 years old, and Longfellow's death occurred only 40 years ago. But already the clouds of myth, of rumor, and of inquiry, which literary research is always trying to pierce, have enveloped it with mystery as engrossing as that which surrounds the origin of literature centuries old.

Controversy, which began in the East, has waxed warm over the poem, whether its theme was one of fact or fancy. Strong support was given those who contended that "Evangeline" was only a poet's dream child, a delineation personifying the sorrows of the Acadians, to whom Longfellow had given the rhythmic name. Just as warm advocacy came for the contention that there once lived an Acadian woman, the prototype of "Evangeline," but that no person knows what her name actually was.

Hawthorne got the tale, so this story goes, from a minister, who in turn heard it from an old Nova Scotia woman. Hawthorne told the story to Longfellow who was entranced and asked whether the novelist intended to use it. Hawthorne's reported disavowal of the desire is credited by the believers in this tradition with having given the poet the masterpiece.

There is nothing mysterious in the real story of "Evangeline." It is a bit of romantic tragedy that actually grew out of the trust of a girl in a man. Longfellow picked up the facts, draped them with fancy and garnished them with imagination. His version has naturally enveloped the truth. The real story is not widely known, but down in New Orleans the old-timers can tell you in whimsical dialect and with vast pantomime the real story.

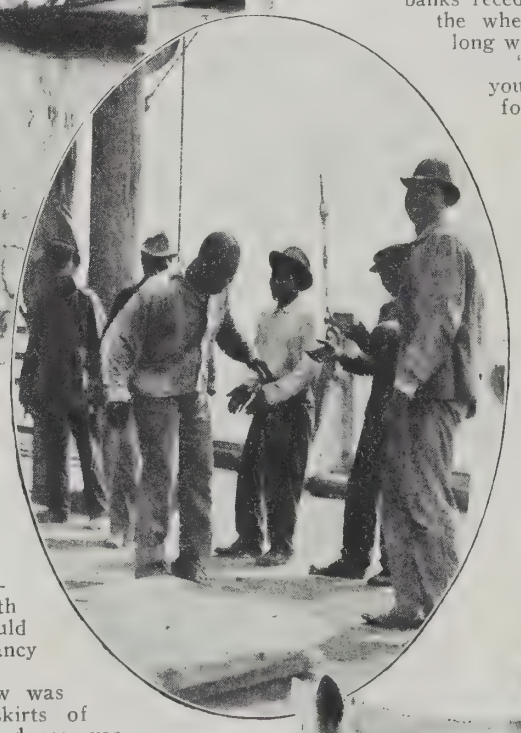
Stripped of its glamour, it is not a beautiful tragedy as Longfellow made it. But it is a tragedy all the same.

It is the story of Emmaline Labische, whose parents died in Acadia when she was a baby. The infant was taken into the home of an old farmer, and reared as a daughter. Louis Arceneaux was her sweetheart from childhood. When Emmaline was 16 their banns were published, and the date for the wedding set. Emmaline was not beautiful, but in St. Gabriel she was counted handsome. Her eyes were hazel, and her hair was a wavy dark-brown. She was slender and of attractive figure.

Before the wedding, came the scattering of the Acadians. Arceneaux resisted deportation, and was knocked down at Emmaline's feet. He was carried unconscious aboard ship, anchor was weighed, and a high wind soon drove the vessel away. From beginning to end of this enforced deportation Emmaline stood dazed and speechless. She watched the ship until it disappeared. Then she shrieked and swooned.

Emmaline and her foster-parents were landed in Maryland. After her grief subsided the girl showed her sorrow. She rejected other men, and changed, until, in the words of the old Acadians, "she looked more like an angel than she did a girl." Gradually, she ceased to be known as Emmaline, and was spoken of as "Evangeline," which means "God's little angel."

Three years after the colony had been landed in Maryland, the Acadians made their way to the Mississippi River, and floated to the Bayou Teche in Louisiana. The French Government gave them the territory for a new home. At the mouth of the bayou the "Evangeline" party were welcomed by former neighbors, who had preceded them. "Evangeline" walked by the side of her foster-mother when the party left their boats, and gave no indication of interest in what was going on. Suddenly she stopped, "as though she had seen a vision from heaven."



"It is he," she cried. "It is Louis."

She ran to a man lying beneath a tree. In her joy she had failed to notice that he made no answer as she asked him question after question. The color left his face. He turned his head, and moved aside. Then the girl realized his silence and his coldness. "Evangeline" nervously repledged her love. His lips quivered as he replied he had pledged himself to another, then turned and walked away. The girl trembled. Her hands became cold; a vacant expression came over her face, and into her eyes. "Evangeline's" reason departed.

The girl never recovered. Her foster-mother was the only person she recognized. Through the remainder of her life she imagined herself to be a girl of 16, about to marry Louis. She spent her days wandering along the Bayou Teche, gathering flowers, and petting the children. She brightened when the church bells rang, and relapsed into deep depression when they became silent. Weakness of mind was followed by weakness of body, and within a few years she died. She is buried at St. Martinsville. Louis married soon after "Evangeline's" arrival, and is said to have lived happily to a ripe old age.

Old-timers in New Orleans say Longfellow searched for material in Louisiana. He was lavishly entertained by grand dames and gentlemen of the old school. They unfolded to him their family histories, without doubt with the hope that the poet would spin a delicate web of fancy about them.

Above—Along the Teche. At the right—A not unusual sight between landings on the Mississippi.

One night Longfellow was entertained on the outskirts of New Orleans. While a dance was on, he slipped out unnoticed and sat beneath a great oak, listening to an old Acadian. In the moon rays, the huge tree, with its far-reaching limbs, cast weird shadows over the poet and his companion. In this setting the story of Emmaline Labische was retold.

"An', so, m'sieu," ended the story Longfellow heard, "for many a year God's little angel, she wander through the Eden of Louisiana, where the Teche nymph chose her playground."

Longfellow took up this simple story of a primitive, insane Acadian girl, and from it brought out the poem. "Gabriel" was named from the scene of its opening.

This, however, is not the end of the truth that lies behind "Evangeline," the poem, if you are of a mind to go adventuring over the trail of the girl through the swamps, along the fantastic waterways, and in the Bayou Teche country, northwest of New Orleans. There is more of the poem spread before your eyes by a body of yesterday's people who are alive today than is true, perhaps, of any other part of standard American literature. You begin to read your Longfellow in waters and environment and in your fellow voyagers when you arrive at the entrance to the Bayou Plaquemine, and go aboard the "Teche boat," a small and stoutly constructed craft that follows the route of "Evangeline."

This boat is very much of a family affair, where:

". . . . they who before were as strangers,
Become straightway as friends to each other."

Before the craft gets under way you are much at home. One evening a young moon hung over the bayou, and several homeward-bound old Acadian women were congregated before the pilot house. They were deep in the discussion of domestic affairs, when the eldest looked up. She stopped and engaged in finger pantomime.

"I was counting the days until the strong of the moon, m'sieu," she said. "I want to set my old hen when I get home. You know when the chickens are hatched during the weak moon they are not strong, and when they are hatched in the strong moon they are healthy and full of life. When I set my hens I always count the days until the full moon, so they will come then.

"And if a hen lays an egg on Good Friday," she went on, "that egg won't rot. I got one seven years ago, and it does not rot. It won't hatch, either."

"Them ol' 'Cajun' women, they'll tell you a lot if you listen to 'em," the boat's pilot remarked.

"Why do you call them 'Cajun'?" was the natural question.

"Easier'n sayin' Acadian, I guess," was the reply. "Same as Injun's easier t' say than Indian."

Bayou Plaquemine is a narrow stream that empties into the Mississippi River not far above New Orleans. The waters are swamp-fed and still; they also are as black as original sin. For hours the boat apparently glides over a lane of pitch, brightened with splashes of vivid water hyacinths. The boat's orchestra brings Negroes of all sizes tumbling out of shacks on the banks until it seems that they must pop up out of the ground; that no shack could hold so many Negroes without bursting wide open. At the frequent landings the Negroes dance on the shore.

All of this is a bit of relief, for "Evangeline" is a somber poem, and an equally somber reality. Around an abrupt turn the prow of the boat points to the country of the Attakapas. In places there is luxuriant wild growth, not unlike the appearance of the entire country when "Evangeline" floated through it, and shivered, perhaps, as she listened to the narrations of the ferocity of these Indians, who not long before had given up cannibalism.

There are bright spots along the bayou. The greater part of its length is well settled. Near the far end its banks recede, and the stream deepens. Back of the wheel of the steamboat the water is a long white swirl of froth on the black water.

"That's soapsuds," the pilot asserts, if you look gullible, "from the soap tree forests away back in the swamps."

Anything that has an appearance out of the ordinary is laid to the swamps; they are a mystery that always provides origins for disease, death and doubt. While the froth was caused by the wheel of the steamer churning the black water, yet it looked strange enough to give rise to a suggestion of uncanny sources.

At the bayou's end is River le Grande. Its waters are as brilliantly yellow as the bayou is glitteringly black. The former stream angles across the end of the bayou and its waters travel at high speed but the waters do not mingle. Into the "forest primeval," River le Grande carries the boat into the melancholy of the actual "Evangeline." Imagine, if you can, a

A rare type of "old-timer" and his mule come to town for the day.

world that is a swamp, uprearing a low, sullen growth that is topped by cypress trees, heavily draped with gray Spanish moss as if in eternal mourning for the little "Cajun" girl, Emmaline. This desolation is crossed by water lanes, and away from them there is only a rare glimpse of the sky through long garlands of growth. The air suggests fearful things lurking beneath pools of greenish water. The boat makes its way for hours through these paths, into which the cypress seems to reach and grasp.

At intervals, the sound of the whistle, thrown about by the trees, becomes like the myriad hoots of gigantic waterfowl. It is not far away from the incident of "Evangeline's" journey, when:

> ". . . . in his place at the prow of the boat, rose one of the oarsmen,
>
> And, as a signal sound, if others like them, peradventure
>
> Sailed on those gloomy and midnight streams, blew a blast on his bugle.
>
> Wild through the colonnades and corridors leafy the blast rang,
>
> Breaking the seal of silence, and giving tongues to the forest.
>
> * * *
>
> And, when the echoes had ceased, like a sense of pain was the silence."

The most interesting of Longfellow's people are in these swamp lands, away from the water lanes. They are the descendants of timid Acadians, to whom the suffering of their forefathers took on a poignancy that gradually became fear of all people, except their own. The ancestors of the people you see there today located their homes in secluded spots where no one was likely to come across them.

These people make their living by fishing, cypress cutting and gathering Spanish moss. Civilization has no appeal for them. Their homes are furnished with the barest necessities, but the life they lead is that of a France that is past. The customs are those of the monarchy in the sixteenth century. At Population Bend, three families muster 67 "Cajuns," who stand on the bank and watch the boat glide by them. Some of these Acadians have features that gave rise to the tale that the climate of North America will, in a few centuries, change European features to those of Indians. These "Cajuns" are the descendants of early-day Acadians who married Choctaw squaws.

Above—The beauty of the Teche. Below—Evangeline's well at Grand Pre, Nova Scotia.

At the door of any of these hidden Acadian homes the mother welcomes you with a kiss. You must remember that your surroundings are something you are likely never to forget. Nine times out of ten, the little cabin is half in and half out of the water, and perched on the slippery mud bank at such an angle that it is forever threatening to slide wholly beneath the surface. Outside, in the yard afforded by a bit of dry land, the woodpile will give up scorpions a foot long, a deadly water moccasin, or a swamp rattlesnake or two. But these people of the swamps pay little attention to the reptiles.

While not over-sensitive, swamp "Cajuns" never forget nor forgive a refusal to eat with them. No man in his right mind would overlook such an opportunity. No colored mammy in New Orleans ever fed her "white folks" crayfish bisque that can equal the bisque that is served in these swamp homes. Yellow fried hominy, browned to the last turn, roast wild duck, and coffee, with which no other coffee can compare—the products are the last word in cooking.

From River le Grande, across Bay Natchez is a wide, shallow body of water, in which the only change, since "Evangeline" traversed it, is the marking of the channel by a series of poles set in the muddy bottom. In the marsh plains great droves of cattle were fattened. When the Mississippi levees broke, and floods came, the cattle were loaded on wide rafts, and taken to higher ground. They grew thin there on the rich grass, and only fattened again when they were returned to the swamps to browse on the foliage. Cattle raising, however, suffered through the bites of reptiles, and lately hogs have begun to replace the cattle. Hogs are immune to snake bites. Their only enemies are wild cats, which congregate on the edges of the hog ranches in great numbers.

In contrast to the width of Bay Natchez is the extreme narrowness of Little Goudels. Even on bright moonlight nights the searchlight of the boat must keep flashing across the water lane, because the trees cast dense shadows. Branches of the trees extend far out over the water, and tear and scratch at the boat like the claws of an army of infuriated wild cats.

The Lower Atchafalaya River is entered near the mouth of the Bayou Teche. At the meeting point of these two streams a little cape extends partially into each. On this cape is a small mound. On the top of it is a small cluster of live oaks. This is the spot where "Evangeline" saw "Gabriel," and where she lost her reason. It is a sacred bit of soil in Acadian history.

There is no more beautiful stream than the Bayou Teche, and a visitor must admit that the Teche and its country deserves its nickname of "Eden of Louisiana."

What Your Town Pays for Those Conventions

Concluded from page 8

of conventions would probably come down automatically if it were not for the new towns constantly getting into the game," said this man. "A community wakes up some morning to find that it has 15,000 population. It pinches itself to see if this is really true, and then begins to plan what it can do to prove itself a regular city. It will become a convention center. Of course, it is not strong enough to go after national affairs, but it will gather in all the state conventions.

"The chamber of commerce organizes a band of its livest wires into a Booster's Club. If it is a seaport town they dress in sailor clothes; if a mining town they fix up as miners with a kerosene lamp on each cap; if a cattle center they masquerade as cowboys. They have a song leader who composes a piece about the home town, and a yell leader who drills them in a unique way to make a noise. Such details being perfected they are ready for business. They have financed their preparations by a ministrel show at the opera house, at which the sale of tickets nearly paid the cost of the show. A good profit was made, however, by the advertising in the program at $50 a page. No advertiser expected any returns, but he was afraid to turn the committee down.

"A state convention is in progress somewhere and this Booster's Club suddenly descends upon it in full regalia, singing its song, shouting its yells, and giving away literature at every turn. It hands out souvenirs representing the home town grain elevator done in ivory-colored plaster of paris, and cigars with an embossed band showing the new Federal building. The convention would have been a dull affair without this unexpected pep, and so it is gratefully voted to hold the next gathering in the home of such a live-wire Booster's Club. The boys go back home exultant; they have put the old town on the map. For a long time whenever they meet each other on the street they stop to discuss how good they are. Other gatherings are obtained and for a few years the town revels in conventions. Then the citizens get tired of subscribing money, a new man is elected president of the chamber of commerce, the yell leader moves away, and the place ceases to be an active contender in the convention field. But another city takes its place, going through the same routine, so there is no slump in convention prices."

In the national field, too, it is the newcomer who keeps things stirred up. When a town gets into the hundred-thousand class it is most likely to sow its wild oats. At that size it feels itself to be a regular city. It builds a municipal auditorium; there is an exclusive ladies' ready-to-wear store; there is a hat-check girl at the principal hotel; the largest jewelry store carries a genuine pearl necklace in stock; business men eat luncheon downtown; the leading newspaper employs a cartoonist; merchants change their advertising copy every day.

Thus having attained man's stature the city in the hundred-thousand class looks round for a quick method of getting itself into the Who's Who of American Municipalities. What can be a more effective way than going after some of the big national conventions? It knows that it will have to pay a heavy price, but it is willing, because it realizes that any new business must spend more money on advertising than its older competitors until it gets itself established. And so it organizes a convention bureau in connection with its chamber of commerce, raises some money to finance it, hires an experienced secretary, and goes boldly out to bid for conventions in the open market.

Recently the representative of a small city laid a check for $100,000 on the desk of the presiding officer at a national convention as its offer for the next year's meeting. There was no such sum of money on deposit. The offer had been underwritten by several hundred men in the city and surrounding towns, who had agreed to put up certain amounts to make the check good in case the convention should be obtained.

The manager of the convention bureau in an important eastern city recently unbosomed himself to the writer. "For 15 years our city has been one of the big convention centers," said this man. "When anything good was on hand we went after it aggressively, and were not afraid to spend money.

"I know we have been paying too high a price all these years. Ours is a beautiful city and we are proud of it; but it is foolish to believe that a business man will fall over himself to come here and establish a factory because we took him on an automobile ride and showed him the fashionable residence section or filled his pockets with booklets descriptive of our public school system and the purity of our drinking water. Nine-tenths of the men who go to a convention are so tied up in business that they could not leave their home town and come to live with us, no matter how much they wanted to. And they come to boost their own town, not to admire ours.

"We are not sore on the convention business. On the contrary we want it just as badly as ever, but we are not going to pay exorbitant prices. In future we are going to spend $1 on each delegate if it is a state convention, and up to $5 if it is a national affair.

"The immediate cash results of a convention to our business men do not amount to much. An excursion from our trade territory will produce more actual buying of merchandise than several conventions.

"I look on conventions as cumulative advertising, rather than a means of present profit. If a man comes to our city and we show him a pleasant time he will always speak a good word for us. And a city needs to do good-will advertising just as much as a business firm. But it wants to keep that in mind when it goes in for a convention, and not be led astray by hopes of immediate returns."

The Women Who Introduce the Paris Modes

Concluded from page 10

attempt to develop a nationality in dress, such as the American dressmaker or tailor does. If clients like what is spread before them, the clothes are theirs. If not, *tant pis!* The garments do not suffer change, and the makers are clever enough to know that once a dress begins to be altered or doctored, *cachet* disappears.

The best designers are employed by the year at the big houses. Some make a living by going it independent. Some work out their ideas not with paper and pencil, but with crinoline, and when the material drapes to please, they ring in the color scheme by dabbing dyed water on the goods. The designers embrace all ages. Very young men are in the field, and their work is daring and risqué. Women largely compose the number, elderly spinsters whose shabby dress and straggly hair would hardly suggest a love for the beautiful and an alertness in outline.

Six months prior to a coming season, the leaders of houses confab—dyers, silk men from Lyons, milliners, dressmakers, and so on, to discuss the size and form of hats, novelties in dress trimming, jet, passementerie, braid—for the dyer must get points in advance of others, and the meet is for him principally. He submits mixtures that have been evolving. If the dyes he suggests have not been exploited for many seasons, if they are attractive and will work into the new silks and stuffs, then his colors become an accepted fact.

Paris has learned that it will not do to run a wild schedule. Colors and fabrics, therefore, are voted long, long before the season opens, but fashions in cuts and detail only begin to be settled in June and December for the August and February openings. As there is almost no business in the dead season, all hands are called in to help with the new clothes.

Speak Only Own Language

VERY few masters or mistresses of establishments speak any language other than their own. Worth and his nephews, who lived long in England, speak English without an accent, likewise Poiret. Mr. Wagner, of Drecoll, knows English, and Mr. Porter, of Redfern, is English. The heads are calm and dignified, unruffled at the clatter that goes on not only in the *atelier*, but in the *salon* in rush season. The confusion and hurry seem a part of the show. *Vendeuses* address each other in a high key, messengers bang doors, and apprentices run madly through the rooms.

Doeuillet is a temperamental sort of man who gets quite excited as he talks of the possibilities of a dress, and becomes wrought up with the mannequins when they are slow changing costumes. Patou is calm enough till he begins to place colors together, then his whole being fires up. He bangs bolts of goods aside that do not please him, he gets in a temper when colors fight each other, but when the problem begins to work out and the dyes to melt into each other, he smiles amiably to all about him.

Monsieur Fritz, of Bernard, appears to fall asleep when everything is in commotion; when buyers are crossing their hearts that if orders are not completed in four days they will be turned down, when *vendeuses* and mannequins are making for each other's eyes, he stands back to the wall, eyes closed, and features relaxed. He is thinking hard and planning close.

Jenny, who in private life is Madame Sacredot, is probably the only religious member of the sartorial band. Madame is deeply pious and looks it. She speaks softly and slowly, she generally dresses in black, and her face is the face of a Madonna. This dressmaker attends mass every morning no matter what the weather, and when her girls have a moment off, they are embroidering vestments for the altar. At the Sacredot villa in the country, one of the richest and most finished corners is the chapel. During vacation weeks, many of the clergy are guests of M. and Mme. Sacredot.

Doucet might be termed the classic member of the group. Only the highest culture satisfies him, and only *élite* objects surround him. His home, in one of the most exclusive quarters of Paris on the rue Spontini, is one of the most refined. Monsieur has always been a student.

Scarlet Tie, Green Vest

PARIS *couturiers* are not only well groomed and dressed, but have great charm and polish of manner. Doucet, Wagner, Doeuillet, any of these, is admired because he knows how to dress. Poiret resembles his creations at long range. He is foreign in air, though just what country he represents is not divulged. He may wear a scarlet tie, a green brocade vest, brown and white trousers, orange gaiters, yet be nothing but mysterious and picturesque.

The women dressmakers are not characterized either by elegance or *cachet*. They belong to workers who, making other women smart, do not cultivate their own loveliness. During the most successful season the *couturières* are most dowdy. There are exceptions to the rule, and Mme. Paquin and Mlle. Vionnet are so chic they make amends for those that are not. Mme. Paquin loves finery and enhances any of her own creations. Her white hair makes her very aristocratic, and her ruddy coloring blends in with any shade of goods. Vionnet is quite smart, Chenal very *Parisienne*, these two latter being the youngest and sprightliest of the lot. Both wear their own modes, and at the races are among the stylish women present.

Jeanne Lanvin and her sister are like Irish women of old engravings, of a day when a fine suit of hair was considered a crown of glory. Both women are blondish, with big plaits of reddish fluffy hair coiled loosely about the head in the old-fashioned way. The sisters insist on wearing styles of other days rather than those *au courant*. They are fond of ruffles, of baggy sleeves, of soft lace about the throat, and in clinging to the past, show that they can rise superior to the law they lay down for other women.

Jenny, one of the youngest of the bunch, is quite *dame* no matter what her costume, but she does not take much interest in what she wears, though her saleswomen and mannequins are noted for their lovely clothes. The lamented Mme. Lefranc, who designed and helped make Premet famous, enjoyed being in beautiful things, though like many of the smart *Parisiennes*, she had a penchant for black, and satin was her costume for winter, taffetas for summer. Her skirt always hung in soft plaits and it was she who in old days designed trains, then showed her clients how to lift the long dress and hold it with one hand. Had it not been for lessons of Mme. Lefranc, trailing robes would have had far less importance.

The poorest dressed mannequin easily outshines her employer. The young thing puts all she makes and a deal more on her back. Apparently, none of the *couturières* have the sums to spend on clothes the mannequin has. The girl is a butterfly and butterflies must fly in sunshine and sport lovely raiment, else they will fall to mediocre, and the mannequins, who are not famous for intellectual equipment, appreciate the fact that their faces are their fortunes and so give the face the best setting they can.

Margot, the most celebrated of them all, died a few months ago. Margot launched not only clothes, but headdress. It was she who persisted in the mountain-high coiffure till *tout* Paris adopted it. Margot had a certain *beauté du diable*, and wore any frock she put on with a dare that made it stunning. In spite of *"la noce"* she is said to have made continually, her complexion was marvelous and did not need the splashes of red.

Corinne is a mannequin who in looks and manners would grace any gathering. She has a Grecian profile and cast of features that make her more classic than beautiful, also an air that is convincing. Corinne gazes at you from her five feet seven height with a sweet disdain that fills you with conjecture and envy. She is naturally haughty, but the accentuated manner of carrying out the pose—in which the chief of the dress brigade trains the girls to move about the salon—is cultivated. The others gyrate. Corinne acts. She has the will power to keep herself "drawn up," and to carry out the pose which her companions, meeting the critical eye of the buyer, get stage fright and forget.

One Mannequin Not Comely

SUZANNE is the only successful mannequin who has not a comely face. She has a snub nose and a sallow skin, also she has individuality. Her girlish form is still with her, and she has learned not only how to wear clothes but how to use cosmetics and wigs. She was only an apprentice passing through the salon on an errand late one afternoon, when the commissioners happened to be there. The men wished to see the hang of a certain gown. The mannequins were gone. A *vendeuse* suggested that Suzanne fasten on the dress, and Suzanne did. She wore the things so well and was so amiable that she became a mannequin.

Neither young nor good looking, Suzanne makes up by being gracious and self-effacing. The other girls often pout. They refuse to put on models after work hours, but never Suzanne. She promenades leisurely, and displays the garments in all lights, and, though fatigued from putting on and taking off, comes in with a smile that lays bare a snaggled front tooth, with the tip of a tongue that threatens to break through.

Running across the mannequins on the avenue after the establishments have closed, one would suppose one was viewing society girls issuing from tea or from a *cours de danse*. Some own motor cars and some don't, but all like to promenade and enjoy the comments their appearance always creates. Spick and span they are, in silk hose neat gloves, modish shoes, rich fur. You would never think them Cinderellas on their way to a cheerless home. Yet a few (very few, it is said) know what misery and poverty are like.

The American Massacre of the Royal Chinook

Concluded from page 6

the goose that laid the golden egg appears a wise economizer.

An author whose name is not now recalled makes one of his characters say: "The more I see of some men and some dogs the more I think of dogs." So, the more I read of some men and some fish, the more I think of fish.

Oregon has a law forbidding the operations of the trollers and purse seiners. After the manner of their kind the world over they have challenged the constitutionality of the law. The law has been sustained by the state supreme court and the abuse—as far as Oregon waters are concerned—was stopped January 1, 1922.

The conditions just outlined point to the need of remedial legislation and of artificial propagation. Legislation has been enacted. And the work of artificial propagation, begun years ago, has grown to large proportions.

Owing partly to the usually enormous catch of chinook salmon and partly to the fact that it is readily susceptible of artificial propagation, especial attention has been paid to the growing of this variety. The work of artificial propagation is nowhere more efficiently carried on than along the Columbia River. And since artificial propagation is the main support of this important field of food production, it will be found of interest to study it briefly.

The largest of Oregon's salmon hatcheries is situated in the Columbia Gorge near the village of Bonneville, and there many things of compelling interest await the investigator.

The fish from which eggs are taken for artificial propagation are captured on their way upstream to the spawning grounds and confined in ponds at the hatchery. A rack or trap is usually employed in catching them. Once in the ponds they are brought within reach by the use of a seine.

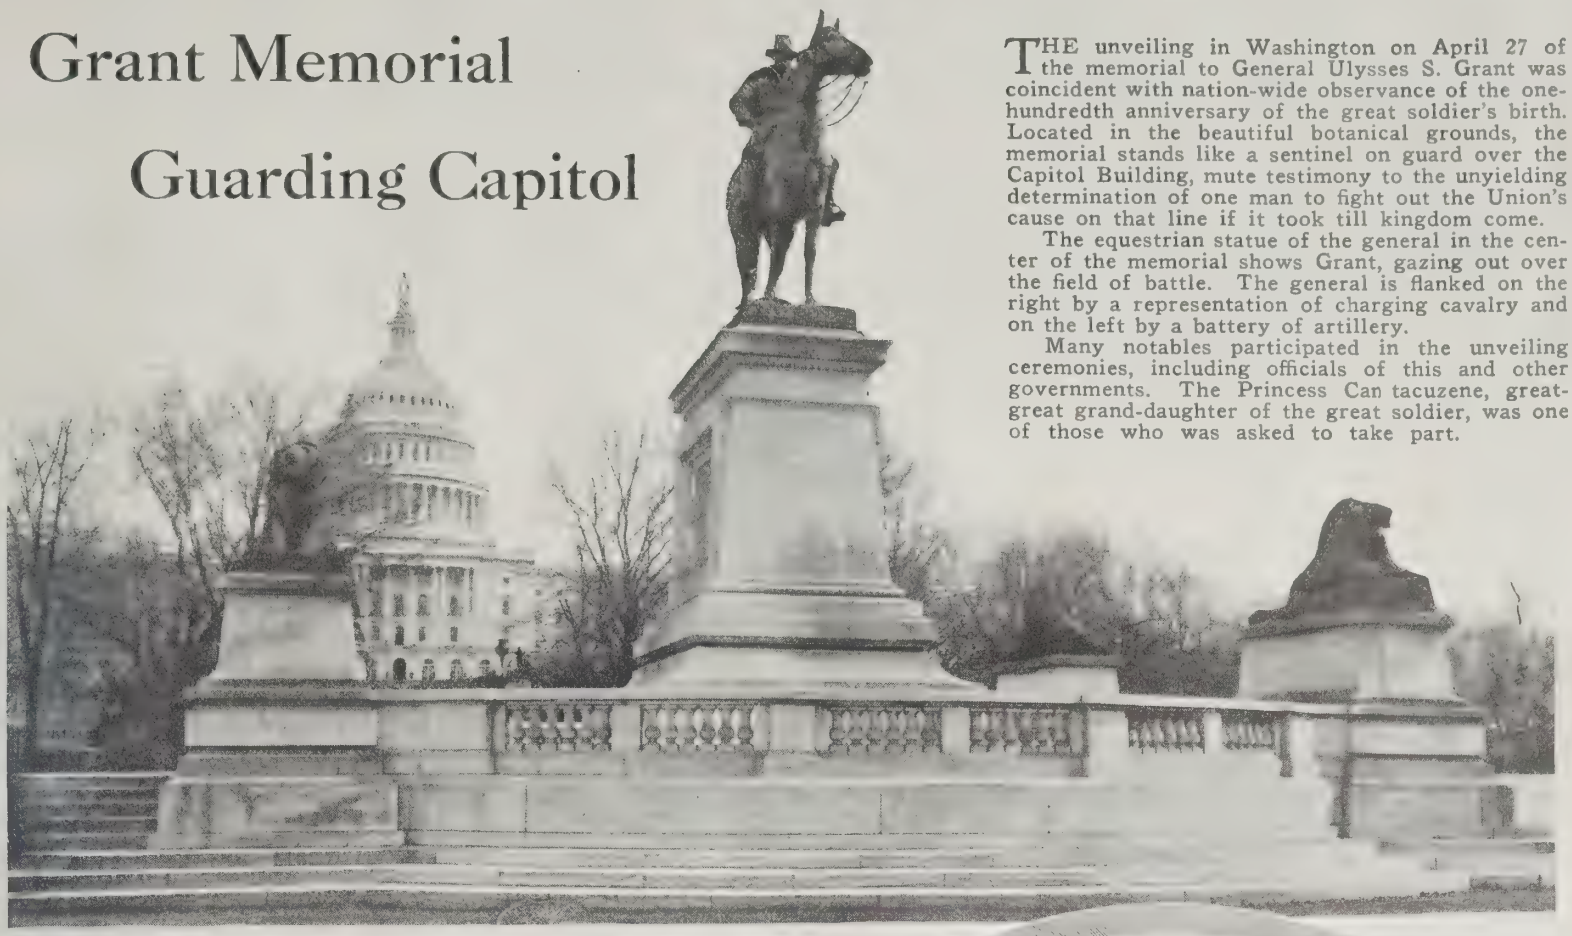
For incubation the eggs are placed in wire-cloth baskets each containing from 20,000 to 30,000 eggs. The baskets are placed in a trough arranged to insure the perfect circulation of the water through the mass of eggs. The period of incubation is about 50 days. After the eggs are hatched the interior arrangement of the troughs is changed by partitions dividing the space into three equal compartments for holding a certain proportion of the fry. It is necessary to make this provision to guard against suffocation which frequently occurs when the fry are allowed to mass together.

The routine methods followed in the care of the young fry are much the same in all hatcheries, and need not be described here. It is only when men of vision develop out of the usual routine new and more efficient methods, that their work deserves attention. That is precisely what has been done in Oregon in the rearing and feeding of young salmon.

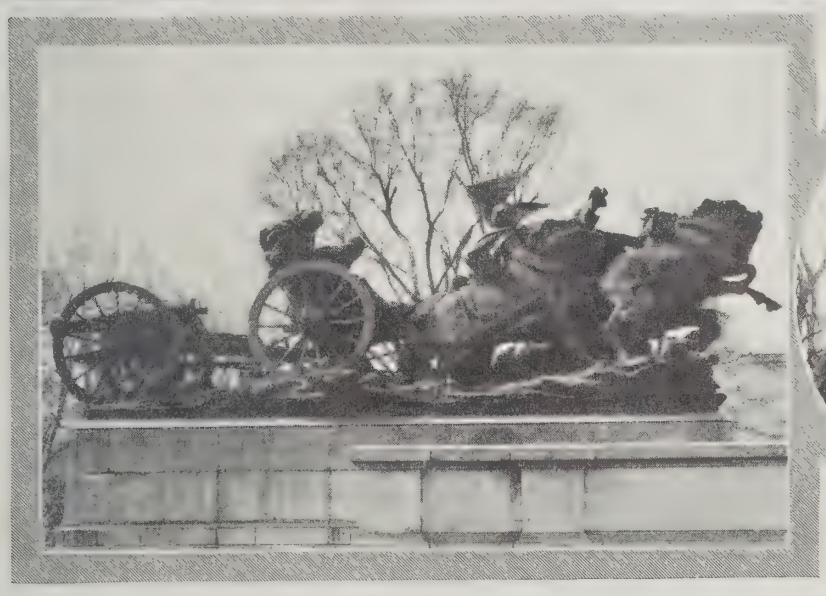
In the artificial propagation of salmon it has been the almost universal custom to turn the young fry into the streams soon after the egg-sac which supplies food to the baby fish has been absorbed. This handling of the fry exposed them to precisely the same dangers as those which confronted the fry hatched on the natural spawning grounds. The losses which followed were reflected in the falling off of the pack of salmon in the Columbia River from 634,696 cases in 1895 to 266,479 cases in 1913. Meantime, the Oregon Fish Commission in 1909 undertook an experiment which has since become an established practice in the rearing and feeding of salmon.

The "Oregon System" is simplicity itself. It consists first in the exercise of extreme care in the selection of food for the young fish and in the feeding of them, that they may have a healthy and vigorous growth, and second, in holding the young fish in rearing ponds until they are about one year old. By that time they are able to take good care of themselves.

This plan was scoffed at as a "fool idea" by the fishermen and canners generally. It received its first real tryout in 1910 and since the salmon requires about four years to reach maturity, its efficiency could not be measured until 1914. In that year to the amazement of the scoffers the chinook "came back" and the Columbia River pack went up to 455,502 cases, or nearly double the pack of the year before. The Oregon system of rearing and feeding had made good.



Artificial propagation properly carried on will offset the losses which accompany natural propagation and insure the production of a sufficient number of mature fish to guarantee the maintenance of the industry. It remains only for an enlightened public sentiment, here as in other fields, to initiate and support such legal measures as will stop the ravages of unprincipled commercialism and leave a clear field for intelligent and constructive effort.



Grant Memorial Guarding Capitol

THE unveiling in Washington on April 27 of the memorial to General Ulysses S. Grant was coincident with nation-wide observance of the one-hundredth anniversary of the great soldier's birth. Located in the beautiful botanical grounds, the memorial stands like a sentinel on guard over the Capitol Building, mute testimony to the unyielding determination of one man to fight out the Union's cause on that line if it took till kingdom come.

The equestrian statue of the general in the center of the memorial shows Grant, gazing out over the field of battle. The general is flanked on the right by a representation of charging cavalry and on the left by a battery of artillery.

Many notables participated in the unveiling ceremonies, including officials of this and other governments. The Princess Can tacuzene, great-great grand-daughter of the great soldier, was one of those who was asked to take part.

Above, in the center, General Grant is shown mounted on his charger in the center of the memorial, the Capitol appearing in the background. Below, at the left, is shown a gun, with its caisson, horses and soldiers, while cavalry with its standard is shown on the right.

Blind Man Leads Blind Through Braille Bible

Concluded from page 9

very slowly until further funds have been secured.

Seated in his little library composed entirely of reading matter in Braille, the major part of which he himself reproduced, the strong and supersensitive fingers of the blind publisher unhesitatingly selected such volumes as he wished to show the writer. With equal dexterity he selected a letter from his files which he wished read.

"I feel no handicap whatever," Mr. Atkinson declared, "and when I realize the difficulties and discouragements which the blind have met in any attempt to obtain spiritual enlightenment, when I think of my own case and the patience and persistence required on my part, I am filled with a deep resolve to do what I can to make it easier for those similarly afflicted who follow after me. This Bible work is the first step. To help the blind overcome their handicap, there is no better auxiliary than in their reading. The embossing presses in this country are operating to full capacity, and yet they are not able to meet the rapidly increasing demand for literature in this uniform code. It is one of my greatest desires to publish on the Pacific Coast a weekly or bi-monthly magazine in which shall appear current events and good, wholesome literature."

The blind of this country cannot depend on the Federal Government for a great volume of reading matter as only $50,000 a year is appropriated, this sum to be used exclusively for text-books in the existent 56 schools for the blind. This appropriation divided among all the blind would average about 67 cents a person, an insignificant sum in the costly production of books in Braille. For instance, an ordinary ink-print pamphlet sells at a profit of 10 cents, the same item embossed for the sightless ones to read, must be sold at a dollar or more to obtain actual cost production.

California's State Library in Sacramento has the third largest free circulating department, for the blind in the entire country, the Department for the Blind in the Congressional Library at Washington and the New York City Library being the leaders.

Although he attended no institution for the blind, Mr. Atkinson has mastered four of the five systems of Braille, named after the Frenchman who invented embossed writing by the use of six dots. The European Braille is the simplest type of all but exceedingly bulky; the Boston Line Letter is simply the English alphabet in raised lettering which is not only bulky but difficult to follow; the New York Point is a system of two dots wide, whereas the Revised Braille is three dots wide; the American Braille is the revised European Braille; the Moon System is that which all beginners are first taught. The newly adopted Revised Braille is most agreeable to the average reader.

It was from reading the *Ziegler Magazine* that Mr. Atkinson's career as a publisher had its inspiration. He learned of a typewriter for embossing directly on paper. A machine was ordered by him. It worked but poorly. Still Mr. Atkinson succeeded in embossing various works while at home with his mother in Imperial Valley, of Southern California. He was compelled to treat the back of the pages with white shellac that the dots might be more firm, and to develop a binding by which the individual pages embossed on the typewriter could be fastened into a book with sufficient space between to prevent the dots being crushed.

In 1915 through contributions of friends, a new and larger typewriter was procured. The problem of suitable paper became a serious one during the hot season in the Imperial Valley, for the extreme heat took the moisture from the paper so that it became so dry and brittle that the stylus on the machine instead of making dots punctured the paper.

Today, placed among a group of business men, for no reason would this blind publisher be conspicuous since he has acquired a remarkable poise. He can go and come at leisure, board street cars and visit outlying, unfamiliar cities unassisted, and with less difficulty than the average wayfarer experiences. Last fall Mr. Atkinson made the trip back to New York and Boston alone. At times he has even set his wife aright when she was starting in the wrong direction. This happened once in a strange city when Mrs. Atkinson had lost her bearings and her husband sensed the proper turn to take.

URBANA ILL

BRIEFLY TOLD

The first canoe trip through the Panama Canal was recently completed. The 48 miles was made in 10 hours and 55 minutes.

Furs from the Hudson's Bay Company at Cartwright, Labrador, are being sent to the fur markets of the world by airplane. Owing to the late opening of navigation, the fur would not have reached the market until October, but the planes carried it to St. Johns, Newfoundland, in a day.

Anesthetics were known and used by the Chinese thousands of years ago.

Among the married children of Tokyo, census takers have located 44 grooms whose ages range from 14 to 15, and 145 brides under 15 years of age.

The only new buggy in the state of Oregon, as far as leading vehicle houses of Portland were able to find, has been sold at a little town in the interior of the state. Inquiries were sent to Pendleton, Salem, Eugene and Medford from Portland but no new buggies could be found. At last one was purchased at a store in a small town by a Portland vehicle house.

In the hope of building up a sturdy race the government is aiding the back-to-the-soil movement for native Hawaiians. A demonstration farm is in operation on Molokai Island.

The "Museum of Hate" is a new section of a French war museum in Paris, filled with German documents and medals collected since the armistice.

An act recently passed by the Argentine Parliament prohibits the consumption of alcoholic beverages in any building occupied by a firm employing women, persons under 18, or children.

English boys between the ages of 15 and 18 are wanted in South Australia for farmer apprentices. They are to be paid four shillings a week pocket money, the remainder of their earnings to be placed to each lad's credit in the state treasury at four and one-half per cent interest, the entire sum being turned over to him at 21.

France is issuing new 50-centime coins in bronze aluminum.

The Navy Department estimates it will cost $2,800,000 to offset the damage done dikes, wharves and quay walls, by the teredo. The teredo is a marine animal, a bivalve, which bores its way into a pile. Teredoes sometimes reach four feet in length and of the thickness of a man's thumb.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

Many elks have been killed in the Olympic peninsula of Washington to obtain teeth for lodges. Investigations made through Federal and state agencies indicate that 100 were killed in the Olympics alone to secure teeth which are sold in eastern cities for as high as $50 each.

Fifteen clergymen are working as floorwalkers in New York City department stories to eke out their meager salaries.

Lightning struck and demolished the belfry of the cathedral in the ancient city of Nepi, Italy, while 2,000 parishioners were listening to a sermon recently. No one was injured. The cathedral was built in the fifth century on the site of the ancient temple to Jupiter.

It has been found that certain kinds of paint on the walls of auditoriums do away with objectionable echoes or greatly soften them.

Coal-tar possibilities are far from exhausted, according to experts. New remedies, new colors and new perfumes are awaiting release and in the next few years many new products are predicted.

Mammoth Cave, of Kentucky, may be sold under the hammer. The 3,000 acres at the entrance to Mammoth Cave are in private hands under the terms of a will, which dictated that the land must be held in trust until the last of the named heirs died when it is to be sold at public auction in its entirety.

Oil burners are to be installed on the locomotives of the state railways of Argentina. Petroleum will be sold to the railways for 27 pesos a ton delivered in Santa Fe. The present fuel, quebracho wood, costs 12 pesos a ton and it is estimated that a ton of petroleum will equal four tons of quebracho, making it possible to conserve this valuable lumber tree.

Coal is being mined under the sea off the coast of Nova Scotia. The mouths of the mines are on shore and tunnels are driven through the coal under the water. Great care must be taken to prevent inundation from the sea, and the mining engineer takes care not to break or distort the strata lying above the coal seams.

After being rejected by the Upper House 15 times, a bill prohibiting the sale of intoxicating liquors to minors was passed by the Japanese Diet recently.

The battleship Maine, built to replace the one sunk at Havana, is to be scrapped and turned into plowshares. A Philadelphia firm is said to have purchased the warship for less than $100,000.

Such words as "wine" and "beer" and the names of other intoxicating drinks are recorded as "obsolete" in the revised edition of the Encyclopedia Americana.

Under the direction of archeologists, excavation work has now begun on the Taurine Baths, four miles from Civitavecchia, near Rome. Two-thirds of the baths are under ground. They were begun by the Emperor Trajan and remained in use for four centuries. They had a large central hall with reading rooms, beside the baths.

Sacramento, California, is importing the mosquito-catching top minnow which will be placed in ponds in dredger pits. The minnow is being brought by the state board of health in the campaign against malaria.

An instrument has been devised at the Oregon Experiment Station to indicate just when pears have reached the right stage of maturity for eating, canning or shipping. It consists of an apparatus which measures the pressure required to punch shallow holes one-half inch in diameter in the flesh of the pear. Bartlett pears requiring 35 pounds pressure to make the perforations are ready for picking and for long-distance transportation.

You cannot poison a hen with strychnine. Chickens' and wild gallinaceous birds are practically immune from this poison.

Italy will have a total of 1,811,300 hydro-electric horse power capacity when new central stations under construction are completed. This is double the amount five years ago.

Chicago is planning to establish a night marriage license bureau. Many persons actually cannot spare the time to obtain a license during the working hours and hesitate about taking associates into their confidence when asking for the time off.

Herbert Ward—An Artist and Adventurer

Primitive Life Mirrored in Collection of African Sculptures Left to Smithsonian

By D. JAY CULVER

PRIMITIVE life is mirrored in a remarkably interesting collection of African weapons and original sculptures left to the Smithsonian Institution in Washington by the sculptor, Herbert Ward, the last survivor of the famous Stanley relief expedition in Africa. The collection includes a splendid assembly of relics—knives and spears, musical instruments, ivory carvings, a huge elephant's head, and several hundred little wooden idols. More important, however, are bronzes that Herbert Ward made when he returned from the Congo. Theodore Roosevelt, who visited his studio in Paris, said: "In his figures the Negro of the Congo is seen on his native soil, child-like and cruel, friendly and brutal, age-old man who lived in Europe several thousand years ago, and yet a man with eternal youth in his soul that has preserved him in his stalwart strength to the present."

Turning his back on civilization in 1885, Herbert Ward penetrated to the heart of the dark continent. He found the natives in a savage state corresponding to that of our neolithic ancestors of 3,000 years ago. They had no written language—no knowledge of their past—no conception of time. Home life did not exist. The women and the very young children lived together, but the men led a primitive club life of their own. Highly superstitious, they lived in constant dread of their charm-doctors. They engaged in perpetual warfare. They had learned the secret of smelting iron ore by means of charcoal fires and primitive bellows and every member of the Congo tribes was more or less able to make his own weapons.

Ward, young, full of life and high spirits, regarded every one he met as his friend. He entered into the lives of the natives and even learned their language that he might know them better. In the preface to one of his books on his experiences in the Congo, he wrote, "It was no high motive that took me to Africa. I went there simply and solely to gratify my love of adventure."

Born in London in 1863, he ran away at 15 to escape the business career that his father had mapped out for him. Before he was 20 he had sailed around the world three times. In the course of his travels, he visited New Zealand, Australia, and unexplored parts of Northern Borneo. As an undergraduate in the University of Hard-Knocks, he was in turn a sailor before the mast, kauri-gum digger, coal miner, sail-maker, newspaper reporter, herdsman and acrobat with a traveling circus. These adventures only whetted his appetite and led him to Central Africa, where he passed the five most impressionable years of his life. At the end of his third year, he grew weary of Africa. There seemed little, if anything, to tempt him to remain further. Just as he was about to sail for England he heard of Stanley's arrival to command the Emin Pasha relief expedition and his feelings underwent a sudden change. He cared little or nothing for Emin Pasha but life with the great explorer promised new experiences and unheard-of adventures. On his own initiative, he collected a band of more than 400 native carriers and marched with them to meet Stanley, placing his and their services at the great explorer's disposal. Stanley accepted his offer gladly and enrolled him as a volunteer officer of the expedition. In spite of his extreme youth, he was placed in charge of Stanley's rear-guard, and two years of unceasing and exciting work followed. He has related his experiences in three books, "My Life with Stanley's Rear-Guard," "Five Years with the Congo Cannibals," and "A Voice from the Congo."

In the last mentioned, he wrote: "What an inexpressible charm there is in picking one's way through localities that have never before been visited by a white man; seeing strange faces and hearing strange languages! To be alone where nature and human nature are alike in a crude state; to be far away in the midst of a primitive people whose nature is wild and uncultivated—people who are simple, savage in ignorance, timid, and ever fearing for their lives. To be the one delegate, as it were, of the modern world, in the midst of countless thousands of human beings whose minds are the minds of primitive mankind. To live free of all the petty conventionalities and ramifications of civilization; to be able to forego all the artificial necessities of our modern home life; to give free play to that strong, inward craving for true natural liberty—these are some of the subtle attractions that inoculate every man of African experience; these are the charms which cast their spell upon all African travelers, and which have held so many of them fascinated for the remainder of their lives."

Top—"The Fire-Maker," one of the fine bronzes in the Herbert Ward African collection. Left—"The Idol Carver." Right—"Defiance"—the most characteristic bronze in the Herbert Ward collection. Bottom—"The Congo Chief."

The Congo pioneers were men representing many European nationalities. They entered among the Pagan Negroes filled with high ambition and enthusiasm. They always looked forward to their return to Europe and the comforts of civilization but as the months sped by, many sickened and died, victims of privation and fever. A few of the hardiest survived long enough to complete their term of service and to embark for home, but they were generally broken in health. By some miracle, Herbert Ward recovered from a severe attack of fever and continued his work without further interruption. Several times he narrowly escaped death. Once he dived from a little steamer in which a party was traveling on the Upper Congo. The moment he reappeared on the surface of the water, he could tell by the expression on the faces of his friends that danger was in his vicinity. With two or three strokes he reached the vessel's side, and as he clambered aboard hastily a large crocodile bumped heavily against the iron sheathing, just at the spot where he had left the water.

Ward spent much of his spare time in Africa in making notes, studying the language, and sketching native types. This latter was rendered difficult upon occasions by the natives frequently entertaining an idea that his searching glances and mysterious markings were connected with the casting of a spell; and they would jump up and dash away without warning. The natives admired any exhibition of personal strength, skilled endurance, and the white man who could shoot an elephant or walk some tremendously long distance was sure of winning their regard. Herbert Ward earned the title Mayala Mbemba, "The Eagle's Wings," for having accomplished a journey of 40 miles over a wearisome and fatiguing road in a single day. The average day's journey on the road in Africa was from 10 to 12 miles. Upon hearing of Ward's 40-mile hike, one of the natives exclaimed, "He must have eagle's wings!"

HERBERT WARD

The name struck their fancy and it stuck to him as long as he remained in Africa.

His first serious work in sculpture was the head of an African chief. It was exhibited in the Royal Academy and a replica was shown in the Salon des Artistes Francais. It proved too exotic for the staid British institution but it met a far different reception in Paris. It was awarded an honorable mention and later purchased by the French Government for the Luxembourg.

In 12 years he produced 18 bronzes and exhibited them at the Salon, where they received high commendation. About five years after

Cypress Celebrated in Legend and in Fact

Famous Wood of Swamp Owes Longevity to Vegetable "Smallpox"

By HARRY E. BARNET

THERE is a distinct wood of literature. It is cypress. In literature cypress has the best of the mention whenever the element of romantic and historic interest falls in with wood and timber.

Among the most delightful stories ever written are those in which the scenes are laid in and around big ante-bellum houses of the South. These homes, for the most part, were built of cypress, because it is the only wood that gracefully grows old in that climate, and these homes were built to shelter generation after generation. Hence, the southern structures still are massive. Age has not turned them into uncomfortable half-ruins. If you examine the Scriptures, and look through ancient history, you find that where wood is mentioned by name it is cypress, though for a time cypress was known as "gopher wood," and "beroth," as well as "berosh."

From the birth of literature the bulk of written matter treats cypress from the symbolic standpoint, or allegorically. But there never is absent the suggestion of hygiene, of fragrance, of steadfastness, of endurance, and of mystery, especially of mystery, for two reasons.

Cypress is a swamp tree. Swamps where it flourishes are mysterious places—breeding spots of fevers and of pestilential bugaboos that through centuries have been personified as demons, who stalk about, dripping disaster and death wherever they go. Swamps mask real things equally as horrible. A typical cypress brake is heavily wooded. High above the tangled undergrowth that half conceals the sluggish water the trees rear their plumed tops. Undergrowth and trees are festooned with Spanish moss until the swamp is dark, and it always is sinisterly still. Moss - bedecked dead cypress trees mingle with the living, and the look of them is gruesome like that of corpses, were they to arise from their graves, and draped in their funereal clothes, move about among the crowds on the street. It was out of a cypress brake near the Mississippi Delta, that Lafcadio Hearn got one of his best stories in the days when he was a hack writer in New Orleans, writing about Southern Louisiana. Spanish laborers were excavating a canal on the edge of a cypress swamp when one of them uncovered the body of a beautiful young woman. Her flesh was soft and white. With visions of a brutal murder, the laborers fled from the spot. When they returned with their superintendent the excavation was filled with bodies of men, women and children, all of perfect figure, and glorious in their beauty. The superintendent soon discovered that the bodies were a sort of a root, whereupon the laborers cannibalistically devoured them. Hearn unearthed a Creole legend that these bodies were man-root that made its appearance once each century in the swamps. Then he wrote the story.

But matter-of-factness soon stepped in with another version of the episode. The man-root of the story was the root of a cypress that a laborer unwittingly and fantastically skinned with his grubbing hoe, so that under the blood-curdling spell of the swamps, to the laborer the cypress root took on the appearance of a human body. The man-root story, however, will always live.

Swamp literature of cypress is nothing if not hideous. You learn a good deal about snakes, for cypress brakes are alive with deadly serpents —rattlesnakes and moccasins, and other varieties. These reptiles have been the basis for many Negro tales that writers of earlier years delighted in putting on paper. For instance, there is the "horn snake." According to these tales, this serpent grows to immense size. At the end of its tail it has a horn. When angered it strikes man, beast and vegetation, even grown trees, with the horn, and whatever is struck immediately withers and dies. Old Negroes believe that all of the dead trees in a cypress brake have been struck with the horn of this snake. But common sense steps in and insists that the "horn snake" is really a very harmless reptile. Its average length is from two feet to two feet and a half. Its back is dark brown or bronze color, while its underside is striped with red, like the belly of a red-banded water snake. The body is fairly slender, and the tail ends in a sharply pointed stinger, or horn, dark and very hard.

Other swamp literature of cypress deals with untamed runaway slaves who found refuge in the cypress brakes. In this literature are the vivid descriptions of voodoo festivals with the great snake of voodooism always present.

A reason for the mystery about cypress is the form of its growth. It has a swollen base. Its roots are always under water, so they send up protuberances above the water, which are called "knees." The deeper the water the higher are the "knees." Consequently, a cypress brake has a curious appearance, for the "knees" are of all sizes and heights above the water. The theory is that the tree "breathes" through its "knees," or, in other words, that its roots are aerated through these protuberances. In the history of bee culture you find the details of the use of cypress "knees," which are hollow, by the Negroes as bee hives. Then the "Old Family Doctor Books" tell of resin from the bark and cones of cypress and its "knees" that is the foundation of an excellent salve.

Turning back to ancient times, cypress was sacred to the Greeks. In their mythology it is said that Apollo loved a beautiful youth named Cyparissus. The latter was changed into a cypress tree that he might mourn for all time. The Romans reverenced cypress. They carved their laws on slabs of it. At about the same time statues of gods and other people were carved from this wood. Pliny mentions a cypress statue of Jupiter six hundred years old. The Egyptians encased the greater number of their mummies in cypress. Practically all literature about Egyptian mummies is centered on bodies boxed with cypress. The latter were practically the only mummies left when investigations began, for cypress is the wood that outlasts all others.

The longevity of cypress is due to two factors: It manufactures its own preservative, and about one-third of the trees have a sort of vegetable smallpox. When they recover they are immune to rot. The disease is caused by a fungus which gets into the living tree through broken branches, or dead tops and decaying knots. The fungus excavates holes in the tree from a quarter of an inch to an inch in width, and sometimes several inches in length. These holes fill with a brown powder, produced by the fungus, which acts as an antiseptic, and finally kills its parent. Then the disease is over. A tree afflicted with this smallpox is said to be "pecky," and slabs from it have the appearance of a pock-marked human face. Cypress trees, "pecky" at the heart, have continued to grow for 1,800 years. The preservative is an essential oil. The oil and the "peckiness" cause the durability of the wood. The stability and the ease with which it is shaped were reasons enough for the ancients to reverence it. They had to fashion their wood laboriously with crude instruments and they wanted their handiwork to last.

Noah built his ark from cypress, though the wood was given another name. The Carthaginians and the Phoenicians built ships of cypress. In 1714, John Lawson published a volume descriptive of the development of the resources of North Carolina. At that time yellow poplar was considered to be the best wood from which to make dugout canoes. But the Carolinas are south of the yellow poplar belt, and the next material at hand was cypress. Accordingly, the only canoe used at that time in the river and coast commerce was the cypress dugout. Some of these canoes carried 30 barrels of produce be-

A Dead Issue

FROM time to time, upholders of liquor traffic attempt to extract comfort from the results of elections held in various parts of the country.

Recently a supreme attempt was made to interpret the result of a congressional by-election in New York State as indicating a pronounced swing toward legislative tempering of the prohibition enforcement law. In a Republican district, the Republican nominee was returned to Congress by a greatly reduced majority. It happened that in this instance the Democratic nominee had made opposition to the prohibition law a point in his platform. There were several other factors in the election, a reduced vote, disgust over congressional do-nothingness, the aftermaths of financial depression, and the usual local group vote alignments.

But anti-prohibitionists ignored all other factors and loudly ascribed the reduced Republican majority to dissatisfaction with prohibition.

A few weeks later, however, the primary election in Indiana was held, and anti-prohibitionists remained discreetly silent over the election. Samuel M. Ralston was nominated for Senator by the Democrats by an overwhelming majority. One of his opponents had made the campaign solely on the anti-prohibition issue, and had been snowed under so badly that it was not worth while to count the votes. In several of the congressional nominations, other anti-prohibition aspirants had fared as badly.

The truth of the matter is that the public will not consider prohibition as a live issue. Even those persons who profess the belief that the prohibition measure was a mistake refuse to let any worry over its passage interfere with their 1922 digestion. Prohibition as a fundamental policy is settled, and the politician who tries to urge its repeal is arguing an issue as dead as slavery.

Governments and the Money Trust

AFTER many years' study of the money question, it still seems strange that the governments of civilized nations continue in this age to allow private individuals or corporations to own and operate the public utilities known as banking institutions. Many people seem to labor under the delusion that the Government of England owns and operates the Bank of England, exercising complete control over the business and affairs of that institution. So also of the relations between the French Government and the Bank of France and of the German Government and the German Imperial Bank, or Reichsbank, of Berlin.

There are even many Americans who look upon our own "national" banks and "Federal" Reserve banks as government institutions. It is impossible to escape the impression that, in this choice of names as in other particulars, the actual private owners of these banks have deliberately sought to stamp this wrong impression on the minds of the people, few of whom stop to look below the surface. We are a law-abiding people and hold the authority of our government in awe. The banks undoubtedly derive much prestige and authority, to which they really have no claim, from the widespread notion that they are really government institutions.

This deceptive notion gathers some force from the fact that the banks exercise what is declared by the Federal Constitution to be a distinctively and exclusively government prerogative in the coinage and issue of the people's money. That practically the whole volume of the circulating medium happens to be paper rather than metal does not alter the fact. It will hardly be seriously contended that the stamp of a steel plate on paper is any less "coinage" than the stamp of the mint die on gold, silver, nickel or copper. In common acceptance, these paper issues are "money." So much so that they are freely paid and received everywhere as money. The banks themselves evidently regard them as money, or they would not have the effrontery to charge interest for a loan of their paper notes; even for a loan to the government itself!

None of these institutions is truly "national" or "Federal," being owned and operated by private individuals or groups of individuals, not as government agents, but for their own profit.

This is a fundamental mistake in the whole system. There should be no private banks. ALL banks should be owned and operated entirely and exclusively by the national government, as are the postal savings banks. Only so will it be possible to prevent the banks from being prostituted to the uses of gamblers and speculators, to the detriment of the producing classes. And with a truly *national* banking system, we shall have a truly national currency system—one from which the incubus of a gold basis will be forever removed, and with it the utterly fictitious pretext for the exaction of "interest" for the loan of money on good security for productive and constructive purposes. And loans should not be permitted for any other purposes.

Competing With Industry

THE New York bond market easily absorbed $100,000,000 Dominion of Canada five-per-cents recently, and on the same day over-subscribed a New York City offering of $45,000,000 at three-quarters of one per cent less, while the dispatches expressed the confidence of J. P. Morgan & Company that a large German loan would be floated in this country.

Home industrials are offering much higher returns for capital in an effort to re-establish business, while political wiseacres are seeking to delude the voters into a feeling that only by erecting high tariff walls can American manufacturing be conserved. The layman is thus confronted with a babel of ideas as to the needs of the country, while the international money kings continue skimming the cream from the milk of the productive cow.

How does it look to the reader to be told that we must bring order out of chaos, when the required medicine is being absorbed by public loans? Why are we told of the hopelessness of the German economic situation—at the same time being warned of the peril of a flood of German-made goods—when the wisest fox in Wall Street is willing to risk his own money in underwriting German finance? There is something very inconsistent in the financial dope served us daily which the experts cannot or will not explain.

Patriotism is urged on the American public, and the call has a ready response; but the appeal is too often made to distract attention from the operations of that class whose patriotism is a pretense, whose "only care is to increase their stock," at the expense of friend or foe alike.

Without Comment

ROBERT C. BENCHLEY, in *Life*, writes:

"It is an old complaint in these columns, but we really cannot pass up a chance to say a nasty word for the audience at the up-town presentation of 'The Hairy Ape.' We only wish that the Post Office Department would allow that word to be as nasty as we should like to make it.

"'The Hairy Ape' is a play which is full of talk such as one actually might hear in the stokehole of a steamer. It is spoken by a man whose spirit is being tortured in its attempt to break through the sweat and grime of his muscle-bound flesh into some sort of crude expression. It is the most tragic language we have ever heard.

"But because it takes the form of oaths, blasphemy and slang, many dear ladies (and, we must admit, a few men) took it for comedy and greeted each line with coy giggles. Several people brought children, thinking that it was to be something like Hagenbeck's Dog and Monkey Show. In front of us sat three of the fairest works of God, one of whom confided to the others, between nibbles at a chocolate: 'Of course it *is* morbid, but I see the humor of it.' And so she did, bless her heart! She would have seen the humor in the burning of Joan of Arc. But she will never know how near she came to having her skull crashed in. It all depended on whether or not I could get loose the arm of my chair to use as a club, and I couldn't quite make it."

On Leaving the Rhine

THE further delay in the return of the remaining American troops on the Rhine, while displeasing in one way, still carries the touch that flatters our pride.

Various reasons have been assigned for the delay, but there can be little question but that the reluctance of the inhabitants of the occupied territory to see Americans displaced by other troops was a factor. The Germans are naturally eager to have all the troops of the Allied and associated powers out of the country, but seem to prefer American occupation to that of other nations.

It is pleasant to feel that American troops prove the most agreeable and the least overbearing. There is no excuse from a military standpoint or under international law for continuance of American occupation under the terms of the armistice, but to know that Americans are able to adjust themselves to the proper terms of relationship under the Rhine conditions is an augury for continued peacefulness in our relations with other powers.

Some of our most resplendent diplomats have made sorry failures, but it seems that our private soldiers have been able to show a fine diplomacy wherever orders have sent them.

Saving a Billion

THE report of Charles I. Dawes, the budget director, showing that $907,400,000 could be claimed as a saving in the routine operation of government agencies, is pleasing in view of the great reduction in revenue which ensues from decreased private earnings throughout the country.

General Dawes has overcome many obstacles, not the least of which was the jealousy of Congress over the trimming of its appropriation function. In some instances, Congress has shown a tendency to override the budget bureau's recommendations. Much has been accomplished, however, and more commendable results may be expected if the budget bureau is permitted to cut a little more from the red tape which still binds bureau government closely.

The great proportion of the national budget which must be devoted to payment of past debts and interest on past debts has a tendency to minimize the public credit which should be due to economies in the cost of running the present government. The public for years to come must be reconciled to the payment of a vast percentage of their taxes in taking care of bonded indebtedness incurred by past administrations.

A Distinguished Diplomatist

THE increasing frequency of the recurrence of rumors of the recall of Jules Jusserand as the French ambassador to the United States must occasion regret in both countries.

In 20 years at the head of the French embassy at Washington, M. Jusserand has won high regard in this country. Although the emotional attention of the Americans was lavished chiefly on the personnel of the special French missions, Marshal Joffre, M. Viviani, and others, it is unquestionable that much of the French influence at Washington during the World War was due to the poise and sober counsel of M. Jusserand.

It is difficult for Americans to understand the apparent annoyance in France which is directed toward the envoy here. In a score of years he has represented acceptably governments headed by such diverse personalities as Clemenceau and Caillaux, Ribot and Briand, Poincaré and Viviani. French resentment toward him seems to be due to a belief that he should have foreseen and prevented the criticism in this country over France's attitude in the Armament Conference and in other recent international discussions. There is no doubt that M. Jusserand could and did foresee the unfavorable reaction which frank belligerency would create in this country; but that he could control the utterances of M. Briand or other spokesmen of imperialistic thought in France may well be doubted.

The foreign ambassadors, whose records in this country have merited strong commendation, have been too few. James Bryce from England, Wu Ting Fang from China, Jusserand from France—and that's about all of recent service. France, as was to be expected, officially denies that M. Jusserand's recall is under consideration. It is to be hoped that this official denial means more than usual, and that M. Jusserand will remain instead of becoming a scapegoat for others' mistakes.

Mr. Ford's Page

AS THE monetary affairs of the country are now shaped, it is possible for those in control of credit to relax their hold a little, let credit flow a trifle more freely, and so create a semblance of prosperity. This is a statement that scarcely needs demonstration, but if it did, a reference to machine-made "deflation" would suffice. "Deflation" is possible because of "inflation," both of which are not the action of "economic law" but the decision of certain human beings who are in control of the machinery by which these things are done. It may be a beneficent power when wisely used; it certainly is a dangerous power when ignorantly or selfishly used; but it is beyond doubt that it is far too important a power to intrust to any man or group of men, especially when such men are in a position to be benefited both by inflation and deflation.

We shall never live under the full guaranties of the Constitution of the United States as at present written, until such power is taken out of the hands of a group of men and placed where the Constitution places all monetary authority, namely, in the Congress of the United States.

It is impossible to imagine any Congress performing in full gaze of the country the strange and risky stunts which financiers have performed with the monetary system of this country. The excuse nowadays made for Congress delegating its authority to select groups of speculative bankers, is that individual Congressmen do not understand the problems of finance. That would be in their favor, for, not understanding, they would be incapable of doing many of the dangerous and hurtful things which men who do "understand" seem capable of doing. Furthermore, since the Constitution charges Congress with all responsibility for the country's financial system, it would seem to be wise for that body to take up the monetary question for itself, using as its textbook American life and business, instead of being dependent on the statements of men who are in the profitable business of keeping things as they now are.

The point, however, is here: If the artificial stoppage or release of the life-blood of commerce is in the hands of a few men, it is quite possible for them to loosen their hold a little if by doing so they can retain for a longer period the right to retain their hold.

That is, if an election is approaching, and bad business conditions prevail, it is possible for them to stimulate better business conditions if that will affect the election favorably for them.

It is not going back to the muckraking period to say that the political history of this country in the last 25 years offers several instances where the entire business of the United States was strongly and artificially manipulated for the purpose of affecting an election. In one election the money power quite plainly showed what it could do, and used the demonstration as a threat of what more it would do if the election went against it. The election went as desired, and the resulting administration was one of "prosperous times," for which a political party was given credit, although neither the political principles of the party, nor yet its administration of the government, had anything to do with the case.

Heretofore, the pressure of the money power has been largely toward depression as a warning. This time, however, there is ground for believing that the pressure is to be exerted the other way, for the stimulation of hope and satisfaction. If business can be made better during the summer and fall, by the loosening of credit, the campaign speakers can then attribute it to the genius for administration and to the prosperity-giving principles of the party in power.

It is a very effective device to keep the government of the country in the hands of certain groups no matter which party is in power. But there will not be many more opportunities of using it. It is a game, never more completely in the hands of its players than now, and never in such danger of being clearly understood and abolished by the people.

The chief danger is that the people will be deceived for a little while, and if they are, it will slightly delay the reformation. It will be delayed as long as the people can be deceived. And that throws a pathetic side light on the situation to which the plain people have been reduced. It has come to such a pass that, as in ancient Roman times, the people have been taught to believe that their bread is at the mercy of parties, a belief which is "proved" in our times by the manipulation of the strings which jerk business up or jerk it down. The time is coming when the people will learn that what they saw was only what they were permitted to see, and that behind the scenes were the things really worth seeing.

WHEN a puff of prosperity returns, for election or other reasons, see that it does not remove your minds from the economic problem which is never settled by any temporary prosperity. It is regrettable that people think about our monetary system, and of the other important parts of our economic structure, only in times of depression. In a situation so easily manipulated as ours is, it is comparatively easy to switch on a period of depression to force the people to turn a certain way, or to switch on a period of partial prosperity to take their minds away from too serious thoughts. It has been done, as every big politician and as every political banker knows, and it can be done again. But it is simply slavery to live under a system that can be thus manipulated. The only prosperity the people can afford to be satisfied with is the kind that lasts.

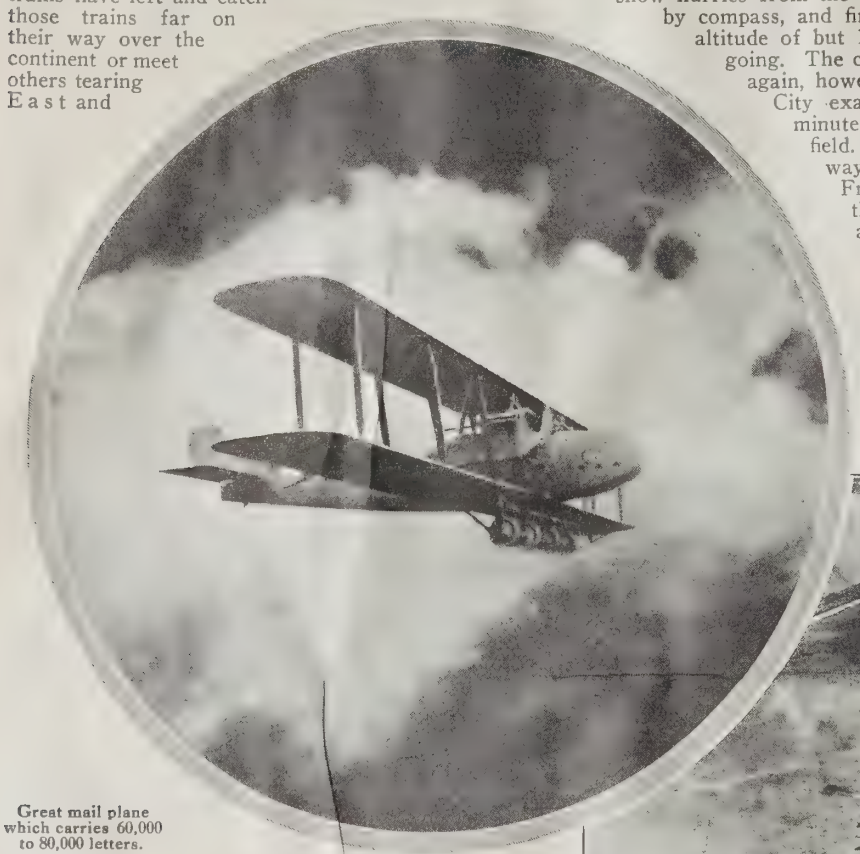
Instead of business "slowly improving" (the improvement being hastened a little in an election year) the United States should today be the happiest, busiest place in the world. It is the natural right of our people that they should be happy and busy. Everything necessary to that condition has been placed here in superb abundance. Instead of any party receiving credit for a condition in which a majority of the people happen to get enough bread to eat, no party should receive credit for anything less than a condition where everyone, down to the least, has the amplest opportunity for a completely furnished life. It is pitiful that people have become so beaten down as actually to thank a party for the chance to work!

Improvement will come (it being election year) but the people ought not to forget the main and continuing problems. It is to be regretted that we seldom think of economic questions except in times of depression. The time to think clearly and to examine our situation closely is in times of prosperity. The tendency of our leaders to use times of prosperity to turn our people into Romans at the games, boasting their temporary prosperity and might, heedless of the reaction which excess and artificiality bring, is a very dangerous one, and true leaders will endeavor to teach the people to be as serious and wise in their times of temporary prosperity as they are in times of depression.

There is no such thing as continuing prosperity under the present system which puts our Constitutional monetary authority into the hands of a few men whose whole life work is to make fortunes out of speculation in money. The people of this country may be just as sure of a return of "bad times" as of a return of winter, because wrong principles always operate that way. And the false prophets who always advise the people that prosperity is a matter of psychology, that if they "think" good times they will have good times, are successful mostly in turning the people's minds from the hard work of *thinking* on which reform depends. When the people begin to *think*, the manipulators and beneficiaries of the present system grow worried; it is then that they let the people in on some trifling benefit, to occupy their minds and drive out reflection on the system of things.

No one would advocate or wish a continuance of depression for the sake of having the people think seriously; but it would be desirable that the people apply their minds even in prosperous times to the means by which prosperity may become continuous and not merely occasional.

Letters Flying With Postmen of the Skies



Uncle Sam's Mail Crosses Continent in Quarter Time of Fast Trains

By J. OLIN HOWE

THE air mail flies on time. Neither fog nor storm prevents, and an occasional crash into a mountain top or forced landing in some far forest is but the fortune of the game. The ideal of the service is a schedule as regularly maintained as the human factor permits, without exposing its fliers to unnecessary risks, and this is realized to an exceptional degree by airmen whose morale and esprit de corps have never been excelled. A great railroad is just now pluming itself on a schedule performance of its passenger expresses running to 95.6 per cent. Through the latter months of 1921 the aerial mail attained an average performance of 98 per cent.

There was a month last summer when the intrepid pilots of the transcontinental mail planes flew their hundreds of thousands of letters across the land on schedule time to a percentage of 99.31. Hunters and punters on Lake Erie and forest rangers in the western Sierras set their watches by the air mail. While the 1919 tornado was finding its human victims by the score in Ohio and Illinois, the air mail flew through; and during the blizzard of 1920, when for days not a wheel turned between New York and Washington, the mail fliers were on their normal schedule.

An epic story is this of the service which is the last word in rapid transmission of the mails, whose planes daily wing their way into the blue, carrying crowded sacks of mail deposited long after the fastest trains have left and catch those trains far on their way over the continent or meet others tearing East and

Great mail plane which carries 60,000 to 80,000 letters.

rush the letters they bear to destination long before they could reach it. The flying mail has reduced by half the best time ever made across the country by rail and when in the near future night flying becomes the regular thing airplanes will speed our letters between the Atlantic and Pacific four times as rapidly as the utmost the railroads can do.

The cross-continent rail record, made by Harriman specials running with every element of delay, possible to be overcome, eliminated, is 72 hours, 27 minutes. Average time for the finest trains is 100 hours, somewhat more than four days. In actual flying time the air mail crosses now in 35 hours—letters mailed in New York are delivered in San Francisco in 50 hours—and soon it will take little more than a single day for first-class mail to go from ocean to ocean.

In a test flight, February 22 and 23, 1921, mail airmen flew in relays from San Francisco to New York in 25 hours, 21 minutes, of actual time spent in the air. A mail plane left Marina Field, San Francisco, at 4:50 a. m. on the twenty-second and the plane which bore its load dropped down on Curtiss Field, near Garden City, Long Island, the New York air mail terminus, at 4:30 p. m. the following day. An average speed of 104 miles an hour had been maintained across the continent.

This brings us to Jack Knight who arrived at the Omaha field at 1:15 a. m. on the night of the test flight with 16,000 letters which he had flown in from North Platte, Nebraska, 245 miles away. Bill Votaw, the field manager, met him, but said nothing then of what was on his mind. Bill was at his wit's end. The mail of the transcontinental test flight must go through and he was put to it for someone to take it. Harry Smith, who had brought it from Cheyenne, Wyoming, was at the field, but he had flown 458 miles between 7 and 11:30. His De Haviland-4 was the only plane available. Though flown nearly 500 miles that day, it was good for the 424 miles to Chicago. There was only Knight to depend on to fly it and Votaw let him get hot coffee and a bite at the lunch room before outlining the situation. He couldn't urge Knight to go.

The airman had done his day's work and, besides, was not wholly recovered from a crash of two weeks before on a mountainside near Laramie, Wyoming. Flying at 8,800 feet, Jack's motor had suddenly slowed down and quit and his only hope had been to land in a snow bank on the steep slope of the mountain. He was unconscious for an hour and a half and came to lying in a pool of blood in the snow. His nose was broken and he had many cuts on the face and a bad smash in the mouth. It took two hours of floundering in the snow and scrambling over rough mountain going for him to reach the nearest ranch house.

But Votaw must make good with Washington. The air mail appropriation was about to come up in Congress and its supporters needed this test flight. It might mean the life of the service.

"Sure I'll go," said Jack Knight. "Wire my wife." She was in Chicago.

He had never flown the Omaha-Chicago route, even in daylight. For 20 minutes he studied the map and then tore out a piece of it and was ready to start. At 1:59 the flier who had expected to be in bed left Omaha for Iowa City and Chicago.

It was not a nice night. He encountered fog and snow flurries from the outset and was obliged to fly by compass, and finally was forced down to an altitude of but 100 feet to see where he was going. The clouds thinned and he went up again, however, and at 4:45 he hit Iowa City exactly, but flew about for 12 minutes before locating the landing field. He was now 230 miles on his way and the worst was over. From Iowa City he flew through the dawn, with no mishaps, and came down at Maywood Field just after 7 o'clock. He had all but reached the field when his motor began to miss. "Just spit, old boy; we're here," he cried and volplaned.

As soon as it could be shifted to two waiting planes the mail he had brought was on its way to Cleveland and New York. The test flight of the air mail had gone through as planned, by grace of Jack Knight. "The Mail Must Fly!" the slogan of the service, had again been served. Knight waited for no laurel wreath, but was off to join his wife. Driving through with the mail on time is an everyday business with these boys. Aerial mail transport is already well standardized.

Training field for air mail pilots at College Park, Maryland.

That was what struck the president of one of our largest railroad systems who was being shown over the field at Bellefonte, Pennsylvania, where the mail planes soar down to be serviced midway between New York and Cleveland. This railroad man was much interested in the hangars and shops, but always his attention returned to the regularity with which the mail arrived and departed on schedule.

A reserve pilot was restlessly pacing up and down the field. Off duty and with an engagement in New York, he had missed his train. One of the great mail-carrying birds swooped down. Before it was ready to resume its flight the reserve flier had tied his suit case on one wing and himself on the other and he went on to New York with the mail.

"That's what we call deadheading," said the railroad president. "It speaks volumes for the air mail."

Many a story is told of the service—of flying between New York and Washington in pajamas, of reading and writing letters while in the air, of the pilot who once climbed out on a wing and repaired fabric torn by hailstones while in full flight—but one needs go no further than the pilots' reports for plenty of thrills.

Pilots Boggs and Page once lost their way approaching New York and wandered northward over the Catskill Mountains, where darkness and storm overtook them. They came rushing down over Monticello, New York, leaving a trail of sparks like a comet's tail, suddenly saw an open field in a lightning flash and landed in safety. With mail sacks as bedding, they spent the night in their plane.

In a dense fog, a pilot located Bellefonte Field by a mountain top which stuck up through and circled this for two hours and a half endeavoring to place himself for a landing. His gas finally exhausted, he was about to dive blindly when the mist cleared and he sailed down safely. The cockpit of his plane was littered with cigaret stubs.

Night flying is as yet voluntary, but not infrequently mail pilots have it thrust upon them as a hazard of the service. Eddie Hubbard often comes home to Seattle after dark, using intermittent flashes from a huge chimney on the water front as his mark. Hubbard has the most valuable seaplane contract in the world, one of the two private contracts for flying mail which have been let by Uncle Sam's Post Office Department. The other covers the flying boats which carry United States mail between Florida and Cuba in an hour, where steamers take half a day.

Hubbard is a former army flier who advances mails to and from the Orient, always by many hours and sometimes by weeks. Steamers westbound leave Seattle at 9 a. m. and often miss the incoming connection from the East. Hubbard leaves at 1:30 p. m. and catches the steamer at Victoria, B. C. Incoming steamers may stop at Vancouver after leaving Victoria for Seattle and always are held up long hours at quarantine at Port Townsend. Postal officials are notified when they will reach Victoria and have Eddie Hubbard on hand to hurry their first-class mail to Seattle.

Hubbard averages 111,000 letters and 1,500 miles a month. His contract calls for not to exceed 10 round trips a month at $200 each. In the year ending October 15, 1921, he made 103.

Without scheduled night flights, the transcontinental air mail, all Uncle Sam has left just now of mail-carrying by air on his own account, does not fly continuously from coast to coast. Indeed, swift planes and fast expresses co-operate, and interchanges of mail take place wherever time can be saved. The 15 stations on the air route between New York and San Francisco, a flying distance of 2,680 miles, are organized in seven sections and three divisions. Pilots fly back and forth within their own sections and learn their territory thoroughly. New York is headquarters for the eastern division, Omaha for the midland and San Francisco for the western.

The first hop out of New York is to Bellefonte and then on to the section terminus at Cleveland. By air it is 435 miles from New York to Cleveland, about two-thirds of the rail distance, and this is flown in six hours where rail expresses take from 13 to 17. Leaving New York

Seattle postmaster wishing Eddie Hubbard bon voyage.

at 7:30 a. m., by winter schedule, the mail plane takes what the last through train of the evening before could not (the bulk of New York's mail is deposited after 4 p. m.) and what comes in through the night and advances it 12 hours by transfer at Cleveland to a train which makes the same western connection at Chicago as the other train.

Cleveland-Chicago is the second transcontinental section going West. Air mail leaves Cleveland at 8:40 a. m., Chicago city mail taken off a New York train which would not reach Chicago till 4 p. m., and reaches Chicago by 12:15, in time for afternoon delivery. This advances delivery perhaps 18 hours.

The western mail plane leaves Chicago each morning at 6:30 and is sped to Omaha, with service stop at Iowa City, and there transferred to a waiting plane and at North Platte, Nebraska, catches a San Francisco train which left Chicago the mid-afternoon before. North Platte to Rock Springs, Wyoming, with intermediate stops at Cheyenne and Rawlins, is the first section of the western division, and at Rock Springs mail is taken off an Omaha and Ogden train which reaches Salt Lake at 2:30 p. m. and this reaches the latter city at 9 a. m. instead. The extreme western section is from Salt Lake to San Francisco, with Elko and Reno service stops.

Eastbound mail from San Francisco is advanced a full day by a two-hour flight to Reno to catch the through train which takes 10 hours to make Reno through the mountains. Again at Reno eastbound mail leaving the coast at 6 p. m. is taken from the train and flown to Salt Lake to catch a train which left San Francisco hours earlier, thus expediting it 24 hours. A similar shift at Cheyenne accomplishes a like result.

The point that this transcontinental service is all the aerial mail Uncle Sam has left should be stressed. Always the air mail has operated on a shoestring, on the reluctant dollar wrung from a Congress which delights to appropriate millions for elegant post offices, in prairie hamlets. Congress disregards all else and refuses to establish air mail routes where the cost is greater than that of rail transport. Even this handicap is being overcome by standardization and increasing efficiency.

It costs less than two cents apiece now to send letters by air. Taking into account the early experimental period, when the air mail was regarded purely as a special service and 25 cents an ounce was the rate, the average cost per letter carried in its three and a half years up to last fall was hardly over two and one-half cents. Moreover, the air mail saves 80 per cent of its cost through the elimination of railway mail cars and clerk hire it makes possible.

The air mail was born May 15, 1918, when one of six pilots detailed by the Army Air Service flew from New York to Washington in two hours with 5,000 letters. The service thus inaugurated was an instant success, despite innumerable difficulties. It advanced New England mails for Washington and southern mails for New York greatly. The Post Office Department took over the service in August, 1918. The first anniversary brought a Cleveland-Chicago service and July 1, 1919, a Cleveland-New York service linked New York and Chicago and expedited mail in either direction 16 hours. On December 3, 1920, Pilot Christensen flew 16,000 letters between the two cities in 5 hours, 31 minutes, hardly more than a quarter of the best rail time.

The air mail's second anniversary saw the beginning of a Chicago-Omaha service and on September 10, 1920, mail first crossed the continent by air. The same year services between Chicago and St. Louis and Chicago and Minneapolis were started, but those and the New York-Washington service went by the board and several expensive flying fields were abandoned at the close of the fiscal year in 1921 because Congress refused funds for their maintenance.

Yet the total cost of our air mail up to September 30, 1921, was but $2,539,457.60. It now costs about $1,500,000 annually to operate the transcontinental service, which daily flies 225,000 letters and over 5,000 miles. Up to September 30, the respectable total of 2,205,869 pounds of first-class mail had been carried by air in this country. This averages 40 letters to the pound and the usual airplane load at present is 400 pounds—except in western mountain districts, where 300 is the limit.

In the three years, four and a half months referred to, mail pilots flew 3,081,648 miles, which included 355,136 miles testing, ferrying, and so on, at a grand average speed of 84 miles an hour, two and one-half miles to a gallon of gasoline. They flew 36,215 hours with mail at a minimum speed of 80 miles an hour, and often doubled that, at a cost of $70.12 an hour. One-third of all their trips were made in fog or storm and they made a total percentage of performance for this more than three and a third years of 88.82.

There were 97 crashes in which the plane was destroyed in that time and 23 fatalities. Of the latter, 18 victims were pilots. One was a division superintendent and one a civilian employe out for a joy ride.

On November 16 last the air mail had 44 pilots and a total personnel of 481—mechanics, riggers, helpers, clerks, chauffeurs, radio operators, and so on. This did not include the general superintendent and his assistant or the second assistant postmaster-general, under whose direction the service comes. The pilots are nearly all ex-army fliers. There have been thousands of applications, but only a small percentage ever even get to the air mail training field at College Park, Maryland. They must first be thoroughly trained airmen. Pilots are paid $2,000 a year and five cents a mile flown, which totals from $3,000 to $6,000.

The service has some 50 planes in constant use and three times that number in reserve. Remodeled military equipment, they are, almost entirely. The Curtiss JN-4D which made the first mail flight between New York and Washington is still in use and has flown a total of miles equal to three times around the earth. A couple of years ago a number of larger and sturdier machines, adaptations of the big Martin bomber, were placed in operation. These carried two pilots and from 1,500 to 2,000 pounds of mail successfully through the roughest weather and they worked no small economy, though existing landing facilities were hardly adapted to their use. None is flying now. All have crashed.

The department is beginning now to use remodeled De Haviland planes in which one pilot can fly twice the weight of mail, 800 pounds, and which cost but $3,000 each to alter as against five times that for new planes. This is the latest type of small plane, with a speed of 115 miles an hour. Last autumn six were placed on the western end of the cross-continent route and eventually the capacity of the air mail will be doubled by their exclusive use.

Night flying will be the next step and mail will go straight through by air. That means radio—radio telephony rather than telegraphy, the radio compass or direction finder and the field localizer. Already the 15 air mail fields, that at College Park and the Department at Washington, are equipped with wireless and 27 operators are on the job. Administrative messages pass back and forth through the atmosphere, and the news of airplane movements and the weather reports.

On a big map in the Post Office Department are tagged every hour the positions of all active pilots and planes in the service. Washington is ever in touch with each station across the land and every scrap of useful information is quickly passed along.

All fields are being developed to make night flying not only feasible but reasonably safe. Beacons will guide pilots between stations and each field will have its telltale mark outlined in brilliant lights. Mails will start from either coast at daybreak and night flights will be over the center of the country.

From the moment they leave the home field pilots will be in telephonic communication with the ground and can be informed and directed with perfect ease. The marvelous radio receiver and transmitter developed during the war tune out the roar of the motor, the rush of the wind and all other noises, leaving only the tones of the voice which ride the wireless wave. And always the pilot can depend on the wireless compass to keep him headed straight, regardless of weather conditions, and as he nears his destination the radio localizer not only tells him when he is over the center of the landing field but records each change in altitude as he drops toward it.

Just at present Congress is in a penurious mood, eager to save the actual visible dollars of today's taxation, without regard to whether that saving is the most costly of extravagances. Everyone hopes that there will be no more wars, but if war should come, the air unquestionably will be a field of great if not greatest activity. Toward the close of the World War, aviation played a great part.

The scrapping of navies has accentuated the possibilities of the air in war-time. So, purely from the standpoint of attaining the greatest possibilities from air service in war, the continuance of its development in peace-time is economy.

The possibilities of the air for transportation purposes have only been touched at the rim. It is a field in which immense development can be expected. But the initial cost can only be borne successfully by the government. The experimental period of an industry which may easily contribute much to the commercial standing of the country is one which the government should guide.

Even were there no commercial returns to be expected, it is doubtful if serious objection would be made to national appropriations for air service development. But with the perfectly legitimate expediting of the postal service to be considered, there comes the added reason of desired and desirable public service to justify the expenditures necessary for the development of aviation.

The postal flyers are writing a page of romance in the marvelous history of American industrial development. They are truly knights of air, hazarding life and limb in a new cause. Speed is the thing today and speed in mail service is best attained through the medium of the air.

An infant public industry, the postal air service has developed far beyond the strongest predictions of its advocates. It spans the continent. It keeps up its schedule. It overcomes weather obstacles which daunt transportation agencies on the solid ground. It is no longer a theory, but as practical a fact as the sewing machine. It should stay.

A Horse Lifts Racing From Its Depths

Morvich So Great That Corruption in Sport Fades When He Runs

IN THE loneliness of immense superiority, a mighty but homely horse circled the famous race course at Churchill Downs in Louisville—and all the country looked on.

Ten thoroughbreds in whose veins flowed the bluest blood in all the fine Aristocracy of the Horse paraded before 70,000 persons who had come from coast to coast to witness the forty-eighth running of the Kentucky Derby, May 13.

But among those 70,000 and among the millions who waited expectantly throughout the country, there were few eyes for the handsome and proud-appearing creatures. There were eyes only for Morvich.

For three minutes at the starting post, the horses pawed and backed and jostled, before the barrier was sprung. All eyes were centered on the third horse from the rail, astride of which crouched a little jade and orange attired jockey. This horse broke second and with two leaps was first.

Then for one and one-quarter miles, Morvich all alone ran his royal way to fame that shall last as long as horses are remembered. There were others who challenged. One stable, bearing the hopes of those whose pride is in Kentucky, the home of the thoroughbred, sent three horses to battle with Morvich for supremacy. One was told off to the duty of driving the favorite to speed so that the others might triumph when the wonder horse had been burned out by the killing pace. But the challenger must pay for life the price of his sacrifice. He broke down and from a most valuable animal will be utterly useless. And Morvich, undisturbed, ran his race.

In the parlance of the race track, Morvich, unbeaten son of Runnymede by Hymir, made every post a winning post, and won easily, going away. His time on a bullet-fast track was 2:04 3-5, a record beaten but thrice in the Kentucky Derby. And he won unextended. He did what his sire failed to do.

But this is not a story of Morvich, the cast-off, who became the greatest horse of the year on the American turf beginning his three-year-old career with his twelfth victory without a defeat. Rather it is of Morvich, a horse too great for human guile to destroy.

There have been great horses before, horses which have run in faster time, finished with courage as great, and endurance as unalloyed. But Morvich's glory lies in the fact that he has been able briefly to restore to American turf a sportmanship lost, and to lift horse racing for a brief 2:04 3-5 minutes of actual run ning from the lowest mire to which gamblers, ex ploiters and doers of scandalous things, have sunk it for these many years. Horse racing has become anathema to the solid citizenry of this country. It has become a sort of a disgrace to attend a race meet ing or to show knowledge of horses. The by-products of the sport are unlawful, and it is with the whisper of the bootlegger and the nervous fear of the dweller of the underworld that one speaks of what once was the sport of kings.

The coming of money to the game of horseman ship was its ruin. Races are theoretically run for purses sufficient to pay the expenses of operating the stables. Too often they are for the "wise gamblers" who have corrupted owners and jockeys that they make money on a sure thing.

It is the horse's skill, speed and endurance, plus a little of human training, that is the thing. But the nature of things makes it the man who takes the profit.

Morvich in the last few months has become a name to conjure by. In places where race horses are never spoken of, he became the subject of intent interest. He was a wonder horse. He had been too great for the vast returns which a "fixed race" would have permitted the gamblers to reap.

Dean Swift somewhere wrote of a race of horses vastly superior to humans in intelligence, in honesty and in other of the virtues.

The intelligence and honesty are granted, but it is seldom that there comes a Morvich or a Man of War, whose marvelous physical prowess is so outstanding that human dishonesty may not destroy it.

But Morvich seems to fill the bill. So far at least he has sufficed to lift the sport of horse racing from the depths.

American racing history is one long record of tragedy, marked here and there by the emergence of some horse of such surpassing excellence that he has risen superior to the human elements which are determined to make merit bow the knee to money.

When such a horse appears, gambling dies of pure inanition. Two years ago it was Man of War whose wonderful speed and honesty stopped race-track gambling which all the laws and enforcement officers of New York State had been unable to check. Man of War finished first in 20 out of 21 starts; bookmakers refused to quote prices on him in a race in which he was entered. The vast crowds which came to see him run were proof that the American public enjoyed the sport of racing with betting barred. There have been a few rare instances previously which compare with that of Man of War. Domino, with 19 firsts out of 25 starts, and Sysonsby which finished first 14 out of 15 times, are the most notable.

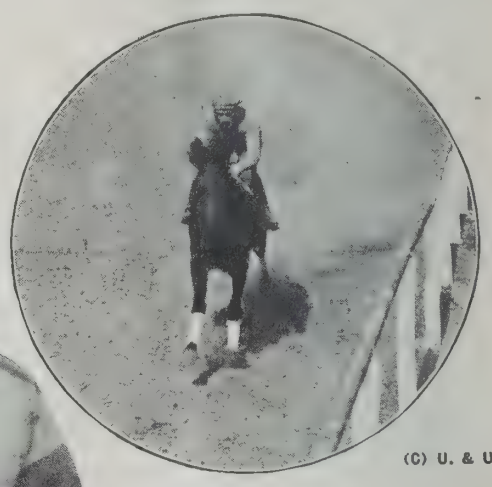
Governor Nicholls of New York is credited with inaugurating racing in this country in 1665. The nature of things prevented much development until the last century, when it received a tremendous impetus especially in the South. After the Civil War the pastime gained in supporters, but also in the factors which subsequently brought it into vast disrepute. It is useless here to set forth the steps whereby the sport of kings passed into the hands of the exploiter, the alien, and that indescribable gentry who dwell in the no-man's land between "smartness" and actual crookedness. It is sufficient to remember that this transfer, little understood though it was to the general public, culminated in the widespread agitation which brought such legislation as that sponsored by Governor Charles E. Hughes in New York, and left racing with a name which it may never live down.

There are a few wealthy sportsmen and a few real horse-lovers among trainers and owners who have sought to retain racing as a sport, and there are a few great stake races, like the Preakness in Maryland, the Metropolitan, Brooklyn and Suburban Handicaps in New York, and the Kentucky and Latonia Derbies in Kentucky where merit still holds sway.

But above events and men there comes at rare intervals something greater than either in arousing moral qualities, long dormant and stirring impulses long forgotten—a great horse, like Man of War or Morvich.

Horse racing got its origin far back in antiquity. Thothmes I of the Eighteenth Dynasty in Egypt raced horses. King Solomon paid many talents for horses he bought in Egypt. Racing was popular among the Greeks and as far back as the Thirty-third Olympiad in 648 B. C. it was a recognized part of the Olympian Games.

Records show that horses were raced by the Britons and later by their conquerors, the Saxons. In the reign of James I and under the succeeding Stuarts, horse racing blossomed. There had been racing under Queen Elizabeth, but under James I the sport was legally established. Racing in the seventeenth century was by no means confined to the gayboy and the cavalier. It was a sport suitable even for the most somber Puritan. Oliver Cromwell bred and kept race horses. The attention given to horse-breeding during the seventeenth and eighteenth centuries caused the importation of aristocratic animals into England, and their combination with the native stock.



Names to conjure by in horsedom were those eighteenth century animals to whom the blood of the proudest thoroughbreds of today is traced. There was the Helmsley Turk, the Byerly Turk, D'Arcy's White Turk, the Darley Arab, Dodsworth and Greyhound, and others scarcely less distinguished.

The great-grandson of the Darley Arab, Eclipse, born in 1764, is credited with having been the foundation horse of the turf. In many of the finest American thoroughbreds, which have won the great handicaps in this country, the blood of the Darley Arab has flown. Messenger, a colt, whose sire was Blais, and whose dam was Turf, a descendant of the Godolphin Arab, was imported by an American breeder. Blais was a son of Flying Childers, the best-known colt of Eclipse.

There is considerable buncombe about the purity of the strains of bloods in horse records, and there is no doubt that early breeders stretched their imagination to bolster up the pedigrees of their animals. But the record during the last century has been fairly clear.

English racing under the Stuarts resulted in the inauguration of the famous stakes, the Cambridgeshire, the Cesarewitch, the 1000-guineas and the 2000-guineas, on the celebrated course at Newmarket. There are other famous courses, notably Ascot, the rendezvous of the aristocracy and the fashionable, but in all England there is no race more famous than the Derby.

"The Darby," run annually at Epsom, just outside London, is the event of the year. The Derby, named after the twelfth Earl of Derby, was inaugurated in 1730. English racing has not yet succumbed so completely to the baneful influence of the elements who have ruined horse racing as a general sport in America. There is much betting in England, but it is of a different type than the American race track now knows —a betting more on the order of the sportsmen's true blue backing of their favorite horses, than of the cold, slimy "sure-thing" bets of elements who seek vast returns overnight because they are "in the know" of "fixed races" and "pulled horses."

These three views of the wonder horse, Morvich, reveals what a splendid animal the son of Runnymede is.

Brokers' Frauds Costlier Than Crime Wave

People Robbed of More Money in Wall Street Than by Master Thugs

By CHARLES ALBERT COLLMAN

WILL the world lose confidence in Wall Street as a financial center, unless it reforms its methods of handling the public's money? Joab H. Banton, district attorney of New York, believes that, at the present moment, the financial district is being weighed in the balances, and that if found wanting, New York will lose its position of monetary supremacy. He is convinced that the licensing of brokers, and putting them under the supervision of the state banking department, or some special public officer, would protect the people and take away the subterfuge of the dishonest. The peculiarity of existing laws, which hampers the prosecution of dishonest brokers, will be described in Mr. Banton's own words.

By some remarkable error of human judgment, the district attorney is opposed in his efforts by the very men whom such a law would benefit. The opposition comes from that powerful aggregation known as the New York Stock Exchange—a group of banking and commission houses, allied in what is known as a "voluntary association." The brokers refuse to be under anybody's supervision, ignoring the fact that if they would submit to be licensed, the hordes of scamps who infest Wall Street, where they are known as "bucketeers," would be wiped out of business.

More than fifty brokerage concerns have failed in Wall Street during the last few months, the greater number of which were bucket shops. In some instances the receivers found assets of only two per cent of liabilities, indicating that the money of customers had been dissipated as it came in. Many of these firms were in the ghoulish business of following up the obituary and probate court notices in daily newspapers, duping the heirs of deceased persons with alleged "investment opportunities."

Working the "Sucker Lists"

ANOTHER business device was working so-called "sucker lists," which has been developed to a fine art in Wall Street. Clerks in corporation offices are bribed to copy from the transfer books the names and addresses of men and women who have invested in industrial, mining and oil stocks. Certain firms, engaged in this traffic, sell their lists of investors to brokers. The latter install large numbers of telephones in their offices, and persuasive salesmen call up the prospective victims. Stocks thus sold are usually worthless. The extent of stock-selling by telephone may be imagined from the fact that one bankrupt bucket shop, on the day of its failure, was found to have "stung" the New York Telephone Company to the tune of *$20,000 for telephone calls.*

Through the failure of one large house, 8,000 men and women, from every walk of life, teachers, janitors, widows, and veterans of the Civil as well as the World War, were rendered financially destitute. Supposedly reputable membership brokers had accepted huge sums in commissions from bucket shops for unexecuted transactions, which were intended to manufacture false bookkeeping records to protect the "bucketeers." One of the commonest forms of fraud perpetrated was to neglect to deliver to customers the stocks they had purchased.

So tremendous was the amount of money shown to have been stolen, that Mr. Banton was aroused. He went to Albany, and before the legislature sponsored the Katlin bill, which provided for the licensing and regulation of stockbrokers. This measure, which would have put an end to, or at least have curbed such gigantic swindles, was immediately opposed by Seymour L. Cromwell, president of the Stock Exchange. Thereupon 26 state senators voted to recommit the bill to the committee on banks, thus defeating the proposed legislation.

Stung to anger by this defeat, the district attorney at once issued this announcement: "Wall Street must be regulated. I am going to preach that doctrine in season and out of season. I am going to take the stump against the men who voted to bury the Katlin bill, and I expect that some of them will be missing from their seats in the legislature next fall."

Now Know He Means Business

SUBSEQUENT events showed the Stock Exchange interests that they had made a grievous error in opposing the Blue Sky laws. Today they have come to realize that the district attorney means business.

Mr. Banton is a Texan, but is a descendant of a family which, in the early years of our country, migrated from New York, some of its members going to Maine, quite a number settling in Central New York, while others went to Virginia. Mr. Banton springs from the southern branch. His father was judge of the Waco district court at the time of his death in 1873. Young Banton had an uphill climb after his father's death. He began work as a newsboy at the age of nine. A few months later he had a job as cash boy in a dry goods store, and it was not until he was 16 years old that he had an opportunity to attend school. When he entered college in 1887, he had money enough to sustain him for just three years, and he crowded the full collegiate course of four years into three years. In 1890 he was graduated as valedictorian of the class from Transylvania College, Lexington, Kentucky. Admitted to the bar in Texas, he later took a postgraduate course in law at the University of Virginia, and moved to New York in 1896. He has been a leading member of the New York bar for nearly 25 years.

After the shelving of the Katlin bill, and facing the hostility of a large financial group, the district attorney nevertheless began a vigorous prosecution of dishonest brokers in the Wall Street district, which early came to be known as "The Bucket Shop Inquiry." Complaints of the abuses and frauds practiced by Wall Street concerns poured in upon the district attorney's office from every part of the United States, from Canada, Mexico and the West Indies.

What especially awakened the indignation of Mr. Banton, was the boldness with which many of the accused brokers evaded the examination of their books. One of them even instructed an office boy to throw his books and accounts overboard into East River from a Hamilton ferryboat. Police boats were set to work to drag the bottom of the river in the attempt to recover the documents. Still the sentiment in the financial district was against the provision to compel brokers to show their books on demand or lose their license to do business. But Mr. Banton holds that no effective control can be exercised over the brokerage business

JOAB H. BANTON

while suspected brokers are at liberty to refuse the district attorney or the grand jury the right to inspect their accounts.

Made uneasy by the continued exposures of further wrongdoing, and the effect they were having on public sentiment, a conference was held in the governors' room of the Stock Exchange by Exchange members and their partners. A reform plan of his own devising was outlined by the president, Mr. Cromwell, who, in addressing the members, said: "The governors of the New York Stock Exchange are now about to put into effect a plan for closer supervision by the Exchange itself, of the business methods of its members. In addition, the Exchange will require from its members doing a margin business, at periods as frequent as twice a year, the answering of a questionnaire which will cover all the points necessary to disclose their condition.

Won't Eliminate "Bucketing"

"RIGHT here I have another appeal to make: Won't you help to stop the soliciting of business over the telephone? *We know that the non-member houses have lists of people of means whom they continually solicit in this way. We know that they scrutinize the obituary lists and pursue the heirs of estates. Let us declare openly against these practices."*

The speaker failed to acknowledge the fact that whatever reforms may be instituted by the Stock Exchange, they will not succeed in eliminating the bucket shop evil from Wall Street.

Mr. Cromwell in opposing the Blue Sky bill says: "This bill might catch a few crooks but it would restrict legitimate trading in a way that would do incalculable harm."

The president of the Stock Exchange contends that bucket shop offenses are plain larceny and that there are existing laws which may be endorsed against them. He reasons that the licensing of brokers will do more harm than good, since crooked operators might get licenses and get a chance to operate under the sanctity of the seal of the state. He is opposed to supervision or regulation of the Stock Exchange by any state authority, arguing that then if the Exchange disciplined a dishonest broker the latter could go to the courts and get an injunction which he cannot do as the Exchange is constituted at present. It is a voluntary corporation. An Exchange seat today sells at $95,000.

"Mr. Cromwell is absolutely blind," said Mr. Barton. "The best interests in Wall Street, men who represent the investment business, and are not identified with brokerage or speculative operations, have assured me that I am exactly on the right track. It is only the selfish members of the New York Stock Exchange who are opposed to the proposed licensing of brokers. Let them discipline their members as much as they wish, but they have no authority to get into my way in disciplining them under the law. But I do not believe it should be so constituted as to be above the law.

"Prevent, Don't Prosecute"

"ISN'T it better to prevent, rather than to prosecute? Honest men have no objection to having their business under the supervision of the government or state. When they attempted to regulate banks, it was said that regulation would hamper business and cause banks to fail. I believe it was A. Barton Hepburn who was made the first banking superintendent in New York. His initial investigation revealed to a certain bank that systematic larceny was being practiced by a number of clerks. His discovery checked an enormous loss to the bank. It was then realized that supervision was a good thing, and the banking interests ceased their opposition. There is not a person in the country who would now be willing to revert to the old haphazard conditions which previously existed.

"The legislation that we propose is twofold. It is adapted to reach the common stealing that is perpetrated by two methods. One is the selling of slips of paper which are called stocks, but which represent no monetary value. To prevent this is the purpose of the Blue Sky laws as one finds them in the West.

"As we represent the center of the brokerage business of the country, we are trying to go further to check another class of stealing called 'bucketing.' If I use my knowledge of the brokerage trade against the business you give me, I am just as much of a crook as the real estate broker who tells you that a lot can't be sold for more than $15,000, when he knows that it can bring $21,000. If I create a market above or below your order by a fictitious lot of trading, I'm stealing not only from you, but defrauding the whole community. Wash sales are common, ordinary stealing.

U. S. Bonds for Wildcat Stuff

"AT LEAST $750,000,000 has been wrongfully taken from the pockets of the people who have invested since the war. The man who has saved and invested in Liberty bonds, has been persuaded to exchange them for mere scraps of paper.

"This is a question of stopping a thief rather than putting him in jail. We should regulate brokers by licensing them, just as we have licensed savings banks and insurance companies, and placing them under supervisory control. When you put a deposit in a bank, you don't have to lie awake nights, speculating whether the bank is solvent, or whether you are apt to go broke. Why not place the brokerage business on the same splendid foundations?

"Here is what happened in an actual case. Dier & Company failed for $5,000,000 and over. Dier & Company today have less than $100,000 assets. Can you imagine any bank frittering away its capital, surplus and deposits, so that it would have less than two per cent? We issued a subpoena for the books. The firm sought to restrain the district attorney. Judge Hand denied their motion, on the ground that delivery of the books by bankrupts to a receiver operated as a waiver. Dier & Company have now taken an appeal to the Supreme Court of the United States. It is next to impossible to prove that a crime has been committed by any member of a brokerage firm, or any one connected with them, without an examination of such books. This shows the absolute necessity of having laws in this state which will put brokers under the control of the banking department or some like department, and place their records at the disposal of public officers.

"The district attorney has also been restrained temporarily from examining the books of Ruskay & Company. Now if a bank or insurance company fails, this does not exempt them, because courts have held that when one applies for a license to do business he waives his constitutional privilege, and opens his books.

"I am trying to put those bills through, but find myself opposed by fellows who, in the last six months, have taken $100,000,000 away from the people in New York. This situation affects the financial supremacy of New York. The so-called crime wave is nothing to the brokerage frauds. We can handle thugs, and are doing so. But when the confidence of the world in New York as a financial center is lost, then New York will surely suffer. So I find myself fighting for the metropolis, and for its financial supremacy, its honesty and integrity."

Conservation of California's Wild Flowers

Five Thousand Beautiful Blossoms Driven to Mountain Fastnesses by Man

By HARRY H. DUNN

ACTION will be taken at the next session of the state legislature to place the wild flowers of California under the protection of the law, just as the wild mammal and bird life and the fish of the state are conserved and protected by the California State Fish and Game Commission. This movement to save the wild flowers was called forth by the danger of the early extermination of the California poppy, the state flower; the Matilija poppy, and other popular wild flowers. It follows continuous work for more than 10 years by one woman and her son.

There are some 5,000 varieties of wild flowers in California, as compared with about 3,000 on the Atlantic coast, and the Mississippi valley. These, except for a few varieties which have been domesticated, have been driven far back into the hills and the mountain meadows, by the incursions of the motorists, the campers and the hikers. The harm is not that people pick these flowers, but that, in picking them, they pluck out plant and root, thereby destroying entire fields of California poppies, platystemons, Mariposa tulips, bluebells, and other flowering plants, once so plentiful that the early Spaniards called California the "cloth of flowers." California poppies which once covered the rolling foothills of Southern California are found now only in the secluded valleys of the higher hills, or in gardens, where they have been developed out of all resemblance to the dainty wild blossoms.

In the campaign for this protection of the helpless wild flowers, an exhibition was given in San Francisco, April 20, 21 and 22, under the auspices of the Wild Flower Conservation League, a national organization, and under the immediate direction of Mrs. Bertha M. Rice and her son, Roland Rice, of Saratoga, California. More than a decade ago, Mrs. Rice began her work for the wild flowers of California, and, with her son, succeeded in enlisting the aid of such men as David Starr Jordan, president emeritus of Stanford University; Dr. Benjamin Ide Wheeler, president emeritus of the University of California; Luther Burbank; John Burroughs; the then governor, Hiram W. Johnson; Dr. H. C. Bryant, of the faculty of the University of California; Dr. Aurelia Henry Reinhardt, president of Mills College; Dr. William Frederic Bade, president of the Sierra Club; and others prominent in public life.

The exhibition this year was remarkable. It presented more than 1,000 varieties of living wild plants, in full blossom in surroundings like those in which they grew. Soil for each of these plants was brought from its own habitat. Plants from the desert were grouped together, more than a score of different varieties of cactus being shown, along with the flowering mesquite, and a large number of the flowers which clothe the desert for a brief period in springtime. Trilliums, growing in their natural places at the bases of redwood saplings, vied with Leopard lilies from the high mountain meadows, and with the yellow Calochortus, kindred to the Mariposa tulip, but which grows only on the slopes of Mount Diablo, while the Mariposa, in its many species, flowers all over California from Shasta to San Diego and from the coastal mountain wall to the sea.

Some seven hundred persons from every county in California sent flowering plants, with quantities of the surrounding earth. The Wild Flower Conservation League estimated the attendance at 20,000, of whom between 6,500 and 7,000 were children of school age. The 1922 show was the eighth given. Mrs. Rice is also the sponsor for Wild Flower Day, April 24, which was inaugurated by Governor Johnson in 1915.

A special effort is being made to reach the children, both through the annual exhibits and through the educational work during the school year. "If the children can be taught the beauty and the value of the wild flowers, and their place in life, the coming generation will not wantonly destroy them," said Mrs. Rice. "In the passage of legislation aimed to protect the wild flowers, no attempt will be made to prohibit the picking of the blossoms, but a check will be put on the tearing up of the entire plant and its destruction."

A large number of curious and interesting stories have been collected to be told to the children in the schools and at the living wild flower exhibit. For several years the nature guide service in the Yosemite National Park, maintained jointly by the Federal Department of National Parks and the State of California, attracted 60,000 persons who heard lectures, camp-fire talks and took field trips. Approximately 27,000 of these visitors were children. So great was the demand for more field trips on the part of the children that the facilities for the service in 1922 have been doubled, with the approval of Stephen T. Mather, director of national parks for the United States Government.

The same plan, in modified form, is being used by the Wild Flower Conservation League, in the hope that the training of children will bring them to a maturer age with an understanding of wild flowers and a desire to protect them. The mysterious snow flower of the high Sierras, and especially of the Yosemite Valley section, is now protected by law, as is also the *tollon* berry, which ripens to flaming crimson clusters about the time of the Christmas holidays, and which had been all but exterminated by careless pickers, who broke down the trees and left them to die in their haste to gather the berries. It is probable that, within the next year, all the wild flowers of California will be protected.

Oddly enough, few of the California wild flowers have been domesticated in this country, though the home gardens of England and of continental Europe are full of them. The domesticated wild flower, after a few generations, loses much of its pristine appearance, and, by exaggerated size and development of certain parts at the expense of others, becomes almost a different variety of blossom. Thus, the wild flowers cannot be preserved in ordinary gardens; they must be safeguarded where nature sowed them. Today, they are nearly gone from the highways of California, which once were bordered with a myriad-hued carpet of beauty. From the end of March to the end of September, the flaming beauty of such midsummer blossoms as the Indian Paint Brush, the Cone Flower and the wild sunflowers made the roadways brilliant.

The exhibit of the thousand varieties of wild flowers attracted almost as much attention as the famous annual dahlia show in Oakland, or the chrysanthemum show of San Francisco; indeed, it probably accomplished more from an educational standpoint than either of the two exhibits of domesticated flowers, beautiful as they were. Among the rare and seldom-seen wild flowers exhibited was the yellow Calochortus, which, according to Mrs. Rice and other botanists, is to be found only on the slopes of Mount Diablo. Of this flower, Mrs. Rice says:

"This yellow tulip is a close relative of the Mariposa 'lily,' which is in reality a tulip, and, which, because the beautifully-marked blossoms are held on slender stems, swaying high over the grasses, was named 'Mariposa'—butterfly — by the Spaniards, the first white men to see it. It even reaches to the desert, where the flaming, vermilion, tulip-shaped Desert Mariposa is a delight to motorists along the desert roads. The flower is a reproach to the phrase 'God-forsaken,' as applied to the desert. There are scores of varieties of these Calochortus, one of them, commonly called the 'Sego Lily,' is the state flower of Utah, where it is esteemed not only for its beauty, but also because its edible corms formed a substantial part of the food supply of the Mormon pioneers when they crossed the desert. This flower was named by the Ute Indians, and is often called 'Sago,' but 'Sego' is the correct Indian word. The Utes consumed great quantities of the corms, and named them 'noonas.' The Digger Indians of California received their name because when white men first saw them, they were busily occupied in searching for these and other bulbs and roots."

The living wild flowers shown at this spring's exhibit, by far the finest and best wild flower show ever held, embraced many of the commoner, and a number of the rarer, plants and blossoms from an area more than 800 miles in length by 250 to 300 in width. While specimens of only one-fifth of the total number of varieties of wild flowers in the state were gathered together in this exhibit, it is believed that at least one representative of every botanical family known to the state was present in the collection.

The idea to be carried out in conserving and protecting the wild flowers, is to place the control of these flowers in the hands of a commission, somewhat similar to the present fish and game commission, and, possibly, as a branch of that organization. Regular study of the flowers and flowering shrubs would be made by experts attached to this commission, just as studies of birds and mammals and fishes have been made by the state fish and game commission. No attempt will be made to prevent people plucking flowers, or transplanting wild flowering plants, but they will be prevented from destroying them, or at least would have to pay stiff fines when caught doing so.

The luxuriance of the California flora is responsible for the conservation movement. Leaders expect the rest of the country to follow.

Wild clematis bank, one of wild flowers which resist domestication, and for which Mrs. Bertha M. Rice (above) inaugurated California protective movement.

Watterson Bridge Proposed

ABOLISHING the Mason and Dixon line, as a memorial to the late Colonel Henry Watterson, by erecting a $15,000,000 bridge linking Kentucky and Indiana, is the ambitious project launched at Louisville, Kentucky, by a volunteer citizens' movement.

While plans are yet in an embryonic state, sufficient headway has been made to assure success. It is proposed to celebrate the opening with a national exposition in the "gateway of the South." Many great trunk highways pass through Louisville from North to South including a proposed international Peace Highway to connect Canada and Mexico. All these will be given free passage over the Watterson Bridge.

According to tentative plans, the lower deck of the bridge is to be used for railways and vehicles and the upper for displaying Louisville's manufactured goods and reciprocal displays from other states and nations.

On the Indiana side, arrangements are being made to link the bridge terminals with various city improvements and interstate highways, and on the Kentucky side, with a huge municipal auditorium, memorial museum and terraced driveways along the entire river front.

Among the specimens shown at the California wild-flower exhibition were the Mariposa Tulip (upper right) the Matilja Poppy (center) and the Yellow Calochortus (upper left). In the lower left hand corner is the now almost extinct variety known as Baby Blue Eyes. Wild Trilliums growing at the base of redwoods are shown in the lower center picture. Roland Rice has been his mother's assistant in the movement for wild-flower conservation.

Cypress Celebrated in Legend and in Fact

Concluded from page 3

sides baled commodities and slaves. Other canoes carried 80 and 100 barrels, after they were sawed in two lengthwise and made wider with slabs.

History abounds with mention of cypress. The first capitol building in Texas was built of it. Old records in New Orleans tell the story of the first waterworks system successfully operated in the United States. It is not clear just when the system was established, but it became a matter of record in 1811, when Benjamin Latrode took over the system. In 1833 the plant was taken over by the Commercial bank.

Until recent years the greatest curiosity in New Orleans was immense cypress tanks. They were cisterns, and on the outside of every residence was one or more of them. There was no other supply, for New Orleans was built on marshes, and if you dug a hole a few inches deep anywhere, marsh water gushed up. Hence, wells or cisterns below the surface were out of the question.

To meet these requirements, a waterworks system was devised to supply the district lying between Canal street, Esplanade avenue, Rampart street, and the river, boundaries of "old New Orleans." Five-inch holes were bored from end to end of cypress logs, which were 18 feet long, and averaged 22 inches in diameter. These were the mains, and they were joined end to end by iron connections driven into each log. At the ends of various mains were wooden plugs to cut off water from delinquent customers. A large wooden tank was built at the foot of Canal street, wooden pumps were installed, and slaves never ceased pumping water into this tank. The mains connected with this tank, and the gravity system of distribution was employed.

Scientists have written much about the very ancient lineage of cypress. They say that the entire north temperate zone, even into Iceland and Greenland, was covered. Conditions changed, and cypress was crowded into swamps along the Atlantic coast, the Gulf coast, and the Mississippi Valley as far north as Southeastern Missouri. Dispossession of cypress took place long ago, as evidenced by standing stumps of cypress —thousands of them together—carried down to the mouth of the Mississippi River, and covered with sedimentary deposits. These stumps were exhumed during dredging operations in Southern Louisiana. Cypress logs 20 feet below the level of the mud on the bottom of the Gulf of Mexico have been found. At the rate of deposit of mud by the Mississippi River, it required the settlings of 10,000 years to bury the logs to that depth. The logs were growing trees some 20,000 years ago.

Herbert Ward—An Artist and Adventurer

Concluded from page 2

Ward's return, he learned that a party of Africans had been brought over to the Brussels Exhibition. He went to their barracks, and in spite of changed apparel was immediately recognized. They called to him "Nkumbi." They were seated around a fire eating and showed their pleasure at seeing him. The Bangala language, in which he had gained a certain proficiency, had, until that moment, passed entirely from his mind. He found himself replying spontaneously to questions, but each time he became conscious of his own voice uttering those strange words, he ceased—the spell was broken, and he could not continue.

Before the war the Wards visited Mr. and Mrs. Thomas Nelson Page at Washington. They witnessed the presentation to the Wright brothers of the first Langley medal by the Smithsonian Institution. Mr. Ward was deeply impressed and told his friends that perhaps the Smithsonian was the best place for his African collection.

When the war came, he volunteered with the British Ambulance Corps. A bursting shell lamed him, he was mentioned in the dispatches and decorated with the Croix de Guerre. Two of Herbert Ward's sons were in the conflict. The elder, Charles Sanford Ward, was killed at Neuve-Chapelle. His second son, Herbert Sanford Ward, was severely wounded in an aerial duel and captured after his machine had been shot down behind the German lines. After the armistice, although broken in health, Herbert Ward went on a tour of inspection through Poland. Returning, he was taken seriously ill at the American Embassy in Rome. His friends, Ambassador and Mrs. Page, cared for him. He never fully recovered, and died in August, 1919.

Shortly after her husband's death, Mrs. Ward communicated with Dr. Charles D. Walcott, secretary of the Smithsonian Institution, in regard to the collection. Herbert Ward left no will so she was free to dispose of the collection. Many large institutions in Europe were eager to acquire it but she remained true to her husband's wishes.

The work of dismantling the collection was begun last July and in November, Mrs. Ward sailed from England to assist in arranging the collection. She wished to reflect the atmosphere of her husband's studio in Paris.

After months of work the exhibit was opened recently. A large part of the second floor of the museum has been set apart and the windows have been shaded to suggest the semi-darkness of the jungle. It occupies the same relative position as the famous Roosevelt collection, at the opposite end of the museum.

An Antidote to "Jazz" in Real Music

Plantation Melodies of Negro in Striking Contrast to "Ragging"

By LEONORA RAINES

IT IS not at all true that present-day "jazz" songs and dances are merely an expression of Negro animalism. Animalism is not confined to the Negro race. Possibly, in its primitive and innocent and therefore natural forms, animalism is not very objectionable. What revolts and disgusts all right-minded people in "jazz" is its very obvious origin in the degenerated animalism, the unclean manifestations of an atavism, which, in its reversion to primitive traits, reveals a decay symptomatic of sensuality.

Travelers generally bear evidence to the superior morality of the simple and primitive tribes of Africa and of Central and South America. In their nudity, they have preserved a degree of modesty comparing favorably with that of the elaborately clothed civilizee. Accordingly, it is not in the natural animalism of the West African tribesman roaming his native jungle, nor in the folklore and the melodies of the old-time plantation darkies of the South, that we are to find the real origin of "jazz." It is rather in the habitues of the bars and dives of the underworld. These have embalmed the indecencies, along with their often pathetic and even tragic experiences and sensations, in the songs and dances which at this day bulk so largely in stage entertainments, and which, like a noisome pestilence, are invading the ballrooms and the homes of the people of America.

These facts are brought out very plainly in a recent article on the Leightons (Frank and Burt) on the origin of "Blues" or "Jazz." They tell us, for instance, that "to one who has glimpsed the sources of jazz music it always comes with something of a shock to hear some sweet young thing tinkling the piano in the sanctity of a good American Methodist home, as she sings:

"'Won't you come home, dear daddy, please dear,
come home,'
"She cries the whole day long.
"'I'll do the cooking, honey, I'll pay the rent,
"I knows I'se done you wrong.'"

"Soon after the close of the War for the Union, the Negro quarters of American industrial cities began to grow. Huddled in vile slums, black folk and yellow were brought into contact with the more vicious and criminal elements of the whites, and the child-nature in some of the blacks succumbed to vice, although many held their own and by industry and probity climbed into self-respect and useful citizenship. But the ragtime melody grew in lawless haunts. The Negro at his worst lives in an abandon seldom approached by the most reckless of white debauchees. Never acquiring the hard cynicism of the white sinner, the black loves and laughs, gambles and fights, with an ardor all his own. When the outburst of hot animalism dies down and the dicer has lost his last dime, the gunman or the razor-wielder lands in jail. When this climax comes and the lover and his mistress are torn apart by jealousy or death, the black man's sorrow and remorse translate themselves into characteristic songs."

There is much logic and common sense, therefore, in the suggestion that a powerful antidote to jazz might be found in a general revival of interest in the old-time Negro melodies, with their suggestion of deep spiritual depths, of joyful dance rhythms and of subtly contrasting minor chords.

In our overcrowded life of today, little attention is paid by the multitude to folk songs or basic melodies. Yet composers, looking for material on which to build their themes, or artists seeking something sympathetic to give an audience, will turn to this music. In America there is great foundation for such inspiration — perhaps greater than in other countries, because of the number of themes available. McDowell, greatest of American composers, believed that this Negro music, along with that of the Indian, would contribute much to the future American music.

Antonin Dvorak was right when he said that in plantation melodies there is "a wealth of harmony in its highest form," and proved it in the making of his "American Symphony," the most beautiful movement in the composition being the adagio, which is built around a Negro air.

There is the *acciacatura* preceding the long plaintive note; again, there is the suggestion of *grupetto* before the full note with some modification. This continues throughout, with a *tempo* that is slow rather than fast. With another singer, the song would appear dragged, but the Negro has a way of filling in the space with veiled, unwritten notes that add to the individuality and refinement of the composition. To an ear unaccustomed to the strains, the stretched-out notes may have a monotonous effect, although each bar is really different.

Just as the origin of folk songs in other lands is unknown, so it is unknown under what condition the harmonies originated. It was the heartbeat of the race rather than the district or clime. History confirms the theory that folk songs are the spontaneous outbursts of toilers in all countries. Races of the soil, they spring from the hearts of those who earn their bread by the sweat of their brow. Negro melodies, with their syncopation, may have originated in a muscular blow of the foot or arm. A legend tells us that the pyramids were built to music, because the masons accomplished more under the influence of rhythm; and surely some of the old songs of Egypt owe their origin to the temples and pyramids. The seaman's "chanty" is universal.

We have no reason for believing the original themes in every case were of sacred order, except as the Negro takes everything religious emotionally. It appeals to his primitive, imaginative, mystic nature, hence the adoption of Bible words in many popular ditties. The Bible was the only book read to the slave, and the Sabbath, a holiday from toil, was a day of rest and song. Naturally, the melodies were cast in religious form.

When the Negro came to this country on a Dutch trading vessel in 1619, landing at Jamestown, he brought to us his voice and his music. It is his inborn love of the mother of the arts that has gained for him a part in our national character. If the Negro had not had this gift of expressing himself in melody, he most probably would have counted for little.

The songs were sung during many generations by slaves throughout the South, but their appeal did not become world-wide until after emancipation. In 1871, the Fisk University, of Nashville, one of the early institutions for the education of former slaves, formed a group of men and women to enable the outside world to hear and put a true value on Negro music.

The company, a double quartet, started on its tour, which was noteworthy as the first of a band to introduce to the public how the Negro could sing. The voices of the singers were trained only in that they learned their repertory of songs, and their respective places in the quartet. Under the direction of Professor George White, the blacks gave their first concert at Oberlin, Ohio, in October, 1871, where a national conference of the Congregational churches was in session.

On the day the Negroes arrived, everything was in confusion at the conference, and as business of an important nature had to be settled and the time was limited, their request to be allowed to sing was waved aside. Knowing that everything depended on their getting a hearing, the musicians formed a plan. They stole around to the open gallery, cut off but not concealed from the main auditorium.

Speaking of what followed, Cleveland Allen says:

"All of a sudden there floated over the large convention hall the soft strains of 'Steal Away to Jesus.' There was a commotion, as eyes turned in the direction of the singers. A hush fell over the audience as the song floated over the assembly. There was pathos, harmony, sympathy in the song, and they made that vast audience, some of whom represented New England culture, actually see the slaves stealing away to Jesus. The singers stopped, but the convention cried, 'More,' and then came more of the Negro music, and from that moment to the present, no one doubted the place these songs had in American life.

"Fortunately for the Fisk singers, Henry Ward Beecher was visiting the convention, and after he had heard the Jubilee singers, he arose in the midst of the convention and invited them to come to Plymouth Church, Brooklyn. The singers, accordingly, started East, and as their coming had been widely heralded, capacity audiences greeted their first appearances. The Negroes were praised by news critics, and the success of the tour was assured."

The singers traveled throughout the northern states and then went to Europe. While they were in England, Dwight Moody was holding a religious revival in London, and he made frequent use of them in his meetings. For seven years, the Negroes covered the Eastern and Western Hemispheres, bringing back a fortune of $150,000. This money was applied toward the erection of Jubilee Hall, a building dedicated to Negro music that now stands on the campus of Fisk University.

Jubilee Hall, indeed, rests on the very spot where once a slave pen stood. Fisk University stands for the best exponent of Negro music, and has set the example to similar institutions in Atlanta, Hampton, Tuskegee and other southern colleges. Since the music has had its chance before the public both in the North and South, it has grown in appreciation. Its strains are perhaps best loved in Virginia, the Negro's first home in America.

There is no fear of the old songs becoming back numbers in the South. They have been adopted by many white ballad concert singers and entertainers. As for the original and primitive collection, the number is small, but many airs have been composed after the original harmonies, and it is conceded that the Negro has done the work better than could the white composer. Yet the continuing popularity of such adaptations of Negro themes in both words and music as "Dixie," "Old Kentucky Home," "Old Black Joe" and "Swanee River" testify to the vitality even of its imitations.

A southerner, Mary Gillen, realizing that Negro folklore was passing and loving the songs as all southerners do, recently went to the heart of the matter and toured the South to linger at plantations where the blacks picked cotton, carded, quilted, crooned and sang as had parents and grandparents before them. Having notebook and pencil with her, Mary Gillen jotted down combinations with words.

The Negro is never so much at home as when he sings, and he loves an audience. So the presence of the stranger taking notes was no check on his music. The listener got "copy" just as Joel Chandler Harris got "copy" from Uncle Remus as he listened to the old Negro tell the little boy stories of "Brer Rabbit" and "Brer Fox." The blacks that sing the old songs still abound throughout Mississippi, Alabama, Georgia, South Carolina and Virginia. In these states, the old melodies may still be collected for preservation.

The reason for the failure of some of the melodies is in the fact that they were learned in a studio, where "style" and "effect" are sought above everything else. But the successful interpreters of the music are usually southerners, who were brought up among the blacks, learned their voice inflections, and in childhood caught the spirit of the Negro rhythms.

If one doubts the spontaneity and soul of the "spirituals," he should visit a Negro camp meeting and feel the swing and power of the irregular cadences. The Negro does not think of "breath control" as he lets the voice flow freely. And as for "effect" he knows nothing of it. Some white "artists" would sing "Rise, Mourner, Rise," "Swing Low, Sweet Chariot," or "Jesus Walked," as they would Brahms or Handel. By such misconception and misapplication they would rob our song literature of some of its richest gems.

This impressive view of the Gorge of the Columbia was made from Inspiration Point and shows Crown Point and the Vista House in the middle distance. The Vista House is a memorial to Oregon pioneers and is one of the most popular stopping places for tourists traveling the Columbia River Highway.

"Uncle Joe" Retiring After 62 Years' Politics

Foe of Humbug, Friend of Party's Enemies; Former Speaker a Link With Lincoln's Time

By AARON HARDY ULM

"UNCLE JOE" CANNON is going to retire. After March 4, 1923, the most picturesque figure at the national capital, the man who has served the greatest period of time of any one person in the United States Congress proposes to take a rest. And though he was 86 years old on May 7, "Uncle Joe" is working just as hard, during this, his forty-sixth and last year of congressional service, as during his first year in Washington. He still enjoys draw poker and still defeats at dominoes the star players of the National Press Club. He still chews black cigars continuously, and enjoys and can participate in a joke.

A year or two ago, the National Press Club in Washington devoted an evening to honoring "Uncle Joe" Cannon and the late Champ Clark. Nicholas G. Longworth, Republican Congressman from Ohio who presided, introduced Clark as the best-loved—on both sides—member of the House of Representatives. It would have been superfluous to have added that "Uncle Joe" Cannon was the best-liked—on both sides—member of the House. Champ Clark was loved by all and liked by many. "Uncle Joe" is liked by all and loved by most. All assent to Henry Watterson's estimate of him: "Here is a man who may be depended on to do whatever he undertakes, whether for good or ill. He is a man."

Softness is foreign to "Uncle Joe's" nature. When he hits, he hits hard and mercilessly. His affections are illimitable but they never stand in the way of his doing what he believes should be done. Gentleness, in the usually accepted sense, is with him synonymous with effeminacy. When the struggle is on he asks no quarter and gives none; when it ends it is over; it never extends to anything foreign to the issue. "Uncle Joe" is never personal in his partialities or his prejudices. Sentimentality is to him disgusting. He looks on politics mostly as humbug, and politicians, himself included, as humbugs. Life, personal and public, has been to him a game, much like poker or dominoes, and he has lived it largely as he would play any game—always with a true regard for sportsmanship, and the eternal verities.

With all that, "Uncle Joe" Cannon is no crabbed pessimist. Despite his years he has never yielded to the inclination to look upon the past as best, the present as futile and the future as hopeless. When, five years ago, the House stopped the wheels of its partisanship to pay tribute to its "Grand Old Man," on his eightieth birthday, Mr. Cannon, among other things, said:

> "There are now more great men and more great women in the United States than there have ever been in the past history of the republic. Someone asks, 'Where are they?' And I answer: They are everywhere following their vocations; but when necessary, whether it be in Congress or in civil life, or upon the bench, in the state legislatures; whether it be in diversifying industries of the country and carrying on the business of the country, whether it be in following the plow or working in the machine shop, there will be found more people capable of self-government and ready to defend the flag than there ever have been since the discovery of America."

That from the man who had a hand in the first nomination of Abraham Lincoln and sat as a delegate in the convention which nominated Lincoln the second time, a man who was in office during the Civil War and has known intimately virtually every public man of importance since that day, a man from whose very name was coined a political word of opprobium, namely, "Cannonism," a man who, when nearly 80 years old, lost one of the bitterest fights known to the history of Congress—but who came up smiling, just as he is still smiling.

When Cannon was born in 1837, Martin Van Buren had just succeeded Andrew Jackson as President. Indiana, to which his parents carried him at the age of four from his native state, North Carolina, was a part of the western frontier.

Beginnings Like Lincoln's

IT WAS under early frontier conditions that Joseph G. Cannon grew to manhood. His early life was similar in many respects to that of Abraham Lincoln. Both were of southern origin, Indiana rearing and Illinois development. Cannon had to make his own way, his father having met with accidental death when the boy was 14 years old. Cannon got his first foothold on life as a country storekeeper, but, unlike Lincoln, he studied law in a school. Cannon hardly entered upon the practice of law before he began to take active part in politics, being elected state's attorney in 1861. With the exception of three periods totaling eight years, Mr. Cannon has been continuously in office. When he retires in 1923 he will have served 53 years in public positions, 46 years in the House of Representatives. For length of Congressional service, he holds the record. The nearest approaching his was that of the late Senator Morrill, of Vermont, who served in both House and Senate a total of 43 years, 9 months and 24 days.

When Cannon entered Congress, James G. Blaine, then only 38 years old, was Speaker of the House. "Sunset" Cox was a leading Democratic member. Cox gave origin to the earliest known Cannon story with a congressional setting. The witty New Yorker was speaking when the new member from Illinois asked for the privilege of an extended interruption.

"I can't yield to the gentleman," said Mr. Cox, "for he insists on keeping his finger pointed at me, and I am afraid it will go off. But if he will keep his left hand in his pocket (Cannon being left-handed) I'll yield."

Cannon accepted the terms and began to speak with his left hand in his jeans. But after he got warmed to his subject, the hand came out and a finger shot forward in the direction of Cox.

"Time's up!" called the New Yorker, and Cannon sat down as the House laughed. But a little joke didn't daunt the gentleman from Illinois who soon developed into one of the best rough-and-tumble debaters Congress has ever known.

As a speaker, "Uncle Joe's" gymnastics have been as interesting as what he said. He waves his arms, walks back and forth and often does a complete about-face in emphasizing a climax. "He acts as though made entirely of spiral springs but the man who tackles him in debate must look to his laurels," Champ Clark once said.

Myths Around Personality

CANNON'S ability in debate, as that of most men in that field, has been due to his industry. Few members of Congress have had his capacity or liking for hard work. He always knows his subject.

As with all public men who establish fixed or quaint personalities there is much in the popular conception of "Uncle Joe" Cannon that is, at least partly, mythical. That is true of his alleged sulphurous vocabulary. The writer has seen much of him but never heard him use a profane word. He was reared in the mid-mannered faith of the Quakers and while he affiliates personally with no sect, his friends say that his sympathies still incline toward the faith that was his mother's and father's.

Another partial myth having to do with "Uncle Joe" concerns his smoking. While he affects long black cigars, he "wears" them more than he actually consumes them. While he always has one in his mouth—or such was the case until recently when his physician advised him to moderate the habit—he rarely finishes one. He merely chews up the ends and throws them away.

While he likes the good things of life, living being with him something worth pursuing for its own sake, "Uncle Joe's" habits always have been temperate. He rarely has tasted whisky, not because of scruples about moderate consumption of intoxicants, but for the reason that he simply doesn't like it. He has drunk very little wine or beer because those beverages didn't agree with him. His worst intemperance probably has been the habit of staying up late nights—he rarely retires before midnight. But being of a phlegmatic temperament, he has needed less sleep than most people. During most of his time in Washington, Mr. Cannon has lived at hotels. He has always kept his home at Danville, Illinois. He has never owned a house and only occasionally has had a residence at Washington. At present he is living in an apartment with his daughter, Miss Helen Cannon.

There is nothing that raises the ire of "Uncle Joe" as much as cant and affectation. Once when William Sulzer, of New York, made the rafters in the House of Representatives ring with a perfervid appeal on behalf of "the people," Cannon waited until the member got through. Then he arose and said: "And now let us proceed with the regular business and fool the people some more." Complimented one day on an able tariff speech he had just made, "Uncle Joe" swept his cigar to the angle that always caught the eye of cartoonists and remarked dryly:

"Yes, but I liked it better the first time I delivered it. I forgot the man I borrowed it from but if you'll look through the records you will find that someone else used it before I did."

Among aphorisms credited to him are the following:

> "Honesty if it is zealous without wisdom and without caution is as bad as dishonesty mingled with wisdom."
>
> "So far as disturbing the air is concerned, criticism and declamation do not affect legislation and concern me but little."
>
> "It is the easiest thing on earth to create an office, it is the hardest thing on earth to abolish an office."

His repartee, always parliamentary and generally kindly, sometimes has been biting in its acidity. Once when Congressman Boutelle threatened to break out of the party traces and run amuck, "Uncle Joe" remarked: "There are some men, Mr. Speaker, who would break up a funeral if they were not selected to drive the hearse."

In his long service on and many years chairman of the House Appropriations Committee he was a steady and persistent fighter for economy in the national government. A story, in connection with his work on that committee, shows how much of his partisanship has been, at bottom, only mythical. When he went on the committee, the clerk in charge of its detail work was a left-over from a Democratic Congress. The committee chairman, in line with a custom which still governs practically all other committees, was about to name his own clerk.

Put Aside Partisanship

"THE clerk we have had for the last four years is an unusually capable man, such as the committee needs regardless of the party in power," Cannon declared. "I propose that we keep him."

It was put to a vote and Cannon, the arch-Republican, voted with the Democratic members and won. The result was that James C. Courts, a Democrat, continued the clerk and expert of the House appropriations for about 40 years, in fact, until he died a few years ago. Not long ago in speaking of him Mr. Cannon declared that few men have rendered such inestimable service to the government as the almost unknown committee clerk.

"Uncle Joe's" lack of vanity was shown many years ago when he was asked to write a small sketch of himself. This was the result: "Mr. Cannon was born of God-fearing and man-loving parents. He made himself and he did a darn poor job of it."

Cannon was elected Speaker. After several years in the chair Congress turned him down more dramatically and humiliatingly than if they had failed to elect him Speaker. It was when "Cannonism," or the great power that steadily had drifted into the Speaker's hands, was abolished, despite one of the most determined fights ever made. For two days and nights "Uncle Joe," then 'way in the seventies, slept not a wink. After every member he could count on had reached the House, he let the contest come to a decision. He lost, but it never made one iota of difference in the general attitude of "Uncle Joe." Even after his defeat in 1910 and his return to the House of Representatives on the basis of a new member of the minority party, he took part in committee and floor work just as avidly as if it actually had been his first term. And on his last day there, barring illness which rarely bothers him, he will be just as attentive to his duties as on the first day nearly 50 years before. And even the bitterest foes of his theories of politics and government will be sorry to see him go.

Farmers Are Serfs of the Money Lenders

Only Relief in Sight Is Possible "Chance" to Borrow Even More Cash

THE farmers are bankrupt, "tenants at will" to the banks and investment public that lent them money. The farming industry has been on the down grade for many years, in spite of various plans, Federal and state, to put agriculture on a sound basis. These plans have either been theoretical or so bound with red tape and bureaucratic control that they amount to naught.

And now, what are the farmers promised? Legislation to aid them to borrow more money!

The Federal and state governments have spent many millions "to uplift" agriculture, but their agencies failed, because those in charge *did not comprehend the fundamental needs of the farmers.*

By GEORGE H. STEVENSON

OUR government is a liberal government. When one of the nation's industries proves to be lagging behind, Congress, bursting always with indiscriminate generosity, establishes, at the expense of the taxpayers, a new department, or bureau, for nursing the ailing industry. And so, through the years, these bureaus and departments have multiplied, developing into a super-government, to which political parties in power have gradually come to delegate their prerogatives, receiving in return therefor governmental patronage. This super-government, bureaucratic by nature, ingrowing as to vision, dictating and directing as of the divine right of kings, has supplanted the real democracy. Out of touch and never really in sympathy with the weal or woe of the common man, sensible only to that power or psychology which results in ever-increasing appropriations, this super-government moves on, pausing only to inject the needle into some lagging industry. The use of the needle is all right in case of an emergency, but its indiscriminate and continued use will wreck the most rugged of constitutions.

Likewise, generosity of governments in the making of appropriations for the advancement of its industries is justified only to the extent that such appropriations bring fundamental relief. When a thorough diagnosis discloses the fact that the patient is growing steadily weaker it is well to consider a change of medicine, not merely an increased dose of the same thing.

And so it is with agriculture. Liberal appropriations in the name of and for the benefit of agriculture have fallen short of the mark, not because there was not need for governmental recognition of the importance of agriculture, but because the expenditure of such appropriations has been carried on by bureaus and departments largely hidebound by bureaucratic tendencies.

The Department of Agriculture was established in May, 1862, with an appropriation of $60,000. In 1900, $3,006,022 was appropriated; in 1910, $15,470,634.16; in 1920, $33,899,761, and it is now reported that the next annual appropriation for the advancement of agriculture will be in excess of $35,000,000.

In addition to the appropriations made by the Federal Government for the benefit of agriculture, the 48 states of the Union appropriated in 1910 approximately $18,000,000, and in 1920 something over $30,000,000—a total for both Federal and state in 1920 of nearly $65,000,000.

Expenditures Without Help

IT IS apparent to thinking persons that the expenditure of these vast sums annually for the uplift of agriculture has failed to stem its downward trend, and it is well, therefore, that the nation as a whole should at this time pause and consider seriously the status of agriculture. I venture this suggestion on the ground that if the stereotyped belief of the masses of our citizenship to the effect that the "farming class is the backbone of our civilization," and "agriculture is the corner stone to our prosperity," is true, then it is the part of wisdom that the country as a whole acquaint itself with the true condition of its backbone, and examine carefully the corner stone to its prosperity.

I am not only a farmer at heart and in fact, but I have studied the problem from many angles, having been engaged in the farm loan business for private interests; president and director of one of the 12 regional Federal Farm Loan Banks; the manager and a director of a national farm organization, and the organizer and manager of a state farmers' organization dealing in the marketing of farm crops. I have been listed as an expert in agricultural extension in the service of the Federal Department of Agriculture, and in that connection was directed to study the department as a whole and work out plans for its reorganization along lines which would tend to make it more effective.

Now, out of this varied and fundamental experience, I make the statement, and shall offer proof, that the farming industry has been on the down grade for many years; that, in fact, a liquidation of the farmers' assets during any year of the past 10, on a basis of a valuation fixed by the earning power of his investment, after allowing the farm operator, be he tenant or owner, a wage equal to that received by the unskilled laborer of the factory, would not have paid the indebtedness now charged against this industry in the form of secured and unsecured loans.

The uninitiated will attempt to offset a statement as to the low wage received by the farmers, by calling attention to the increase in farm values, and insisting that the farmer can afford to work for a low wage, when the increased value of his land, from year to year, yields him, in the long run, compensation in addition to his annual farm income.

The benefits from this increased value of land are purely imaginary, as a careful analysis of the Federal census reports will disclose. The census report for 1910 shows the ratio of mortgage indebtedness on farms owned by their operators to be 27.3 per cent, whereas the 1920 census report on the same class of farms shows a ratio of mortgage to valuation of 29.1 per cent. A comparison of these reports also shows that during the 10-year period from 1910 to 1920, the valuation of this class of farms increased 77 per cent. Taking this as a basis, $100 invested in 1910 was represented by a mortgage of $27.30, and while by 1920 this $100 was increased to $177, the ratio of mortgage to valuation had also increased, and was then 29.1 per cent of the 1920 valuation. In other words, the debt in 1910 was $27.30 for each $100 invested as of that year, and in 1920 the debt was $51.50 for each $100 invested as of 1910, showing an actual increase in indebtedness of $24.20, an increase of 88.6 per cent in mortgage indebtedness, as against an increase in land values of but 77 per cent. Further, an analysis of available data leads to the inevitable conclusion that the farmers' indebtedness not represented by mortgage—his personal credits—has increased even more rapidly than his mortgage indebtedness.

These figures apply to farms operated by the owners, farmers who have actual capital invested in both land and equipment. Right here, I wish to call attention to the fact that inflated land values may be deflated by the action of economic laws, but the only way to deflate a debt is to pay it off.

Propaganda Boosts Land Values

INFLATED land values are primarily the result of organized manipulation, founded on misleading statements which prevent the natural functioning of economic laws. I recall, 10 or 15 years ago, the propaganda of the Federal Department of Agriculture, the state colleges, and of private interests, urging the farmer class, as a patriotic duty, to spur itself to greater production, else production fall short of consumption. During those years no man was more closely in touch with the Federal department and with the state agricultural institutions than was the writer, and during those years he pointed repeatedly to the fact that the increased production program was a propaganda set on the wave by such men as James J. Hill, who had millions of acres of land to develop, that his great railroad interests might prosper. Without leadership the agricultural industry blundered on, following these false prophets, and when conditions had finally reached the stage that the farmers themselves began to take a hand, then it was that the Federal Department of Agriculture and the state agricultural institutions changed track, and began discussing the necessity of increased credit to bolster up the farming industry.

During the past 10 years, responding to this new theory, the official exponents of agriculture have pressed the subject of rural credits, in season and out, and the first result of this agitation for rural credits was the enactment of the Federal Farm Loan Act in 1915. I have no fault to find with the Farm Loan idea, except that its potency for saving agriculture has been overestimated. Agriculture needs adequate financing, and the long-time-amortized mortgage is entirely practicable from the farmers' standpoint. It is unfortunate for the Federal Farm Loan system, however, that its control passed during the early stages of its organization to the bureaucratic domination of the super-government. This change of control came to pass when the specific injunction of Congress to the effect that the farmers themselves were to participate substantially in the management of the banks was peremptorily denied by the Farm Loan Board.

Now comes the next step proposed by the official advocates of agriculture. Once more the use of the needle—more money for the farmer through the medium of a personal credit system, supplemental to the Federal long-time mortgage loan system.

Fair Prices Essential

DID the farmer ever need greater production as the first essential to his prosperity? Did he ever need the Farm Loan system as the second essential to his prosperity? Does he today need as his *saving line* greater opportunity to borrow on personal credit?

The statesman, be he farmer, business man or educator, will tell you today, as he has told you for years past, that what the farmer needs, generally speaking, is not greater production, is not increased facilities for borrowing money, which he must pay back, but first must come fair prices for that which he produces, and upon the ability of the farmer to realize fair profits depends the weal or woe of American agriculture.

In conversation with one of our leading agricultural economists a few years back, the statement was made that to date this country had produced but one agricultural statesman, Dr. Seaman A. Knapp. It was Dr. Knapp who founded the farm demonstration work which Congressman Lever earnestly endeavored to perpetuate in the Lever Act. The fundamental principles of this service have been lost sight of, however, as evidenced by a recent so-called reorganization of the Extension Service of the Department of Agriculture, in which, in every instance, the men and women who had worked close to Dr. Knapp, and who had received a conception of the principles of demonstration through personal contact and service with him, were relegated to subordinate positions. I quote from this statesman and teacher, who, unfortunately for American agriculture, died too soon to save the fundamental work he originated in the Federal Department of Agriculture, from the denaturing methods of the bureaucratic elements, as follows:

> "Every substantial advance in the progress of human society costs money and must be maintained by an increased earning capacity of the masses. Food and clothing are the first requirements. If the earning capacity of a people is only sufficient to supply these, progress is blocked, and it is useless to insist upon better houses, more home comforts, schools, or any upward step. The problem is, are the rural masses unwilling to provide the betterments which a progressive civilization in the country demands—comfortable houses with the improved home and farm equipment, good schools and more months of schooling, better highways, rural free delivery, telephones, and so on—or do they lack the means? Upon the answer depends the proper remedy for existing conditions."

Statements of like import have frequently emanated from the prophetic pen of that able and fundamental scholar, Dr. Liberty Hyde Bailey.

A teaching which pretends to uplift without comprehension of the underlying causes for the condition of the upliftee is doomed to failure. The annual expenditure of millions for the uplifting of agriculture by those agents whose works have proved them to be uncomprehending of its fundamental needs, presents a tragic spectacle, of which the following are concrete examples:

Take, for instance, figures obtained by the Department of Agriculture on valuations and earnings of 100 average general crop farms in one of the leading agricultural counties of Indiana, typical of the good agricultural counties of Ohio and Illinois, showing the net average earning to the farm operator after allowing six per cent on the investment:

1910 net earning to operator	$ 144	
1913 net earning to operator	7	
1914 net loss to operator		$213
1915 net loss to operator		17
1916 net earning to operator	544	
1917 net earning to operator	574	
1918 net earning to operator	1,110	
1919 net earning to operator	818	

Thus the net average earning for the operator during the eight-year period is $371. In other words, this is the salary which the farmer received for laboring himself as a farm hand and managing at the same time an investment of $26,791.

Earnings Insignificant

I ALSO offer figures obtained from the same source, covering 60 average farms in one of the leading dairy counties of Wisconsin, typical of the dairy and hog farms of Minnesota, Iowa, Wisconsin and Illinois:

1913 net earning to operator	$ 41	
1914 net loss to operator		$120
1915 net loss to operator		106
1916 net earning to operator	449	
1917 net earning to operator	892	

The net average earning for the operator during the five-year period, after allowing six per cent interest, is $231, operating on a capital investment of $17,692.

Without going further into the detailed interpretation of these figures, it is well to point out that in the case of the Indiana farms, had the farmer invested the capital represented in his farm and equipment in farm mortgages at six per cent, and gone to the city and obtained employment as a factory hand, railroad brakeman or conductor, he could have earned say $1,500 a year; subtracting from this the estimated equivalent of rent and food obtained from the farm, say $400, and his earning would have been $1,100, as against $371. Can any man say that the average farm owner and operator has less ability than the average factory hand, railroad brakeman or conductor? Unless, of course, it might be construed as a sign of mental weakness that he remains on the farm at all, when as a matter of fact he could work shorter hours, earn more money, and provide a better home and better education for his children by moving to the city.

If these farm operators were hired managers, paid $1,100 in cash a year on an average, this amount deducted from the farm earnings would leave an earning for the farm investment of but 3.2 per cent in the case of the Indiana farms. Taking the 60 Wisconsin farms, on the same basis, and the net earning on investment would be but one per cent.

It is safe to assume that the mortgage, and unsecured or collateral credit of these 160 farmers, will average 40 per cent of the capitalization of their farms.

(Concluded on page 15)

The Romance of the Emerald

Gem of Spring Has Held Its Place for Ages

IF JACK wishes to tell Jill how perfect she is, let him call her "a flawless emerald." Jill can remember that this rule is plural in number; if she thinks Jack approaches within shouting distance of perfection, she might encourage his wavering heart by using the same expression. But the first user would probably need to explain the why of the phrase which is simply this: emeralds are invariably flawed, and a flawless one is so rare that its value would easily overshadow a diamond of the same weight.

Pliny, the Roman, told a story of an emerald which must have been defective. He does not say that it was, but the inference is present. The seller, of course, might have become suddenly conscience-stricken and disgusted with his mad career of profiteering. A flute player bought it for six golden denarii. Then the dealer returned two of the coins and thereby ruffled the purchaser's temper.

"By Hercules!" the man stormed. "He has done me but a bad turn in this, for the merit of the stone has been greatly impaired by this reduction in price."

Isn't human nature just like that today?

Perhaps the most active advertiser of the stone now is Ireland; but this all depends on whether the sight of the name in a newspaper or magazine brings to mind the term, "Emerald Isle." Emeralds are not found in Ireland, nor does the country derive its pet name from the greenness of the grass or vegetation. Pope Adrian gave King Henry II an emerald ring as the instrument of his investiture with the dominion of Ireland. If the ring had been set with a ruby, we would probably be calling St. Patrick's home the "Ruby Isle."

Emerald the Gem of the Spring

IN ANCIENT times the four seasons of the year were each represented by a stone. The emerald was the gem of the spring. To the Romans it meant freshness, growth, and the time when Nature awoke from her long sleep and arrayed herself in the garment of gladness.

"There is no color so pleasing to the eye as that of the emerald," Pliny wrote. "Whoever delights in the verdure of herb and leaf must enjoy infinitely more the contemplation of emeralds. No verdure can compare with theirs. They are the only stones which charm the eye without wearying it."

Pliny also praised the stone for its "soft green luster." Heliodorus pictured it "green as a meadow in the spring." Marbodeus, the poet, preferred verse over prose. It was he who fashioned this little couplet:

"The emerald burns intensely bright
With radiance of an olive light."

Seal rings of emerald were popular, for it was thought that the stone had the power to strengthen sight.

"If the sight," the old wiseacre, Pliny, declared, "has been wearied and dimmed by intensive poring upon anything else, the beholding of this stone doth refresh and restore it again."

Emperor Nero liked the idea, but he improved upon it. He obtained a light-hued emerald to use as an eye-piece or sort of opera glass with which to view the gladiatorial contests. Certain authorities say that Nero fooled himself and that the supposed emerald was really a bit of rock crystal.

The old Romans were somewhat queer. They held that the stone benefited human eyes, but that it would destroy a serpent's sight. Even in medieval times they retained this belief; and, moreover, it had spread to other peoples. In 1242 an Arabian gem dealer conducted his own experiment.

"I took a stick of wood," he wrote, "attached to the end a piece of wax, and embedded my emerald in this. I then brought it near the viper's eyes. The reptile was strong and vigorous and even raised its head out of the vessel, but as soon as I approached the emerald to its eyes, I heard a slight crepitation and saw that the eyes were protruding and dissolving into a humor. After this the viper was dazed and confused. I had expected that it would spring from the vessel, but it moved uneasily hither and thither without knowing which way to turn. All its agility was lost and its restless movements soon ceased."

Superstitions of the Romans

THE serpent was regarded as an evil creature by the Romans who also believed that nothing evil could remain in the presence of the emerald. They deemed the jewel a revealer of falsehood and treachery. They thought its influence for good so strong that it would burst out of its setting when powerless to avert misfortune, and thereby arose the belief that the falling of this gem is a bad omen. Worn as a ring, it refreshed the memory and protected from giddiness. If sailors and fishermen suspended it round the neck so as to lie upon the breast, it would guard them from all perils and mishaps at sea.

The emerald was a lovers' stone, too. Besides showing secrets, bestowing eloquence, and giving renown, it enabled Jack to test the sincerity of Jill and vice versa. In the words of Miss Landon, the English poetess,

"It is a gem which hath the power to show
If plighted lovers keep their faith or no;
If faithful, it is like the leaves of Spring,
If faithless, like those leaves when withering."

The ancients thought that the wearing of the jewel would prevent epilepsy and cure other diseases. Emerald dust was used as a medicine for internal use. As late as 1757 a firm of German druggists quoted a pound of the dust at eight groschen, or 25 cents, which indicates that the material was either a substitute or of inferior quality.

Wounds caused by burning could be healed by sprinkling powdered loadstone over them. This treatment, however, sometimes produced melancholia; but the physician need have no fear if he possessed a bit of emerald dust. If a solution made from the powder were taken thrice daily throughout a period of nine days, the melancholia would fade away.

The dust was considered quite effective as an antidote against poisons. If a person were dying, 80 barleycorns of the powder would counteract the effect of the poison and save his life. The Arabs prized emeralds highly for this purpose, but they used the whole gems. The Arab physician, Abenzoar, took a poisonous herb; he cured the ill effects by placing one stone on his stomach and applying another to his mouth. An Italian doctor followed the same method in combating disease; for liver affections, he placed a stone over the liver; for gastric troubles, he placed it over the stomach. It was a common belief that precious stones threw out a curative energy, but modern scientists say that radium is the only mineral possessing this activity.

In India the stone is widely known as an antidote for all animal, mineral and vegetable poisons. One name for the gem is "garalari" or "enemy of poison." The people of that country believe it confers the gift of memory, reveals secrets, and foretells future events. They value the emerald so highly that it is frequently used in the decorations of their sacred images.

Persians of high rank attach an emerald to the arm with a piece of green silk; with this good-luck charm they laugh at the machinations of the devil on whom they have bestowed the peculiar appellation of "Deebs." The Shah has a golden box set with emeralds and said to have been blessed by Mohammed. There is a legend that it can render members of the royal family invisible, if they so wish, as long as they remain unwed. The poor Shah, however, has so many wives he scarcely knows what to do with them. Consequently, he has not been able to test the supposed power of the mystic box.

The grass-like gem was known and esteemed in the most remote times of the world's history. In Egyptian and in Etruscan excavations the stones have been frequently unearthed. The principal modern sources of supply, however, are Siberia, India, the United States, Mexico, and Central and South America. The Peruvians of the present day retain the ancient belief of the Romans that demons guard the mines and that their anger must be appeased by gifts.

Lake Bottom Paved With Gems

CENTURIES ago the lake of Guatavita high up on the Andean plateau was thought by the natives to be the home of a mighty god who, when angered, would wreak fearful ruin. Gold and emeralds, unknown to the impoverished descendants of today, were plentiful among them. With their peace offerings to the powerful divinity the Indians literally paved the lake bottom, and it became a veritable treasury.

At the semi-annual festivals ropes were stretched across the lake from four temples at four equidistant places on the shore. The intersection of the ropes was supposed to be the center and nearest the god. One man, "The Cacique," coated his naked body with clay, and the principal chiefs threw gold dust on him. When the Spaniards came to Peru they called the figure "El Dorado" or "The Gilded." The chiefs and "The Cacique" were rowed out to the center of the lake where he would spring into the water, wash himself and swim to the shore. At the moment of his leap the chiefs and the multitudes surrounding the lake threw into it their propitiatory offerings of emeralds and other precious stones.

Many attempts have been made by adventurers to obtain the rich treasures by drawing off the water. One of the early efforts was partially successful, as the government's three per cent share is said to have been $170,000. The lake never has been effectively drained, though in 1823 all but 33 feet of the water was removed. It is now thought that the bottom must be dug out as much as 30 or 50 feet to unearth the richest spot of the gold dust and emeralds.

When Cortez pillaged Mexico he obtained five emeralds of rare size and beauty. One was shaped like a rose, another like a horn, the third resembled a fish with eyes of gold, the fourth had the appearance of a bell, and the fifth was a cup with a foot of gold. Gomara, the historian, stated that some merchants of Genoa named 40,000 golden ducats as the price they would pay for the cup, but Cortez would not part with it. In 1529 he lost all five of the splendid gems in a shipwreck off the coast of Barbary.

The largest single emerald known today weighs slightly less than ten ounces. It is owned by the Duke of Devonshire, of England. The largest ever found in the United States weighs a fraction less than nine ounces. It was discovered near Stony Point, North Carolina, and is now in the National Museum at Washington.

The green jewel is the May birthstone. If Jill first opened her eyes in this balmy month, Jack should buy her an emerald ring and give it with this appropriate verse:

"Who first beholds the light of day
In spring's sweet, flowery month of May,
And wears an emerald all her life,
Shall be a loved and happy wife."

Farmers Are Serfs of the Money Lenders

Concluded from page 14

Taking the Indiana farms and the average earnings for the eight years, and allowing the farmer $1,100 for his services each year, and the income over and above would pay only a trifle more than eight per cent on the indebtedness alone. Taking the Wisconsin farms, and allowing the farmer $1,100 for his services, and the net income over and above would amount to 2.7 per cent on the indebtedness.

After careful consideration of these facts, and particularly taking into account the fact that the foregoing figures include the years of high war prices, and do not include the blackest years of all, 1920 and 1921, ask yourself the timely question, "Who owns your farm?"

Forty or fifty years ago the bulk of our population resided on the farms. Constantly, during the years that have since passed, the trend has been away from the farm. Our cities have multiplied in number, and have increased in population to such an extent that today we find more than 70 per cent of our population residing in urban centers, leaving only between 25 and 30 per cent residing in the open country.

Reduced to Serfdom

THE tendency of civilization is to make of the farmer a producer of raw materials solely, with the manufacturing and distribution entirely in the hands of the highly organized, but not necessarily efficient, urban centers. No nation can long survive solely as a producer of raw materials, and, likewise, no industry can sustain itself for long solely on a basis of production of raw materials, leaving in other hands the marketing of the material in its raw state, as well as the manufacturing and final distribution to the ultimate consumer. It is the history of both nations and industries following this course, that the producer of the raw materials becomes steadily poorer, while the distributor and manufacturer become richer and more powerful.

The net result of this policy, applied to American agriculture, is that our farming classes have finally been reduced to a position of serfdom. I use this word advisedly—serfs to purchasers of farm loan bonds, to the holders of the mortgages, namely, the insurance companies and private investors, and to the banks and individuals who have loaned them money on short-time credit. A sad commentary on our agricultural leadership is that today the only solution they have to offer is a pledge for legislation which will make more money available for the farmer, a companion piece to the Federal Farm Loan system; when, as a matter of fact, the farmer has already poured so much borrowed money down the "rathole," that he is actually, and in fact, bankrupt as a class.

I have been on the firing line with the farmers for many years. We have pleaded for this and we have pleaded for that. Congress has ever, from my observation, been desirous of helping agriculture, but agriculture and Congress have simply formulated and enacted. Take as an example the Federal Bureau of Markets; farmers generally were in favor of this move, and Congress backed them up, but the intent of the farmers and of Congress in establishing this bureau came to naught, because the establishment of the organization was made under bureaucratic domination, lacking in comprehension of the fundamentals of the farmer's problem, the only motive being to go forward on the line which would result in the most rapid increase of appropriations, thereby extending the power of the organization.

Fads and Fancies

AND so it has come to pass, that the farmers, Congress, and the country as a whole, have created a great Department of Agriculture and 48 great state institutions, which may, with few exceptions, be described as representing the conglomerate expression of the fads and fancies of every citizen who has felt the spirit of uplift, or who has had an axe to grind at the expense of agriculture.

Secretaries of agriculture come, and secretaries of agriculture go, and along with them assistant secretaries, and still we have no constructive, dynamic policy for agriculture, other than to appropriate money. I do not condemn the bureau chief for being ambitious, nor do I condemn that vast number of individual workers in the Department of Agriculture and in the state organizations for the failure of the official organization to function up to expectations. They are ready and willing to do their part, lacking only constructive leadership capable of overriding governmental red tape and governmental bureaucratic tendencies, and driving the machinery into channels where the real problems of agriculture abound.

The situation is bad, and on its face there appears to be but two courses left open.

The first, and by far the most humiliating course for all concerned, is to continue along the present lines, which will lead soon to the syndicated method of farm operation, where the present farm loan bondholders and mortgage holders, and loaners of short-time credit shall have title in fee simple to the farms, pooling their interests in syndicate operations of the land itself.

The second course calls for "about face," under a dynamic, constructive leadership, capable of overriding the red tape, that circuitous and never-ending trail of the bureaucratic government, striking straight for agriculture as the basic national industry, letting the chips fall where they will. This course will test the spirit of both rural and urban people.

THE LIBRARY OF THE
UNIV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

Rats in the Montreal courthouse showed their contempt for the judge by eating his gown and silk hat when they were placed in the judge's chambers at night. Court stenographers had their notes eaten by rats during the night and civil suits involving valuable property were delayed through the disappearance of records. When "Exhibit A" in a murder trial was eaten, and the prisoner was liberated from lack of evidence, the authorities appointed an official rat catcher.

A bill to substitute an "aristocracy of brains for an aristocracy of birth" has been presented to the British House of Commons in an effort to reconstitute the House of Lords. The measure provides for a reduction in members of the upper house from 740 to 300, apart from princes of the blood. The measure also provides for the creation of peers for life with uninheritable title and privileges.

Anglican churches in Canada are using a new prayer book which takes the place of the one compiled in the reign of James I. The new volume is free of obsolete and archaic words and references.

Norway is making Cheddar cheese for England, Edam for Holland, Gorgonzola for Italy and Roquefort for France. Of the 2,000,000,000 pounds of milk produced each year, one half goes into the cheese industry and between thirty and forty million pounds of cheese are exported each year.

The world's largest paper machine makes a stub of paper 12 feet, 2 inches wide, 327 miles long every 24 hours, using 110 cords of wood. Three thousand five hundred acres of pulpwood are required to furnish the paper for one day's issue of the newspapers published in the United States.

A separate library has been provided for boys and girls of Pasadena, California. The library is situated in one of the city's parks, close to the downtown district. Save for the attendants, there are no adults.

Mystic symbols and signs were discovered recently, chiseled on volcanic rock in a remote section of Owyhee County, Southwestern Idaho. Certain of the inscriptions resemble Chinese alphabet characters and this resemblance was taken by some to substantiate the theory that the North American natives descended from a race which came from Asia by way of Bering Strait.

President Ebert, of Germany, who was prominent in the saddlers' union when he was a saddler, has been expelled from the organization because of his official attitude toward unions in his present position.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

Guarded by two United States Government cutters, the Pacific seal herd is moving from the South Pacific to the summer rendezvous on the Pribilof Islands in the middle of Bering Sea. This is the only herd known to be in existence with the exception of a small colony that summers on the Commander Islands, off the coast of Kamchatka, Siberia. After June 15 the herd will have passed into Bering Sea and three other coast guard vessels will then maintain a rigid guard there.

The withdrawal of a single steel rivet from an ocean steamship with a displacement of 25,000 tons can be detected by a new method perfected by the Bureau of Standards.

Soldiering is an expiring profession in Germany. Many former army officers are doing menial work. Droshkies, taxis and other horse-drawn vehicles in German cities are being driven by former commissioned officers. Common soldiers in the ranks are faring better than their officers. Thousands of soldiers turned to agriculture and trades for a living but the officers, who had made a career of the army, had no other training to make a livelihood.

British Columbia is so free from serious crime that there will be no assize courts at Clinton or Prince George this spring.

A mine operator near Madera, Pennsylvania, has notified his striking miners that he does not hold them responsible for the strike and in return for their loyalty in the past and in an effort to help them over their unemployment, the rents of their homes will be reduced 50 per cent and every employe will be allotted a garden plot.

According to a German official document published recently, the number of submarines lost by that government during the war was 199, including boats sunk, interned and captured.

Efforts are to be made during the coming summer to retrieve some of the $15,000,000 worth of specie which sank in the sea when the Laurentic was torpedoed during the war by a German submarine near Lough Swilly, Donegal. Previous salvage operations saved approximately two-thirds of the treasure and specially trained divers from the British navy are expected to recover the rest. The vessel lies in about 20 fathoms of water and the huge boilers rolling about make operations hazardous.

Eight thousand boys and girls in all New York City's high schools have enrolled as block captains in the spring and summer drive to keep the streets and vacant lots free from refuse.

While millions are starving along the Volga River in Russia, inhabitants of great areas of that country not remote from the Volga are malting and distilling their surplus grain and indulging in drunkenness after a long period of abstinence, according to the Moscow *Isvestiya*.

A horse, 51 years old, is living at Catawissa, Pennsylvania. He is the property of a minister who has owned him for 35 years. The horse is believed to be the oldest in existence.

A bridge has been designed to span the Hudson River at New York which will be the most important gateway to the West. Its lower deck will carry 12 railroad tracks, its upper deck roadway, two and a half times as wide as Fifth Avenue, will take care of 16 streams of vehicles. There will still be room on the upper deck for four surface car lines and two sidewalks. Although the bridge will cost $130,000,000 it is believed it will pay for itself by cutting the cost of bringing goods across the Hudson from $2.28 to 50 cents a ton.

It is said the game of golf was invented by Scotch shepherds, who, having nothing else to do, amused themselves by knocking stones about with their crooks. They measured off their holes in circles, because in that way they could keep watch over their herds. The holes were marked by a tag of wool attached to a stake.

Alexandre Dumas, Toussaint L'Ouverture, René Maran, and many other writers and scholars of France are of Negro descent.

In the town of Marhorst, Germany, two large steel shell cases have been hung in the steeple of the church and a clapper suspended between them. When the clapper is shaken by means of ropes the shell cases respond, giving a clear, resonant tone of great carrying power. During the war the bells of many churches in Germany were melted.

Mystery of the Vigilantes

CHRONICLER OF THE NEGLECTED TRUTH

Mystery of California's Vigilantes Is Cleared

Young Woman's College Thesis First Comprehensive Compilation of Facts

By HARRY H. DUNN

PROBABLY no two episodes in the history of the United States have been so beclouded by a fog of misinformation, as have the activities of the California Vigilantes of 1851 and 1856. The impression is general that these bodies—the second having been a reorganization of the first, although for a different purpose—were composed of impetuous, hot-headed, domineering men who went outside the law to enforce a law they had written for themselves. They have been referred to as "mobs," and accused of lynching, whipping and deporting innocent men, without form of trial. Even historians, who have had at least some records of those thrilling days at their command, have considered the two "Committees of Vigilance" of San Francisco, as having done a greater wrong in taking the law into their own hands, than would have been done by the men they punished so summarily.

Now comes, however, an explorer in the realms of records, with the entire written report of every meeting of these Committees of Vigilance, presenting a complete account of every step taken by them, of every man arrested, tried, punished, warned or released, and revealing to Americans pages of American history never before shown to them. The investigator, whose work has produced a valuable volume, is a woman—Miss Mary Floyd Williams, of Berkeley, California, the daughter of Edwards C. Williams who came to San Francisco as a first lieutenant in the famous First Regiment, New York Volunteers, under Colonel J. D. Stevenson, in March, 1847, and afterward became an active member in the first organization of Vigilantes in 1851.

By their own records, Miss Williams proves that the Vigilantes, instead of being mobs, were most carefully organized, composed of the leading men of San Francisco, whose deliberations over even minor cases often occupied days and nights before decision as to punishment or release, or even arrest of a suspect, was reached. They kept detailed accounts in writing of every meeting, of every debate and of the speeches made in those debates, and, thereafter, of every action and why it was taken. An unorganized mob scarcely would do this, and would be still less likely to enforce the rule that every man present at every meeting should sign the minutes, thus assuming full individual responsibility for every action of the committee. Regular trials were held, and every accused individual was allowed the widest latitude in obtaining witnesses, and in presenting their testimony, in which nothing was excluded. The benefit of legal talent within the Vigilance Committee was given to the prisoner, but the technicalities of the law, those loopholes, whereby the guilty might hope to escape punishment, were carefully sealed, and the simple theory of right and wrong as unfolded by the facts in the case was the basis on which decision was made.

These records were found in the vast mass of historic material assembled by the historian H. H. Bancroft, which became the property of the University of California in 1905, and is now incorporated in the magnificent Bancroft Library of that educational institution at Berkeley. Miss Williams, having learned of the existence of these records from Professor Henry Morse Stephens, made the work of finding them, putting them in readable form and presenting them to the world, the basis of her thesis for the degree of Doctor of Philosophy, which was awarded to her with much appreciation when her work of eight years was completed last autumn. It is doubtful if there is any written volume on any other two years of American history which compares in accuracy, extremity of detail and vivid writing, with this college girl's thesis on the "Committee of Vigilance of 1851." Accompanying her thesis, Miss Williams also presents for the first time, the complete records of every meeting of this Committee of Vigilance, without comment, as a reference work for the student, while the other volume is the story, told vividly and in plain language, of the organization, life and activities of the committee of 1851.

"Probably every one knows," said Miss Williams to the writer, "that the men who organized these Committees of Vigilance were respectable and influential members of the body politic; that for brief periods they assumed 'unlawful' control over criminal matters in their city; that they arrested and confined prisoners at their own discretion, hanged whom they would and banished from the state citizens and aliens whose presence they deemed a menace to public order, while the community not only tolerated their usurpation of power, but supported them in the infliction of the most condign punishments. But it is not so generally known that these societies which defied the law regulated their conduct by the ordinary practices of parliamentary procedure and kept careful records of their daily actions. It also should be explained that the committee of 1851 was organized to combat crime, and functioned in suppressing the activities of a number of Australian convicts, and others who followed the leadership of these convicts who had escaped from the penal settlements of the Antipodes and had been attracted to California by the discovery of gold there. The committee of 1856 was organized to combat political wrongdoing, civic unrighteousness and misgovernment of San Francisco by organized political gangs."

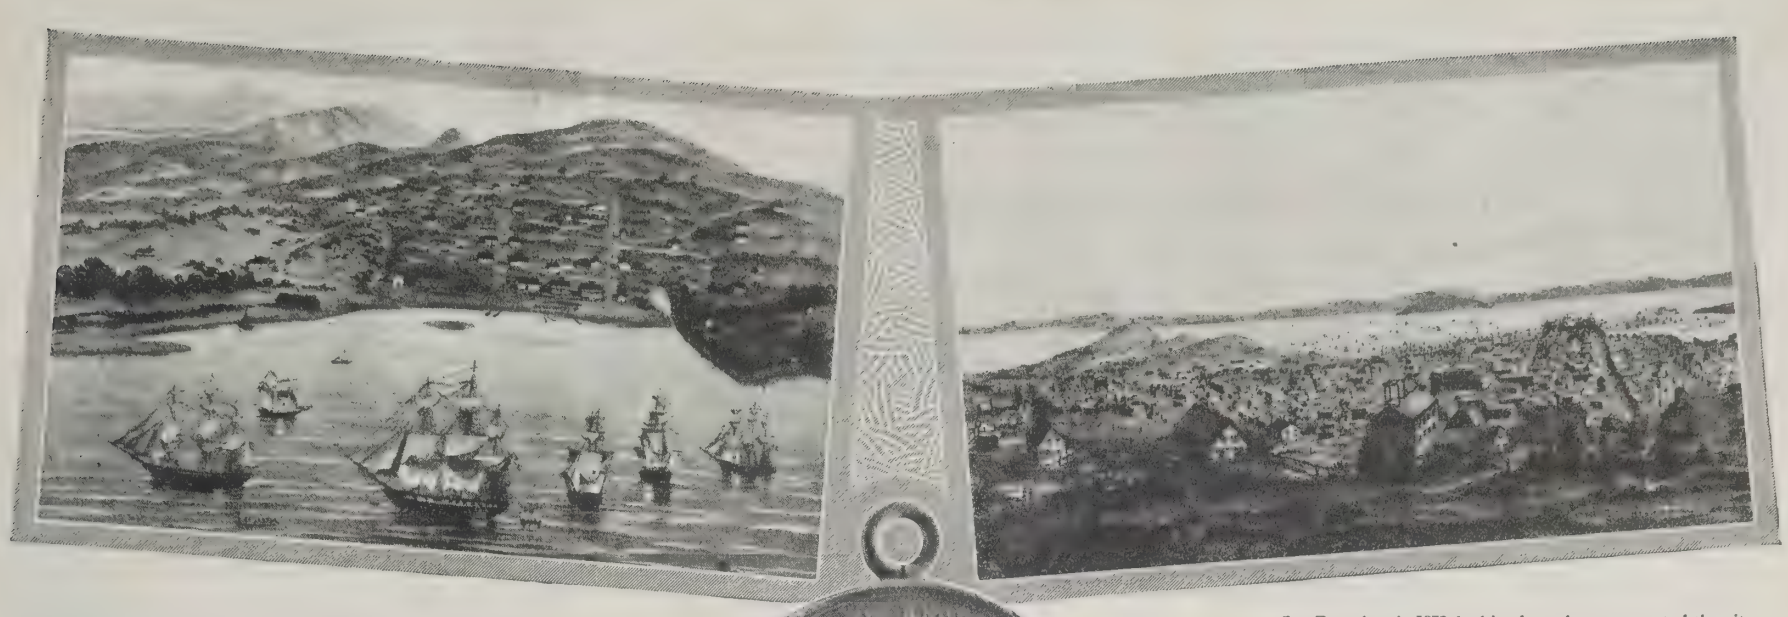
It is of the committee of 1851, the less known of the two, and, possibly, the more interesting historically, politically and psychologically, that Miss Williams treats in her investigation, which has been so highly considered by the University of California that it has been published as one of the university's own documents. In discussing the causes which contributed both to the necessity for and the organization of the Committee of Vigilance, Miss Williams goes rather deeply into the life that was lived when America was, in truth, the land of the Americans. She says:

"The frontier has ever been the laboratory of American democracy, where fearless men lay hold of the elemental forces that construct and destroy human society. After them have come the theorists, lamenting the catastrophes, explaining the triumphs, and formulating from the litter of the workshop, generalizations and warnings for artisans of a more cautious régime. The frontiersman in California dealt with conditions and special problems unlike those developed in the Trans-Allegheny valleys and the Mississippi watershed, but his equipment to meet the new environment corresponded very closely with that of American frontiersmen of every generation. The long succession of social experiments which had accompanied the extension of the frontier diverged widely in individual features, but they were all founded on a common acceptance of the theory that the state was created by a voluntary compact between contracting parties who possessed various inherent rights.

"This theory included a conception of a period when society was still unorganized, and when men lived in simple enjoyment of all their natural rights, subject only to certain laws of God and of Nature. It was conceded that, under particular circumstances, such as the violation of the contract by one of the subscribers, or the migration of a special group beyond the area in which the existing compact was binding, the organized people might resolve themselves into their original elements, and in their primary capacity resume the exercise of their natural rights, or form a new compact, suited to changed conditions. This theory was preached by theologians and expounded by statesmen, until it became an integral part of the national thought; it was the underlying force that impelled the Pilgrims of the Mayflower to pledge to each other mutual support and loyalty when they were obliged to establish their colony outside the territory in which their patent rights were valid.

"Such agreements were written and signed in pre-Revolutionary times by the people of North and South Carolina, who formed societies of 'Regulators' to punish crime and to check the extortion practiced by dishonest officials, the precise reasons for which the Committees of Vigilance of 1851 and 1856, respectively, were formed in San Francisco. The American precedent of voluntary association was followed by the revolutionists in Texas when they sought independence from Mexico. In 1835, they formed local 'committees of safety,' primarily to provide protection against Indians, and these became the nucleus for the general representative Committee of Safety, which, for a time, constituted the central government. The provisional government of the people of Oregon, one of the most successful experiments in frontier organization, was another striking example of the same kind of social agreement. We cannot understand the Committee of Vigilance of 1851, however, until we understand the failure of the courts of San Francisco to punish crime, and the consequent revival and survival of the resort to popular tribunals, that is, the Committee of Vigilance, which became better known in after years as 'The Vigilantes.'"

Out of the records which she has unrolled, Miss Williams produces first the fact that the Committee of Vigilance of San Francisco was organized on June 9, 1851, "when California had been a recognized commonwealth of the Federal Union for exactly nine months, though for nearly five years she had been under the flag of the United States, and for three-quarters of a century before the American occupation, she had been a part of the great colonial system which Spain had planted upon the Western Hemisphere." The investigation of these records shows that the entire period from 1848 to 1856 was one of ceaseless struggle for the establishment and maintenance of order, during a time of transition from Spanish customs, laws and usages, to those of the Americans. Two years of 1848 and 1849 Miss Williams considers a rather separate period within a period, occupied with the "struggle for organization." After this struggle for organization, when order was beginning to be established—but only in its beginnings—there arrived in San Francisco a horde of men from Australia, many of them convicts, the majority of them unscrupulous, to say the least, attracted to California by the discovery of gold. The presence of these criminal characters in numbers in San Francisco brought about the necessity, in the minds of the Americans there, of an organization which, under the failure of the courts to perform their duty, could and would maintain such order as had been established. This idea, doubtless, grew from the principles of organization, order and obedience to law, which these Americans—most of them transplanted from localities east of the Mississippi River—had inherited from their fathers, or had imbibed from their surroundings in their youth. Thus, out of necessity for the protection of lives and properties, grew the first, and, possibly, more important, of the two Committees of Vigilance, that of 1851.



"The population of San Francisco, at this time," said Miss Williams, "was about 23,000, gathered from all the ends of the earth. To this number must be added a constant swarm of non-residents, rushing from their ships to the mines, and then back again to take passage to other ports. To cope with all the criminal problems of the city, there was a force of about 75 policemen, and from statements made before

EDWARDS C. WILLIAMS,
Father of Miss Mary Floyd Williams, and a member of the Committee of Vigilance of 1851.

WILLIAM TELL COLEMAN,
Member of the Vigilantes of 1851, and president in 1856, probably the best remembered of all.

Above—Certificate of membership in the Committee of Vigilance of San Francisco, as reorganized in 1856. It bears witness that Richard Lowry is a member of the organization, and bears the number 3017, his designation in the committee and its operations. Below—MISS MARY FLOYD WILLIAMS, biographer of California's two "Committees of Vigilance," better known as "Vigilantes," whom she proves to have been sober, serious-minded and deliberate business men, banded to enforce the common law for the benefit of all.

San Francisco in 1846, prior to the discovery of gold which drew to it Australian convicts and Mexican malcontents, whose presence and actions made necessary the first Committee of Vigilance, organized in 1851.

San Francisco in 1852, looking from the upper part of the city out across the bay toward what are now Oakland and Berkeley. This drawing was made at the time the first Committee of Vigilance was in the height of its power.

the Committee of Vigilance, it is evident that some among these were confederates of the thieves."

Oddly enough, however, the immediate cause of the organization of the Committee of Vigilance appeared almost simultaneously in three cities. It came in San Francisco, through the delays in the trial of one Benjamin Lewis for arson; it arose in Stockton through demands that the rough element from Sacramento be suppressed, while Sacramento itself also urged that the criminals in all three cities be brought to book by popular movement. "It did not originate," says Miss Williams, "as is sometimes presumed, in the imagination of hot-headed extremists, who cowed the law-abiding community into temporary subjection. Extremists there were among the Vigilantes, but, as we study the records of their work we shall see that passion and violence were restrained to a surprising extent."

In brief, the Vigilantes of 1851 were a body of responsible men of substance in the community, banded to establish and maintain American laws, customs, usages and justice among foreign criminals, *not so very unlike the foreign criminal element abroad in this country today.* They believed in America for Americans, and an America of Americans, and they did not hesitate one second to risk their lives, their property, and their worldly all in compelling by force those who would not conform to American principles either to conform to them or pay the penalty for their crimes.

Of interest in this connection is the fact that about a score of the men who made up the Committee of Vigilance of 1851 were considered wealthy, while others made themselves prominent in business, the law, politics, or the professions in later years. The majority were small business men, clerks, physicians and the like, who handed down little save their family names to the future.

"It is probable that today no more than three men are generally remembered as leaders in the Committee of Vigilance of 1851," said Miss Williams. "They are Samuel Brannan, the first president; Isaac Bluxome, Jr., the secretary, and William Tell Coleman, better known as the leader of the later committee of 1856. Brannan, who has been accepted as the standard bearer of the committee of 1851, had been making history ever since he landed in Yerba Buena (now San Francisco) at the head of his colony of Mormons, July 31, 1846. He is said to have preached the first sermon in English in the streets of the town; to have performed the first non-Catholic marriage ceremony, and to have been *defendant* at the first trial by jury. He established the first San Francisco newspaper, *The California Star,* advocated the first public school, built the first flour mill, and made the first public announcement of the discovery of gold. A busy man was Sam Brannan, and a hot-head, so that it is not surprising that his personal qualities have been embodied in the reports of the ruling spirit of the association. Brannan conducted a store at Sutter's Fort (now Sacramento) in 1847 and 1848, and engaged in land speculation there, so that the official records of California of that period are plentifully sprinkled with his name. He offered the first resolution against slavery at the Sacramento meeting which selected delegates to the constitutional convention proposed for March, 1849. He was a conspicuous leader in the trial of the San Francisco Hounds, which antedated the first Committee of Vigilance, and he was elected to the *ayuntamiento* the following August.

"William T. Coleman was born in Cynthiana, Kentucky, 1824, lived for a time in St. Louis, and arrived in California in August, 1849. He devoted himself to commercial interests in Placerville, Sacramento and San Francisco, and was No. 96 on the roll of those who signed the constitution of the Committee of Vigilance in 1851, when he was only 27 years old. Five years later, he was president of the second committee, which cleared San Francisco of dishonest officials and politicians, as the first committee had cleared it of criminals against life and property. In spite of his southern birth and his adherence to the Democratic party, he was always staunchly loyal to the Union. In contrast to Brannan, Coleman stands for the pioneer of sound judgment and firm balance, successful not only in winning friends and fortune, but in long maintaining his leadership in the financial and social development of his adopted state. He acted on the subcommittee that superintended the first execution by the Vigilantes of 1851.

"Garrett W. Ryckman, who came to California in 1849, from Albany, New York, was the Nestor of the committee, being 53 years of age when he signed the constitution as No. 57, while George Ward, No. 62, was the *enfant terrible.* It is reported of him that he was 'as brave as Caesar, a perfect fire eater, a bit of a dandy, and a favorite with the ladies.' He was so short of stature that once, when he lost his temper in a business dispute with Michael Reese, whose chest he could barely reach, he thrust his pistol against the lowest button on the latter's vest and thundered: 'Be careful, Sir, or, by God, I'll blow your brains out!' He was, however, widely beloved and respected, in spite of his impetuosity, and there was no question of his true Americanism or his bravery."

Above—Medal of the San Francisco Committee of Vigilance of 1856. It reads: "Organized 9th June, 1851. Reorganized 14th May, 1856." From the collection of Charles B. Turrill, of San Francisco. Below—Banner presented to the Vigilance Committee of 1851 by the ladies of Trinity Parish, San Francisco, "as a testimonial of their approbation."

The committee of 1851 drew up a brief but comprehensive constitution, embracing only five points, of which the first, stating the name and objects of the organization, reads:

> "First—that the name and style of the association shall be the Committee of Vigilance for the protection of the lives and property of the citizens and residents of the city of San Francisco."

The complete text of this constitution, which lack of space forbids publishing here, merely made a declaration of purpose. It outlined no program beyond the provision that a subcommittee should be on duty at all times, night and day, at a designated place, to receive reports of deeds of violence, and to summon the general committee of the association for consideration of cases requiring further action. The need for action was shown by suddenness with which action came. Taking one vivid bit from the continuous romance of the hand-written records of the committee, Miss Williams transcribes the first case to come before the Vigilantes, as follows:

"The meeting of Tuesday evening, June 9, 1851, adjourned after 100 men had signed the roll. While a small group yet lingered in the room, a startling knock beat upon the closed door, and when it was opened, two or three members of the committee entered, dragging between them a powerful and defiant prisoner, John Jenkins, who, that very evening, had entered the office of George W. Virgin, on Long Wharf, seized a small safe, and dropped with it into a boat lying at the end of the pier. Virgin, arriving in time, raised a cry while the thief was still in sight. Seeing that capture was imminent, Jenkins threw his booty overboard and surrendered to a boatman, John Sullivan. David B. Arrowsmith, and James F. Curtis, members of the committee, assisted Sullivan in securing the prisoner, and George E. Schenck, who met them as they emerged into Commercial street, urged them to take Jenkins before the committee, instead of to the police station, as had been their intention. The suggestion was adopted, and, in a few minutes after their organization, the newly pledged Vigilantes faced the first acute problem to arise under their self-assumed responsibilities.

"In this case there was no doubt as to the overt act of violence, nor as to the need for assembling the general committee. Suddenly the bell of the California Engine Company struck a signal unfamiliar to the ears of San Franciscans—two measured taps, a pause, and then the two notes again, until every man within its sound had been caught by the summons. Quickly, the monumental bell echoed the call, and all San Francisco swarmed into the streets, soon humming with humanity. Brannan served as chairman, Bluxome as secretary, and, behind locked doors in Brannan's building, the thief went to trial immediately. A jury was selected; Schenck acted as prosecuting attorney, being officially appointed to the post; a jury was drawn, the evidence heard, and the verdict was 'guilty.' In the course of the trial, Jenkins was shown to be an ex-convict from Australia and to have had an unsavory record in San Francisco.

"Members hesitated when William D. M. Howard stepped forward, threw his cap on the table, faced the meeting, and said, calmly and evenly: 'Gentlemen, as I understand it, we came here to hang somebody.'

"The effect was instantaneous, and the meeting voted to hang Jenkins without delay.

"Brannan went out to a convenient sand hill and addressed the crowd, telling of Jenkins' arrest, his trial and the verdict, laying before the people all the evidence which had been placed before the committee. Then he demanded approval or condemnation by the people of the action of the committee. His answer was a tumultuous 'Yes,' but with a few dissenting 'Noes.' Later a coroner's jury, of which T. M. Leavenworth was foreman, implicated *some* of the members of the Committee of Vigilance in the execution.

"The following day, the newspapers published the following resolution, signed by *all* the members of the Committee of Vigilance:

> "'RESOLVED, that we, members of the VIGILANCE COMMITTEE, remark with surprise the invidious verdict rendered by the coroner's jury after their inquest upon the body of Jenkins, alias Simpton, after we have all notified the said jury and the public that we were all participators in the trial and execution of said Jenkins. We desire that the public will understand that Captain E. Wakeman, W. H. Jones, James C. Ward, Edward A. King, T. K. Battelle, Benjamin Reynolds, J. S. Eagan, J. C. Derby and Samuel Brannan, have been unnecessarily picked from our numbers, as the coroner's jury have had full evidence of the fact that *all* the undersigned have been equally implicated, and are equally responsible with their above-named associates.'

"This resolution gave to the world the names of the men who had taken upon themselves the task of protecting lives and property and of restoring order to San Francisco. Their work, not only in the Jenkins case, but in others which followed thick and fast, was approved immediately by the press and by the better element of the city, and their summary action in the case of the first criminal captured, no doubt went far toward preparing the city for the work the Vigilantes were still to do before either life or property could be safe in the San Francisco of 1851."

Party Fealty

WHY are you a Republican? Or why a Democrat? It would be interesting to learn of the reason for the party affiliation of the individual, and to learn how much of party history he may know. That most men inherit their party allegiance is patent, and that bigotry has more to do with party prejudice than judgment cannot be denied.

Party names are no indication of continuous party sentiment. The Bourbon Democrat can trace his party ancestry further into the past than can his political rival. Yet if he goes back far enough he will find himself classed by the detested rival name. For when, after the political rivalry of Jefferson and the elder Adams, party conventions succeeded congressional caucuses, the followers of Jefferson called themselves Republicans, while the Hamiltonians were Federalists.

Madison, "Father of the Constitution," was a Republican of the stripe of Jefferson, yet he was the projector of the protective principle in the tariff on imports, while the modern Democrat is in theory a Free Trader, except that he has not the courage to say so, and suggests the tariff is justified only as a revenue producer.

The name Democrat was applied to the Republicans in derision by the aristocratic Federalists. Since 1856 the principal political organizations have been known by their present names, but in character both have changed. Could Lincoln visit us today he would have difficulty in recognizing as his own the party that has wandered so far from his teachings. And who would think of making the policies of a Cleveland tally with those of Jefferson?

Jefferson, the Democrat, was the first public advocate of the abolition of Negro slavery. Lincoln gained immortality by achieving it. Madison, the Democrat, fathered the protective tariff principle, and while it is inconceivable that he would have supported it as it is in present practice, the idea has been a vital tenet in the theory of government of the latter-day Republicanism.

The student of political history must be aware of these facts, and the student of political history is becoming cynical regarding the reasons for party affiliation on the part of the masses. There are explanations of the situation other than mere inherited fealty, but they are hardly complimentary to the ideal of American citizenship.

Militarist Presumption

RECENTLY, Rev. Dr. Russell H. Stafford, pastor of the First Congregational Church of Minneapolis, has been going through an experience which should be a warning for every believer in the right of free speech.

The case arose in the discussion of the method of physical training to be established in the public schools. Without more detail it may be said the dispute was about strictly military training for the boys, or full calisthenics for both boys and girls. The minister appeared in behalf of the latter plan at the request of the League of Women Voters, who opposed the militaristic idea.

Dr. Stafford is in military service, a chaplain, in the Reserve Corps. He took pains in his argument to point out that he was not opposed to preparedness, but his experience taught him that military training was not adequate as physical exercise for the younger pupils, but was more suited to collegians, an opinion shared by many, and certainly within his rights. Of course, there were other speakers, some at least who opposed any military training at all, but that is not germane to the story.

Dr. Stafford was called to account by his commanding officer, who was not present, but who relied on a newspaper account of the meeting. The accused officer made a full explanation, but Colonel Baldwin initiated action against him on the ground that he had opposed preparedness, advocating a policy at variance with that of the War Department.

The further charge was made that Stafford, who had alluded to his Reserve commission, had used his official influence in opposition to other officers at the meeting who had favored military training.

Whether the matter culminates more seriously than the local flare-up, it is significant of a danger the people must confront. This country must always be on its guard against an aggressive military spirit unless it desires war at home or abroad.

Justice and Interest

IT MAY be in the interest of justice, but it certainly is not in the justice of interest, that appeal is to be made to Congress for the settlement of the claims of the collateral heirs of Robert Morris.

In 1781 the Pennsylvania financier borrowed $1,500,000 on his personal credit to help finance the Continental Army. This he advanced to the government, receiving bonds in return. When Morris was placed in the debtors' prison after the collapse of his personal fortunes, the bonds were lost.

Now, after 141 years, the descendants of the Continental financier's sister (he was a bachelor) have hired counsel and prepared to file claim for the debt of the Revolutionary days. There are various ways of figuring compound interest, but the Morris heirs have been moderate in their requests. All they want for the million and one-half in Continental currency is $80,000,000. This, any money-lender will tell you, is quite reasonable.

It is to be hoped that poor posterity, 140 years hence, will not awaken to discover that the world's 1922 debts, treated with multiplication-table interest, remain unpaid.

Hero Worship

FEW men in this world are without their idols. There is that in human nature which demands leadership, something which draws followers to the individual who seems born to command or assumes the position through mere bravado. Chance often has as much to do in creating such idols as has merit or the personal judgment of men or party. War, industry, commerce, accomplishment, some sudden service—any of these are apt to start a new hero from obscurity into prominence, and the public, blinded to all faults, at once knowledges him king for the time, and is eager to obey his every command.

History has given us many statesmen; some whose fame still is brighter than those who have succeeded in later years, and some of whom have been forgotten. Washington, Jefferson and Hamilton far outshine in fame their many able colleagues, Jackson never will be forgotten, while Lincoln earned a place in the world that perhaps will never be accorded another American statesman. Grant, whose early life was under more or less of a shadow and gave little promise of future eminence, even after the surrender of Lee, could not have dreamed of the national reverence now paid his memory. It was not Appomattox, nor yet his service in the presidential chair, that endeared General Grant to the whole country. It was misfortune, material and physical, and the bearing of the soldier under it, that gave Grant the sympathy of the world.

The old guard of the Democratic party made an idol of Cleveland, as did the reformers of Bryan, but neither has the lasting fame of a Roosevelt.

The latest idol to be set up is Woodrow Wilson, and his admirers are loyally awaiting his commands. It is not certain if he has had a cigar named for him, but, what is in equally bad taste, a magazine, intended to lead the party out of the wilderness, has been established. The *Wilsonian* is a monthly, quite able if one shields the eye from the glare of its adulation for its idol.

President Wilson has made a name for himself that will occupy a niche high in the Hall of Fame. Time only can give the proper perspective. Fair judgment cannot be passed on the man or his work now. He is better than his enemies would have us believe, but to insist that he made no errors is to deceive one's self. Woodrow Wilson was autocratic as a leader. His profession made him so. He was the antithesis of the ideal Democrat in action, yet his views were those of the patriot who believes in popular government.

Broadcloth and Doeskin

THE generation that fought the Civil War was hardly more different from the present in the modes and fashions of its women than it was of its men. Think back, if old enough, and view the passing throng on the street.

It is Sunday in a prosperous small town. Church bells are calling the faithful to worship. Here comes an elderly man and his wife. She looks no more odd in her hooped gown than he, in silk hat, broadcloth coat and doeskin trousers. With a dignity born of his Prince Albert and gold-headed cane, he pursues his way, conscious of his own importance as a sovereign in this great American Republic. No, he is neither doctor, lawyer nor banker. He is not of the business class nor a retired farmer. He is merely the type of the wage-earner of his day.

The particular individual held in the mind's eye is merely a printer. On his munificent salary of $8 a week, he and his estimable helpmeet have earned a comfortable home, reared a family, and are enjoying life in pleasant surroundings, contented and happy.

"Broadcloth and doeskin" are not in fashion now among workers, yet they were not then confined to the outer attire. Everything was genuine. The term applies to all the necessities and comforts surrounding life in those days. The printer was as much a fixture as the town itself. He was as certain as man can be of anything that his job was permanent. His home lot was also of the "broadcloth and doeskin" pattern, not of the restricted dimensions of the present, and sufficed for a garden that produced the major portion of his food consumption. There was room for a barn and chicken yard, and the cow gave them all their milk, the hens provided them with eggs and to spare, and the chalked returns on the back of the kitchen door gave mute evidence of the not inconsiderable addition to the family income.

Of course, all this was before the days of shoddy fabrics, when clothes for male and female wear were made to serve, dyes to be permanent, and all things to last. Few were so poor as to be dependent, and one's ability to earn was not confined to a single trade or part of trade. Industrial progress had not gone so far that the weaving of cloth was a lost art in the village, the shoemaker still plied his trade among his fellow citizens, every hamlet had its abattoir, liver was still out of the commercial field, and life was more simple. The custom mills still served to handle the farmer's grist, taking toll for pay, and the modern complexity of life was absent. Subscription wood then served the publisher and his help in keeping warm and opportunity for outdoor exercise, for the bucksaw and axe had not given place to the coal hod and scoop, nor the parlor stove and heating drum to the furnace and steam coils.

Cotton had not then superseded wool and labor was sought for its ability rather than for its possibility.

Whether modern life is an improvement may be a debatable question, but the fact that "broadcloth and doeskin" are no longer a common heritage is not to be denied.

Uncle Sam's Share

TO THE question, frequently asked and often erroneously answered, whether the United States shares in the profits of the Federal Reserve System, the correct answer is: "It does." Section 7, of the Federal Reserve Act provides that the net earnings, after payment of all expenses and a cumulative dividend of six per cent on capital stock and the creation of a surplus fund equal to the capitalization of the bank, shall be placed in the United States Treasury. To date an aggregate of $124,537,336 has been paid in as Uncle Sam's share of the profits.

There is this drawback to the plan—expense is subject to no limitation save the will of the Federal Reserve Board. Thus the marble palace in New York must be paid for by the people, while the $20,000 subordinates who formerly worked for private employers for from $1,500 to $3,000 receive the additional income from the public purse.

The amount stated as having been covered into the Treasury is very small compared with the advertised profits of the system, showing that waste and extravagance have been the rule. It covers five years, beginning in 1917, when $1,134,134 was paid; none in 1918; something more than $2,000,000 in 1919; nearly $61,000,000 in 1920, and $59,000,000 last year.

The Federal Reserve System is a complicated, cumbersome, expensive piece of machinery, and is open to attack for that reason. Its profits are tremendous, and paid by the whole people. There is no greater gain to the member banks than in ordinary banking, and no service to the people that a simpler system could not give. It is merely a money monopoly, administered in the interest of a money trust, and should be superseded by a plain, government-controlled system in which every one could have fair and equal treatment.

Mr. Ford's Page

A SPLENDID tonic for one's hope is to move about the United States and come in contact with the people—not with the public officials, the financiers and the big merchants, but with the people who live in the side streets and in small houses. When bewilderment marks statesmanship and depression marks business, and it seems from certain points of view that the country is in a bog, it is a source of renewal and inspiration just to get among the people of the different sections of this nation.

Such a statement is likely to be put aside as too tritely true, or as intended as flattery for the masses. The very tendency to put it aside is an indication that already we are so far away from the crucial significance of the people to these times, that we consider reference to them to be in the nature of meaningless oratory. Even individuals, when they speak of "the people," do so as if they themselves were outside of the people. The proper point of view is lost, of course, if we no longer identify ourselves with "the people." If Washington, for example, considers itself to be one group and "the people" another group, to be forgotten or feared or flattered as circumstances may suggest, it is a sign that one thing has become two, and the stronger part will not rest until the natural unity of the two is restored.

One of the follies of the governments in sending "missions" and "delegations" from one nation to another, is that these missions do not originate among the plain people of the country which sends them, nor do they ever see the people of the country to which they are sent. A "mission" comes here from France or England. It is composed of titles, estates and fortunes, represented by politicians and bankers with now and then a scholar thrown in for good flavor. And they proceed as far as Washington, where they bow to public men who are about as unrepresentative of the people of the United States as they can be. Something is said about knitting the people of the two countries in closer bonds of peace and good understanding—but the people hear nothing about it. And the "mission" proceeds to New York, where it is taken into the exclusive clubs and made free of certain palatial homes: and there is a banquet: and then some more words are mumbled about knitting the people of the two nations closer together—but all that the people know about it is the half column they see in the papers the next morning.

That is simply to illustrate the practical degree to which the people do not count in such movements, which is just another way of pointing out to what degree such movements do not count. If you watch the movements of those groups which theoretically are obeying the behests of the people (their proper style being "servants of the people") you wonder what is coming upon the country! The antidote is not to draw rash conclusions, but go out among the people and learn what they are thinking.

Washington is probably the most depressing city in the country today just because it does not know what the people feel and think. When you absorb a little of Washington's official atmosphere you will begin to understand what has put Washington on a side street, so far as its importance to the welfare of the nation is concerned. To official Washington, the People of the United States are not properly people at all—but merely voters: just as to the speculative financier, the People are not human beings with human rights, and bearing more than natural human burdens—they are entities to be manipulated for profit. It is this which makes Washington a source of depression to anyone who gets a good inside view of it—especially a view of those matters which every newspaper man knows, but which no newspaper reader is ever told.

It would be hard to believe that the seat of government could ever have become so unimportant in a constructive way to the life of the nation, unless one has actually seen it and had one's view confirmed by others who have actually seen it. It is positively alarming—until one remembers: "North and west and south of this city are 100,000,000, hardly one per cent of whom have ever seen Washington: see them before drawing conclusions."

Then out in the country once more, among the people again, one senses instantly what is wrong at Washington. The leaders there have lost vital contact with the people. They seem to have forgotten how the people think. Certainly their official and social exclusiveness is such that they scarcely ever see what the people really look like. The people are a nuisance at Washington—a confounded nuisance when they go upsetting perfectly good political machines as they did in Indiana and Pennsylvania.

Charity compels an explanation of how such a state of affairs originates at the Capitol of the Nation. With the election over, and the victorious office-seekers seated, that is about all that the people can do until the next time. Nobody counsels with the people after that. There is no machinery by which the people can counsel with the Government. Besides that, the people have something else to do. It is just because they have something else to do that they have selected and contracted with certain men to leave their regular employment and go to the seat of Government to look after the people's affairs there. Having done that, according to the machinery set up to secure representation, they are entitled to believe that they are being represented.

But such is not the case. When the "representatives" reach Washington they find there an established unofficial group containing representatives of everything which is antagonistic to the people's interest. Alongside this is another unofficial group having representatives who claim to be on guard for the people. The function of representing the people does not seem to rest with the duly elected representatives at all. The way it works out in practice is really this: the elected representatives of the people find themselves to be constituted a court which is expected to pass on the contests between the two groups of unofficial representatives who for various reasons have permanently settled in Washington. It is perhaps little enough wonder that in the resulting babel the elected representatives confuse the voices, forget the people, and become inoculated with that subtle Washington disease which causes its victim to consider citizens in their voting and numerical aspect only.

When men are mentally and morally tall enough to look over the heads of the Washington camp followers, and see beyond them the Hundred Million Souls for whose service and liberation Washington was set up, then we get true statesmen.

The people do have this advantage: they don't live by their ballots, but by their plows and their industry and by that highly organized mutual service which we call Commerce. When Government does not serve these, Government simply passes into a side street, and the nation marches on along the main thoroughfare.

The corrective of all false views obtained by observing the system as it works, is just to take a look around at the people of whom we are a part. Go into the South, and Middle West, and West, and Northwest. There have been preserved in some sections great blocks of unspoiled humanity, sometimes comprising whole states, in which the purest American accent in business, politics and morals is still as natural as the morning sun. The old psychic soil in which our earliest American principles were sown, in which they flourished, and in which they grow tall and straight, is still plentiful among us, and in a moral crisis will make itself felt. The noise of transient fallacies, the flare of feverish alien developments is so dominant in some communities as to lead people to think that it is typical of all sections. It is not. Whole sections have been preserved against the infection by a Providence which means well toward this country of ours.

EVERY country is just as sound as the people who comprise it. Measured by that, our country is in no danger. On the contrary, there is every sign that sooner or later, depending on the circumstances, the hitherto unreckoned elements in our population are silently going to move the whole political situation on to higher ground and constitute politics a public service instead of a professional office-seeking game. The people were never more quietly thoughtful than now. Without bitterness, without impatience, with a splendid instructive confidence in their own ability to inject vitality into a torpid situation, they are taking cognizance of many public matters, and when they decide to speak, the powers that be will be shaken and the public conscience revived.

Pay for Your Children's Sunday Schooling!

Secular Instruction Charges Cheerfully Met, Why Not the Religious?

By DR. CHARLES M. SHELDON

The writer of this article has the distinction of being the author of a book of which 22,000,000 copies have been sold. It is the well-known volume, "In His Steps."

ACCORDING to the United States church census there are more than 26,000,000 church members in this republic. Out of that number there are in attendance on what is generally called the Sunday schools of the churches about 10,000,000 children.

The avowed purpose of these Sunday or Bible schools is to give these children a knowledge of Bible history and teaching, and to educate the heart and mind in religious thinking and conduct.

Here are a few important facts.

The Sunday school is a church institution, carried on by volunteer service of the members, and giving all its instruction free.

It is taught by men and women who give their services without any thought of compensation. Many of them are persons of great ability as teachers who spend hours of valuable time every week to prepare themselves to teach the most important themes of religion and conduct.

The church Sunday school costs the organization a nominal sum, paid out of the pledges of the church members. None of it is compulsory, and all of it is an exceedingly small amount compared with the importance of the subjects taught and compared with expenditures for other church purposes.

The time for the Sunday school is generally limited to one hour on Sunday, and the time given the teacher for teaching religion and conduct is ordinarily limited to three-quarters of an hour at most.

In the Average Home

THE children of the Sunday schools of this country receive the larger part of all their instruction in the Bible and in religious subjects from these schools. This statement is based on a questionnaire sent out to ascertain how many families taught their children out of the Bible at home. The number that did so with any regularity was negligible. The family altar and family study of the Bible have almost passed out of the American home life, and the church is supposed to give nearly all the religious training that American children get.

Push these statements to conclusions and we find something like this:

The average American family is receiving tremendously important education for practically nothing. If religious education is necessary, as Washington and Lincoln claimed repeatedly, for the welfare of the republic, then the Bible schools of this country, carried on by all the churches, are a greater factor than all the curricula of the colleges and universities.

And yet, in face of this fact, the American citizen who wants his children to go to Sunday school, even if he himself does not go, has apparently never thought of the immense debt he owes the church for giving his children fundamental instruction and doing it without any real expense on his part.

How about that, Mr. American Citizen? What do you think of having given to your children free, year after year, an education in subjects that Americans like Washington and Lincoln said were more important than any other? Of course you say you do help support the Sunday school with your church pledge, but the average church pledge of the average American citizen who belongs to a church would not pay the expenses of one of his boys or girls in a high school for a single month.

All of which recalls the incident in the life of an unusually intelligent and courageous minister who had a church in the Middle West of a thousand members. It was located in a college district of a town that boasted of its college-bred citizenship.

He chose an ideal family in his own parish: a man, his wife and five children, two boys and three girls. At the time this incident occurred, one of the boys was attending an eastern college; the other was in a college at home, two girls were in the high school and the youngest was in the grades.

Try This Cross-Questioning

THE man was a well-to-do merchant, and he and his wife were active workers in the church. All the children had been members of the Sunday school, entering it in the cradle roll and continuing into the upper departments. The minister was on intimate terms with his parishioner and did not hesitate to ask him the following pointed questions:

"How much does it cost you to send your boy through college down East?"

"About $2,000 a year."

"And the boy here at home?"

"About $500, counting his fraternity and other expenses."

"And what would you say the expenses of the girls in the high school were?"

"Well, counting books, parties, and incidentals, about $100 each."

"And the girl in the grades?"

"Counting only books and absolute expenses for a year, not over $25."

"Then on your own showing it costs you annually to educate your five children in secular knowledge $2,725."

"Call it $3,000 and you won't be missing it much. Of course, the college bills are pretty high, but I don't begrudge that. I never had a college education and I am glad the boys can get it."

"During all these years your five children have been members of the Sunday school, getting religious education. Can you give me an estimate as to the expense of this religious education, say for five years?"

In reply to this question, the well-to-do American citizen, who had been answering glibly, paused and stared at his pastor in astonishment. And before he could get his breath, the minister said:

"How much religious education do you give your children at home?"

"To tell the truth, not much. I'm too busy making a living. We gave up family prayers long ago. I see your point, pastor. My wife used to pray with the children at night when they were little, but the Sunday school has given our children practically all the religious education they ever had."

"And what did you say it cost?" persisted the minister.

"Well, I give the church $100 a year. I suppose some of that goes into the Sunday school."

"About one twentieth."

"Then it has cost me $5 a year to give all my children their religious education," said the well-to-do American citizen who was frank enough and keen enough to see the point.

"And, also, during at least five years, three of your children had for teachers three of the finest college professors we have, who gave their services during all that time without charging a cent for exceedingly valuable time and thought. Of course, you repaid some of that by thanking them and sending them good handsome checks at Christmas time."

"I'm sorry to say I never thought to thank them once. Who ever heard of parents thanking Sunday school teachers for what they have done for their children?"

"And yet the religious instruction of your children must be worth as much to them as the secular?"

"Let me think that over," said the well-to-do American citizen. "First time I ever gave the matter any real thought. I need to figure out what I owe our Sunday school."

And if this intelligent citizen figures it out at compound interest he will find that he owes the Sunday school something more than $3,000 a year to square his honest debt to that school.

This may seem very fantastic and even ridiculous to the hard-headed business man and the well-to-do American citizen whose children attend Sunday school. But if it is ridiculous, then religion is ridiculous and ethics and conduct as taught in most Sunday schools are worth less than science, art and mathematics.

Work Under Heavy Handicap

AS A matter of cold fact, the average American citizen who belongs to a church and gives $100 a year to its support and thinks he does mighty well, although he spends $500 on a golf club and a great deal more for theaters and baseball, has never really valued religion as worth paying for. Perhaps that is putting it a little strong. It might be more fair to say the habit of the church, established by long custom of giving religious instruction free, has cheapened it in the eyes of the American citizen, and if he had to pay a good tuition for it, as he is obliged to pay the college, it might assume in his thought the value which it really has. The Sunday schools of America are doing a most wonderful work, but they are doing it under a tremendous handicap. Think of a university or college, where the burden of teaching centers about science and literature and history and engineering, trying to carry on a tremendous program with an endowment of $500 a year, which is far more than a majority of Sunday schools have for their entire equipment annually.

Imagine the colleges trying to give secular education in the confused, inadequate schoolroom conditions that most churches face, in buildings that have not been constructed for teaching purposes. Imagine the secular education of American youth facing conditions similar to those which confront the church every week, where a most heroic struggle is going on without any support worth mentioning from the very parents of children who repudiate any obligations to support the only institution in the world that goes on, year after year, with pitiful lack of material and equipment, training heart and mind in subjects that are far more important than any of the subjects taught in colleges which are endowed with millions and equipped with the best and most modern material.

Here is what the American citizen who is a member of a church ought to do, if religion is really worth more than mathematics and art.

Need Right Type of Building

HE OUGHT to pay enough into the church treasury to enable the church, first of all, to construct a modern building adapted to teaching boys and girls, and as well equipped with material as a modern high school. The churches, with a few notable exceptions, are not constructed for teaching purposes. If the men in the churches, who are spending hundreds of thousands of dollars to send their children to expensive colleges East and West, would be willing to spend even a small percent of the cost of secular education on religious education, modern religious education buildings costing $100,000 apiece could be built for every church in America, and equipped with all the wonderful material which the church has at her hand, but is unable to buy on account of the expense, and the failure of its members to recognize its value to their children.

Motion pictures, illustrating the heroism of missionaries; illustrated lectures by Christian physicians on sex questions, given by men and women doctors; object lessons gleaned from Bible lands to interest and inspire large classes of boys of the age when large numbers of them leave the church because of the dullness of the pedagogic teaching; pictures, not motion, but works of art, that illustrate history and Bible times; music that would include instruments beyond the reach of the average church; these and a multitude of other things in the way of equipment would make of the Sunday schools of America an entirely new power in the lives of the young, and ring in a new order of things for the dignity and power of religion. As it is now, the boy and girl go to the church Sunday school and sit in a class, in most cases in a large room or in the church worship room itself, surrounded by other classes, in a babel of noises which is not far removed from the "blab" schools that used to be found in the South, with a multitude of distractions to try the genius and patience of the most consecrated teacher. The next day this boy and girl walk into a high school classroom where the class meets by itself, removed from all distracting noises, with pictures on the walls, with works of art to fill eye and memory, with every necessary equipment to make learning interesting and worth while. Is it any wonder, Mr. American Citizen, that your boy or girl looks upon the Sunday school with more or less amusement or even contempt when the comparison is made between it and the high school? And is it any wonder that, as a consequence, religion suffers in the judgment of your boy or girl if he ever wonders why, if religion is so necessary as Washington and Lincoln and you yourself say, the church does not have as good a place to teach it as the state has to teach zoology and algebra?

Are You Going to Pay?

THE church in America has an institution well organized, magnificently manned by an heroic teaching force, with all the potentiality of a unique influence to mold and shape the thinking and acting of millions of impressionable youths at the most critical age. But it is choked and hobbled and bound and gagged by its friends, the church members, because they have never had any vision of the real value of it, and have not been willing to pay the decent price for an invaluable training.

What do you say, Mr. American Citizen, church member? Are you going to be willing to pay something for your religion? At least a small percent of what you pay for secular? Is it worth more to you to have your son graduate in astronomy than to know something about the God who made astronomy possible? Is it worth more to your children to know how to talk foreign languages than to speak the language of the Brotherhood of Man? And what shall it profit you or them if, after finding the things in college books that tell them how to get on in this world, they miss the way to heaven and lose their own souls?

Is religious education worth more than secular?

If so, why don't we pay for it?

If the Sunday schools of America constitute the greatest educational force we have, why don't we support them as we support universities and colleges?

The Sunday Schools of America

Enrollment in the Sunday schools of the United States according to the report of the International Sunday School Association in 1918:

Teachers	1,583,491
Pupils	16,131,733
Total in U. S.	17,715,224
Enrollment in Canada:	
Teachers	94,204
Pupils	945,913
Total	1,040,117
Enrollment in Central America:	
Teachers	11,355
Pupils	155,912
Total	167,267
Enrollment in Negro Sunday schools:	
Teachers	178,945
Pupils	1,493,936
Total	1,672,881
Grand Total for North America:	
Teachers	1,867,995
Pupils	18,727,494
Total	20,595,489

The grand total reported for 1914 was 18,441,036.

Financing a Nation With Its Postage Stamps

Shrewd Governments Tax Hobby-riders of Other Countries for Revenue

Above, left and right—Picture stamps of French Colonies. Center two—Show surcharging of Latvian stamps caused by fall in exchange. Below—Fifty-mark Polish stamp of recent issue.

By ROLAND D. JOHNSON

Reproduction of the stamps on this page is for educational purposes.

POSTAGE stamps are an example of what might properly be called "service money," as contrasted with metal money or money representative of metal money. Every postage stamp printed is a promise on the part of the government to render a service corresponding to its face value and the established postal rates, and the government must expect, or at least stand ready to render that service, else the stamps are but mere labels.

In Europe and in some other parts of the world postage stamps are lawful money to a greater extent than in the United States. They are not only receivable in payment for postage, but are accepted for money orders. In China, Czecho-Slovakia and Austria, stamps are stuck on a money order to the face value of the order. And now in Europe stamps have become the means of financing bankrupt nations.

Upon the collecting of stamps as a hobby by millions of persons hangs the financial solvency of more than one government. The stamp-issuing world has grown rapidly, and there are merchants who make it their sole business to sell used and unused postage stamps, albums and other supplies to collectors. Many collectors find the field too large and limit themselves to certain countries but this has not lessened the market for postage stamps of all countries. Most collectors prefer unused stamps, for, of course, they are more attractive without the cancellation. More than that, attractive designs appeal more than ugly ones and bright colors are preferred over dull hues. Because of this postage stamps have become attractive.

This increase in numbers of stamp collectors as well as their greater interest soon was seized upon by the astute men in charge of the finances of certain nations. They realized that if a postage stamp is mounted in a collector's album, without ever having been used for postage, the government is financially the gainer. How natural then to make attractive stamps and to facilitate their sale to dealers who buy them to retail to collectors? Thus many nations specialize on "picture" stamps.

Czecho - Slovakian stamp bearing portrait of President Masaryk.

The British North Borneo Company, of North Borneo, makes a contract with any dealer wishing to buy stamps in large amounts, under the terms of which the North Borneo government sells stamps to the dealers neatly canceled "to order" (to prevent their use for postage) at a discount, and uncanceled stamps at a smaller discount. Since 1893 almost all North Borneo stamps have been "picture stamps" in two colors. The practice pays. The various denominations of the 1909 issue bears such subjects as a tapir, a tropical tree, a Borneo railroad station, an indoor scene, an elephant, a rhinoceros, a Bornese farmer plowing with an ox and wooden plow, a wild boar, a wild buffalo, and three kinds of tropical birds.

Liberia manufactures picture stamps extensively. The sale of stamps is declared to be the principal source of revenue to the government of the African commonwealth. Pictorial issues began in 1892 and have continued to date. *Scott's Monthly Journal* for March having just appeared with the announcement of a new issue ranging from one cent to five dollars. Trees, fish, birds, Liberian presidents, flowers, Liberian coins, landscapes, boats, monkeys, hippopotami, elephants, lizards, snakes, antelopes and crocodiles make an interesting picture gallery.

Newfoundland has been in the picture-stamp business since 1866, but has been discreet. Two issues, those of 1897 and 1910, commemorated historical events, the discovery and the colonization of the island. In 1911 the coronation of George V furnished a legitimate reason for a new issue. Beginning with Queen Mary on the one cent, there is King George on the two cent, the Prince of Wales on the three cent, Prince Albert on the four cent, Princess Mary on the five cent, Prince Henry on the six cent, Prince George on the eight cent and Prince John on the nine cent. By this time the stork had gone on a vacation, and Grandma Alexandra had to fill the 10 cent, and in default of relatives, the governor general and the coat of arms were used for the two remaining denominations.

While many governments, such as Abyssinia, Nyassa, Belgian Congo, and certain Latin-American countries, have from time to time resorted to what has been aptly termed, "Philatelic Financing," up to the time of the Great War, France perhaps was the most thoroughgoing exploiter of the picture stamp, as she continues to be. France has numerous colonies as well as post offices in China, Egypt, Crete and elsewhere, and each one, be it the vast Somali Coast region, or the tiny islands of Wallis and Futuna, must have a separate and distinct issue, almost without exception pictorial and in face value from one centime to five francs. There is not even the excuse for different issues which exists in the British Empire—the fact that different monetary systems are in use in different colonies—for all the French colonies use the centimes and francs of the mother country except Indo-China which uses the Chinese dollar and cent. France sells the stamps at the colonial office in Paris to save the French dealers the trouble of importing them from the colonies. These reconstruction days brought philatelic finance to its fullest development. The war saw great numbers of superfluous occupation stamps, provisional stamps, and stamps sold at an advance over face value in aid of some charity. There were separate Red Cross stamps for each French colony. The British North Borneo Company, for sweet charity's sake, in 1918 overprinted the whole current series RED CROSS, TWO CENTS, in two lines. There were 17 denominations ranging from one cent (Chinese) to $10. Thus for every set sold the British North Borneo Company received $19.66 Chinese, and the Red Cross received 34 cents Chinese. In the case of a similar set issued by Liberia in the same year and sold at the same advance over face value, the Liberian government received $10.33 and the Red Cross received 26 cents. The Liberian dollar is normally at par with the American dollar.

After the armistice, the atrocities really began. Nearly a dozen new governments, all far from solvent, issued too much paper money. For example, the German mark, although low, is as nothing compared to the Polish mark, so low that 50 are required for an ordinary single-weight letter from Poland to this country.

Postage stamp designs were made to attract, and printed in bright colors. Anything furnishes an excuse for a postal issue now. Poland, since 1918, has issued more than 280 different postage and postage-due stamps—more than this country issued in the first 50 years that it issued stamps! Esthonia, Czecho-Slovakia, Hungary, Latvia, Jugo-Slavia, Bulgaria, Fiume, Central Lithuania and others have also extended their currency in this manner which insures immediate retirement in large quantities—into stamp albums.

The fall in exchange has made this method of financing more successful. Stamps of new denominations meet the fall in value of the coinage. The first Polish issue started with a three-pfennig stamp and ended with one of five marks. The current issue begins with two marks and runs to fifty marks. These issues come to this country in enormous quantities. Some stamps are really being used, as the Hartford (Connecticut) *Times* recently indicated. A man in Hartford recently received a letter from his mother in the Ukraine. This letter bore more than its weight in postage, according to the account, for there were pasted to the back of the envelope, shingle fashion, so that all might be examined, six sheets of 25 stamps each, totaling 2,000 kopecks or 20 rubles in value, and each one canceled. The letter was smaller than the sheets, which had an appearance of a pad on a calendar. These were of the old stock of Czarist stamps which are being used up by the Soviet postal authorities.

Collectors are out of patience and in stampdom "Neuropeans" do not sell so well. This turning away from Europe has given the older hands at the stamp-issuing game a chance to make up for lost time. Within the last 12 months Nyassa, Liberia, and some of the South American countries have resumed work in the stamp printing office. Probably the newest entrant into the family of stamp-financed nations is the most conscienceless. In the last three years Japan has put out five special commemorative issues, occasioned by the treaty of peace, the first census, the dedication of the Meiji Shrine, the fiftieth anniversary of the founding of the postal service, and the return of the crown prince, respectively. In more than one of these instances, the government has allowed the Japanese stamp dealers to corner one value in the series, that they might make a handsome profit on the rise in price. In the cases of all these issues sales to the public were limited.

The Russian Soviet government has been the only non-offender in the line of postal issues, for from the fall of the Kerensky government to the last of last year, when postal communications were resumed with the rest of the world, no stamps were issued, letters being sent on the public frank, and paid for in the regular taxes.

The rapid increase in the number of varieties of postage stamps throughout the world is likely to kill the goose that lays the golden egg of stamp revenues. There is no industry that can stand over-production, least of all one which, like the stamp-saving business, relies for its success on the rarity of its products. Stamp collectors will not bear indefinitely the imposition of paying for new stamps, turned out as rapidly as engraving machinery can operate. It is well within the probabilities that stamp collectors will soon be forced by financial costs practically to boycott the flood of new issues and confine their savings to rare old ones which have the grace of having been issued purely for postage purposes.

Hungarian issue put out during Communist control of country.

The very abundance of the issues of paper money in European countries has made it of comparatively little value. It stands to reason that the great abundance of the stamp issues will have a similar effect on the demand for them.

The stamp-saving hobby, while it numbers among its devotees a few very wealthy persons willing to spend liberally and to go to almost any lengths to obtain specimens of all issues, still relies chiefly for its support on the enthusiastic amateur, especially the youthful amateur. Spending money is not so plentiful that the ordinary youth may lavish large sums on the collection of hundreds upon hundreds of new stamp issues. It is, therefore, probable that the continuance of these stamp issues "for revenue only" will have a discouraging effect on the amateur philatelist, confronted with the great obstacles to a complete collection.

Left to right—Belgian occupation stamp issued by Germans; stamp from San Marino, smallest stamp-issuing country in world; next four are from countries that specialize in picture issues; extreme right—French Colonial Red Cross stamp.

Radio to Supplant Press That Exploits It?

Is Frankenstein Creature Likely to Crush Agencies Now Employing It?

NEARLY a million American homes now contain radio receiving apparatus. The sales are mounting into the thousands weekly.

As this is written, there are between 75 and 100 stations broadcasting news, story and song over the North American continent and its encircling seas.

Out on the plains the barbed-wire fence is functioning as an aerial and in the squirming slums the tenement clothesline now reaches out from the world of grime into the fairyland of talking electrons.

Newspaper publicity is responsible for most of this marvelous growth in the popular use of radio.

Not only have the newspapers turned over whole pages and sections to the promotion of radio and assigned some of their brightest men to the story, but the billboards and their delivery trucks blaze with posters advertising their radio features and soliciting the support of the fast-growing army of radio fans.

Are they flirting with Nemesis, or have they helped to fashion a Frankenstein creature which will strangle them to death in its myriad coils and antennae?

Long ago the printed page stilled the town crier, but today his voice is filling the heavens and swelling over the seven seas. It takes no very nimble wit to foresee that radio—plaything of today—may possibly tomorrow result in as great a revolution in the communication of news and ideas as did the invention of printing.

For centuries the ear has played a secondary rôle in transmitting thought from man to man, and from generation to generation. The eye with the aid of the printed page, supplanted it in all but the more elemental things of life. With radio the ear comes back. Human speech, touched with the wand of radio, is freed from its space fetters and finds a world audience.

The "Plot" Idea Exploded

IF THERE comes a combat between the new and old system of transmitting thought it will present a spectacle somewhat similar to those primeval struggles between the huge Saurian reptiles and their more agile antagonists which displaced them. As against the massive and complicated printing industry radio has all the advantages of mobility, speed and the divisibility and multiplicity of productive units. Modern industrialism has seen several such struggles. A classic instance is the capture of the short-haul passenger business from the steam railroads by the more flexible electric interurbans, which are now sore beset by the still more elastic auto bus and private automobile.

Nothing could better show the absurdity of the "conspiracy" theory of American journalism popularized by chronically irritated gentlemen like Mr. Upton Sinclair than the frenzy with which the newspapers are engaged in promoting the development of a rival system of news distribution. There are thousands of sincere people in America today who are convinced that newspaper publishers sit up all night conspiring to control or color the thought of the American people. It is marvelous how editors and publishers ever have time to get their papers out, in view of the immense amount of conspiring they are supposed to do. But, at the same time, we find them devoting millions of dollars' worth of space toward the promotion and popularization of a new system of transporting thought which may possibly put them out of business. Some of them are even furnishing free the news they gather at immense expense to broadcasting stations which can deliver it to their own possible readers hours before they can present it in their newspapers.

Contrast the generous enthusiasm of the newspapers in thus promoting this new business for the electrical equipment companies, with the more canny methods by which the interests controlling the old-line telephone and telegraph companies strangled the development of the rival automatic systems, until they gained control of them through years of financial suppression and political clubbing.

Funeral arrangements for the newspapers, however, are as yet premature. In discussing the handicaps under which they will suffer in combat with radio, if such a contest comes, it is well to take into account that they have already successfully survived similar menaces. There was a time when the telephone was believed to have possibilities inimical to them, and in a few scattered villages news distribution by telephone made some progress. The ticker also had possibilities and in the days when every saloon dispensed sporting news and market reports on a free ticker next to the free lunch counter the sale of sporting extras was thus curtailed.

Then came the movies. Hailed as a rival of the newspaper, the motion picture has become an ally, almost a slave. The movies helped put the saloons out of business, damaged the legitimate theater and the street carnival, but instead of hurting the newspapers they are contributing millions of new revenue to the publishing interests and are stimulating interest in subjects which the newspapers can deal with more in detail.

Radio Has the Advantage

THERE is this vital difference, however, between the motion picture and radio as competitors of the newspaper. In the presentation of spot news the picture is hopelessly outclassed by the newspaper's superior speed, whereas radio has all the advantages of speed over the newspaper. It is interesting to note right here that recent tendencies of the newspapers in the presentation of spot news have paved the way for radio to take their place. The newspapers have been devoting less and less space to straight news and making their news stories shorter and shorter. It is obvious that they are thus educating readers to demand the very sort of news presentation which radio is pre-eminently fitted to supply.

The tendency of the newspapers to emphasize feature stories, human interest yarns, pictures and comic strips is directly due to the movies. The movies have profoundly modified the newspapers and are dominating the news content of many of them, especially the afternoon press of the larger cities.

More and more the afternoon newspapers are becoming daily magazines with a few columns of straight news thrown in for good measure. They are displacing the magazines even in the fiction field.

The innovation of the tabloid illustrated newspaper, the most revolutionary development in the publishing field in the last few years, can be directly traced to the silver screen. There is an afternoon newspaper in St. Louis which not only found the way to promotion and pay through catering to the tastes of movie fans, but acknowledged its debt by proclaiming itself the movie newspaper of St. Louis.

At one time the motion picture actually threatened to raise the intelligence of the newspaper clientele and thus force an improvement in the newspapers. That tendency seems to have perished. The interests which have obtained control of the movies seem to have smothered it effectively and the present reaction of the movies on the newspapers is in the opposite direction. The exploitation of moron themes for mutts on the screen is proceeding step by step with the descent of the newspapers to lower standards of intelligence in their quest for mass circulation. They have taken the miraculous prosperity and growth of the movie industry as the true criterion of public taste and demand, and are conforming their standards to it.

It is here that radio, when it is perfected to permit of sufficient selection by the recipient of radio service, has its biggest opportunity to supplant the newspaper. There are apparently no limits to the quality or classes of information or entertainment that can be broadcasted by radio, as the possible number of wave lengths has no limit.

With the improvement of receiving apparatus, the time is not far distant when the owner of a radio set can pick out of the electric ripples just what he wants, and eliminate the rest. Contrast this with the position of the newspaper reader. He may select what he *reads* but *not* what he *pays for*.

This condition is the result of the economic fallacy under which the modern newspaper lives on its by-product, *advertising*.

It is unnecessary to discuss here the fact that the modern newspaper is a manufacturing industry, which manufactures *mass circulation* to sell advertising space as a by-product. More and more its original function as a distributor of news—for profit of course—has been subordinated to the creation of mass circulation to sell its advertising value.

That fundamental change in the newspaper industry has had far-reaching effects on its presentation of news—all of which tend to create an opening for radio or any other method of news distribution which will depend on the straight sale of news and permit the buyer to select the news or entertainment he wants, and to reject the other.

The tendency of the newspaper today has also been to increase overhead and production costs in order to obtain mass circulation. This has in turn diminished the value of the news distributed to any particular class of readers, because they are compelled to pay for the news which other classes of readers want, and to submit to a curtailment of the news or entertainment that they prefer.

Can Bring "Free Speech" Back

RADIO need be troubled by "none of these things." It need not enter into any entangling alliance with industries which depend on advertising for their success and upon which the newspapers in turn depend for revenue.

It need be burdened with none of the myriad political, racial or other "inhibitions" on the treatment of the news which play upon the newspaper, which must maintain quantity circulation. The problem of overhead with radio will always be slight in comparison to the newspaper, and its plant investment and production costs should be almost insignificant in comparison.

Radio can make free speech something more than a legal abstraction. In the domain of political or industrial debate it can make America or the world one vast town meeting. The only real democracy that ever existed was that of the New England town meeting or the American winners of the West.

Radio comes like a sharp sword to cut the complicated skeins and knots of industrial civilization that now hold men's minds apart. It brings back the possibility of men settling their problems by talking one to the other, with no intervening class of interpreters swayed by a special interest, to alter the current of their speech.

Any man with an idea, an announcement or a grievance may some day be able to rent the necessary wave length, buy the needed "juice" and "tell it to the world"—or at any rate to any part of the world that cares to hear it.

Soon they will be framing laws to "regulate" radio. They have been conversing about it down in Washington. So far the discussion has apparently been open and there have been few sinister signs.

There has been some very recent talk in newspaper circles about prohibiting advertising by radio. However, this is a trifling threat. Probably no greater boon could be conferred on the radio industry than to prohibit advertising. We have seen what advertising has done to the newspapers. If all the lawmakers do to radio is to prevent it from becoming an advertising medium, its future is safe.

(C) By Fred. H. Kiser, Kiser Studio, Portland, Oregon.
Along the sky-line trail in the Cascades there are numerous lakes. Crescent Lake is popular because of its easy access by auto from the east side of the mountains. It is six miles from the crest of the Cascades and about 35 miles north of Crater Lake. The fishing is splendid.

Boston Acquires Etchings of Louvre Jewels

Complete Collection of Jules Jacquemart in Museum of Fine Arts After Having Remained Undisturbed in Carton for 41 Years

By F. N. HOLLINGSWORTH

A PRACTICALLY complete collection of Jules Jacquemart, the great master of jewelry etching, together with a number of original drawings, has recently been acquired by the Boston Museum of Fine Arts. These etchings include artist's proofs of Jacquemart's unequaled set of 60 plates which represent the gems and jewels of the Louvre collection, the greatest treasures of the French nation.

Jacquemart, besides having been an exponent of that finished product of French civilization, a great art connoisseur, collector and writer, was also a master water-colorist, and, according to such a critic as Hamerton, "the most marvelous etcher of still life who ever lived in the world." Not only that, but he was a master etcher from great paintings, and left no less than 22 examples of this part of his work. What gives a special value to the present set of more than one thousand pieces in the Boston Museum, is that it comes directly from the artist's own portfolio.

When Jacquemart died in 1880, he bequeathed two sets to his friend, Louis Gonse, the art connoisseur, who had compiled an admirable catalog of his work. One set was immediately presented to the French nation and has been treasured in the Reserve of the Bibliotheque Nationale. The other remained in carton, undisturbed for 41 years, until it crossed the ocean to rest in the Boston Museum of Fine Arts. When Director Carrington, of the print department, learned that it could be purchased, he immediately cabled, without ever having seen the set, knowing its great value to art students as well as arts and crafts and designers of this country.

Jacquemart's career was short and brilliant. His was a life dedicated to beauty and to the work of teaching others how to understand and enjoy it. Himself the son of a noted art connoisseur, he was born among art treasures, and became an impeccable draughtsman and a master of etching. He is considered by critics to have carried the technique of that art to its limits.

In the heyday of the Second Empire, when a cultivated public was collecting, as no people had ever collected before, he was commissioned to reproduce no end of art treasures. His etched plates, appearing regularly in the *Gazette des Beaux Arts* and other publications, made such a sensation that they inspired other nations to follow suit. The result was a remarkable improvement in the general appreciation of arts and the art crafts. Jacquemart's art had the rare combination of manual skill and artistic perceptions.

His plates depicting antique jewelry with its infinite refinement of detail, sixteenth century bookbindings covered with most intricate decoration in gold, silver and colors, antique and Renaissance armor with plates full of gold arabesques set into ivory, must be seen and studied in order to understand how wonderfully beautiful still life can be, when etched by an artist who is a technician, a painter, a musician and a poet.

The wonder is how a human eye and a human hand could have executed such fine, such faithful detail as is shown in his plates, especially in his reproductions of finely chased and carved cups, goblets and crystal vases.

What is probably the magnum opus of the collection is the set of 60 plates of the Louvre collection. He spent four years at the work. Here are a number of national heirlooms of great historic interest, like the swords of Chilperic, Charlemagne, and Francis I, jewels of the eleventh century, antique porphyry vases mounted in the Middle Ages, crystal vases which belonged to Valois kings, the gifts of the city of Florence to Marie de Medici, sconces of cameos, agates and pearls, the clasp of the mantle of Saint Louis, the cup of Mithridates, and a score of rock-crystal cups, vases and goblets etched with an exquisite pictorial effect. One could hardly believe that the ever-changing play of light could be so pictured to the mind of the beholder.

To attempt to enumerate the treasures in the Louvre collection would take volumes for the jewels and artisan work alone. To describe them would require a set of books as large as the Encyclopedia Britannica. A catalog of the jewels in the Royal Museum of Antiquities was published in 1850, but many have been added since then, and this volume was a modest little book that only cursorily described the articles. These include gold and silver of pure Etruscan work, Greco-Etruscan and Roman work and pure Greek designs; diadems, crowns and crown jewels used at coronations; funeral diadems; infants' diadems; elaborate coiffure pins; eardrops and earrings; (literally by the hundreds). There are elaborate bobbins, sconces, bracelets, scarabs, fibules, rings of all kinds, of ancient Etruscan, Greek and Roman workmanship; there are ambers of splendid colorings, rare ivories elaborately carved, chains, swords and sword hilts, poniards and daggers, buckles and clasps, vases, cups and goblets in rock-crystal and porphyry and such an array as would bewilder anyone.

Designs to inspire the modern jeweler to enthusiasm and the value not a king's ransom, but a war indemnity!

One cannot begin to describe all of the pieces pictured by Jacquemart in his etchings. He himself did not attempt to depict all of them—only the most historic or the most artistic and the most exquisite of the many designs. Included in the most striking of these is the clasp from the mantle of Saint Louis, which is reproduced with this article. It is studded with rare gems all of great size and of the first water. Minuteness of detail is shown in the etching of this piece, as well as the cup of Sicilian jasper and the eagle vase of porphyry. To get the real amount in detail in some of these, they must be examined under a magnifying glass. How a person working without one could execute such fineness of lines, everyone of them true, and depict the high lights so faithfully, is almost beyond the comprehension even to an expert, to say nothing of the layman.

Likewise, with the gem-studded chalice, the inside of which represents fish swimming in a pool. And back of all this, which no doubt Jacquemart fully appreciated and perhaps was the inspiration for this great work of his, is the wonderful artisanship of those old designers and craftsmen—all hand work. No machine grinding or polishing or tooling or buffing. And the tools were not the fine tools of today. Nor did they have the knowledge of chemistry to help them. They had secrets of their own, though, which modern craftsmen would give a great deal to know.

Then, too, there are etchings of an eagle vase of porphyry and a rock-crystal goblet which must have taken months of patient work. The eagle vase is unique. Probably no other like it exists outside of the Louvre. The goblet is graceful and well proportioned, though of heavy material. Around the base is a floral design, carved out, with the foot of the goblet hollow underneath. A foliage design runs around the stem, and just above this a beading. Another conventionalized flower design is on the bowl support at the top of the stem, while on each side of this support are two queer fish, perfect in detail. The whole piece is carved out of one piece of rock-crystal.

Around the outer edge of the chalice is a cutout block design and around the rim a foliate design set with gems. The leaves themselves are forms of gems inlaid in gold. In some instances, evidently, the gems have been lost from their settings that form the leaves, and this the artist has faithfully shown in each case. All the major gems are in their settings, however.

The rock-crystal vase is of the sixteenth century, in the reign of Francis I. Some of the other crystal vases of this period are carved with the mythological figures that the painters and sculptors of Fontainebleau introduced into France at that time.

And so one might go on. It will well repay any jeweler or designer to visit the Art Museum and examine this collection. Sketching from the designs is permitted.

Photographs of etchings in the Louvre collection of Jules Jacquemart.

The etching in the center is of the sword of Francis I; great minuteness of detail characterizes the reproduction of a clasp from the mantle of Saint Louis, shown in the lower left-hand corner; the etching in the lower right-hand corner is of a gem-studded chalice, with fish depicted swimming in a pool.

The Most Photographed Man in the United States

Crew of Camera Men Attached to White House Finds President Considerate of Their Requests

By GEORGE H. DACY

At left—President Harding tries his hand at operating a "movie" camera. The President has a good general knowledge of photography.

The first of the two photographs reproduced here is the first informal picture of a U. S. Cabinet ever made on the White House lawn. It also is the most popular picture of a Cabinet ever published. This shows the picture as the public saw it. In the oval is the picture as the photographers saw it while making the exposure.

As the public sees the picture and as it looks when snapped. Miss Mary Eaton, an actress, is shown here pinning an award on Mr. Tumulty's lapel. Mr. Tumulty will be remembered as President Wilson's secretary.

IT IS an ordeal for most of us to face the camera to have our pictures taken once in a decade. It is as hard for us to "look natural and pleasant" at the critical moment when the shutter pops open as it is for the defeated candidate to congratulate the victor after a heated political campaign.

How would you feel at the end of the day if your picture had been taken as many times as is President Warren G. Harding's? Did you ever see a photograph of our President with any but a pleasant, friendly expression on his face? Such a photograph has never been taken. In all the thousands of negatives made of President Harding, there is not one where he is pictured as frowning or looking displeased. And he is just the man he looks in his pictures—sincere, sympathetic, simple and democratic in his tastes, whole-souled, conscientious and conservative.

President Harding does not like to have his picture taken any better than do you or I, but he submits to it because newspaper and magazine readers the world over want to see photographs of the President of the United States and he considers it his duty to appear before the camera at frequent intervals. The majority of the 110,000,000 residents of the United States know President Harding only by his photographs. That they are keenly interested in the pictures of the President has been demonstrated repeatedly by surveys made by news and syndicate associations to test the popularity of the photographs of our Chief Executive.

Washington is the news center of the world and the capital city is the rendezvous for conventions, conclaves, conferences, congresses and other demonstration meetings of every sort and description. Just a few weeks ago, the Daughters of the American Revolution—several thousand strong—held their annual gathering in the City of Presidents. As this article was written, more than 5,000 in the motion picture world were assembled at Washington. During May and June and September and October, Washington is the mecca of many such gatherings. All these delegations visit the White House to pay their respects to the President. Invariably, they ask him to appear with them in a large group photograph. President Harding has been most courteous and kind in assenting to these requests and his pictures adorn the homes of thousands of Americans who have visited Washington during his administration and had their pictures taken in a group with the President.

The White House Photographer's Association is made up of 24 camera men who represent every news service, syndicate and newspaper in the world. Each photographer carries a membership card signed by George Christian, the President's secretary. This card is an identification which admits the bearer to public and private gatherings where the President is to appear. The card is of value to new photographers who are enrolled in the White House Photographer's Association before they get to know all the secret service men who generally accompany the President. Out-of-town photographers who come to Washington to take pictures of the President make their arrangements through the director of the association, A. W. Leonard. A special room in the White House executive offices is maintained for the use of the newspaper men and their photographers. Early each day a bulletin is posted at the door

The White House photographers. They are all ready to start out on a trip with the President.

Photos furnished by National Photo Co.

Every delegation that visits Washington naturally goes to the White House to pay its respects to the President, and President Harding is particularly obliging, much more so than predecessors who might be named. So it comes about that the House camera crew is kept busily engaged.

In the photo at the top of the page the picture of the picture-takers has been taken—the photograph the public never sees. In the oval is the conventional White House group picture.

of this press office giving the calendar, schedule and engagements of the President for the day. All the White House photographers stop off to read this bulletin the first thing in the morning. Then they plan their other engagements so that they will be back at the White House to get pictures of the President welcoming any distinguished visitor or official, or to accompany the Chief Executive on some trip or visit that he is to make. Did you ever try to visualize the picture behind the p i c t u r e when you looked at a photograph of the President or his Cabinet or a leading member of Congress? The view which the camera men have of the picture as it is being taken is quite different from the picture which the readers of the newspapers and magazines see as the picture is published. For example, after the first meeting of his Cabinet, President Harding invited the members out on the South Portico or back lawn of the White House where an informal picture of the Cabinet and President was made. This has been a most popular picture. The readers see only the Cabinet members sitting in an informal group. The camera operators as they took the picture could look about and see a dozen or more newspaper cameras of all types, sizes and descriptions pointed at the Federal officials. They also could s e e t h e pedestrians walking along the neighboring drives and boulevards and the motor cars that went chuggingly along unaware that one of the most remarkable photographs in Cabinet annals was being made inside the White House grounds.

When you see a picture of the President or one of his Cabinet members, showing him strolling unconcernedly along the street or alighting from an automobile, you may think that the picture was just a snapshot and chance luck. You may imagine that the photographer just happened to come along at the right moment. For the most part a picture of that description is staged and posed. The President or Senator, or general, or whoever it may be, acts as naturally as possible before the cameras. The secret of success of such pictures is to get a good one the first time. When the person being photographed has to repeat his movements a number of times, he loses his naturalness and the picture looks artificial and posed. The President frequently says to the White House photographers, "Boys, take me looking natural, don't ask me to pose."

Score in White House Crew

GENERALLY speaking, there are 15 or 20 of the White House photographers—they have no connection with the White House other than that they are deputized by their different employers and commercial agencies to take pictures of the President and other notables who visit the White House—who take pictures of the President when he attends important conferences, entertainments or other meetings. For example, one Saturday, recently, the American Legion staged one of the largest athletic meets ever held in the District of Columbia. The President attended. Fifteen photographers took pictures of him. Altogether about 100 different negatives were exposed. Subsequently, the best of these pictures were circulated by the various news services to all parts of the world. This was the first time in about three weeks that the President had had his picture taken. Ordinarily, however, some event or other comes up which makes it imperative for the President to stop within the scope of the camera's lens several times a week.

During the Harding Administration, the photographers have enjoyed more privileges at the White House than ever before but they have avoided any abuse of these additional courtesies. They appreciate the splendid cordiality and co-operation which President Harding accords them. Irrespective of their political affiliations, to a man, they are heart and soul behind Warren G. Harding. They speak of him as you would speak about a very dear friend. This is because President Harding always fraternizes with them whenever his picture is to be taken. He has a very good general knowledge of photography. Often he makes suggestions regarding the light and shadows and the best settings for the pictures. His suggestions are always kindly; their purpose is to obtain the best conditions possible for picture-making.

Just after the war and during Mr. Wilson's illness, it was worse than the labors of Hercules to get a picture of the President. This was at a time when all newspapers were demanding new pictures of the President. The White House photographers were desperate. Repeatedly, they had snapped pictures of the President as he drove out of the White House gates but none of these pictures were ever published as they were not considered satisfactory. The camera men and "movie" operators for weeks at a time rented high-priced rooms in hotels along the routes which the President's car might follow on the chance that they might be able to snap satisfactory pictures. For three weeks, 16 expert camera men picketed the east gate of the White House but without avail. Two photographers hid in a load of hay which was hauled into the White House grounds for the use of the sheep then maintained there. These operators hoped to get close enough to take several pictures of the President. However, they were discovered and evicted by the secret service men before they were well inside the executive gates. Later on, when his physicians consented, ex-President Wilson posed.

It used to be difficult to obtain photographs of government officials and members of Congress. Many leaders were prejudiced against having their pictures published. The present administration has softened such antipathies. Notables who once frowned whenever they saw a news photographer's camera now smile and pose.

Getting Morgan's Photo

THE persistency of the White House camera men has aided markedly in bringing about this change. For example, J. P. Morgan was in town. A corps of White House photographers pursued him all morning trying to get pictures; by one artifice or another, he evaded them. Finally, they cornered him in the House Office Building. Photographers took up their stand at every exit with their cameras carefully focused and ready for exposure as soon as Mr. Morgan appeared. Then one of the extra camera men went into the building and snapped a picture of Mr. Morgan as he left the elevator. This provoked the financier and he rushed to the front entrance and demanded of the photographers, "Boys, when is this going to stop?"

"When you stop and permit us to take your picture," they replied.

Appreciating that he was caught, Mr. Morgan relaxed, smiled and posed. Recently, a government official refused absolutely to have his picture made by the White House camera experts. The photographers tried various expedients and ruses to obtain pictures of this official but without success. Ultimately, they decided that drastic action was necessary. They organized a novel firing squad of four camera men. These experts carefully adjusted their cameras for rapid-fire activities. Then they gathered in the anteroom adjoining the private office of the official in question. Unannounced and precipitately, they charged into his sanctum and before the astonished notable could sense what was going on, they obtained several photographs.

"Gentlemen, you win," he said. "While you are here, you had better make some more exposures and be sure to get good pictures."

The Kodak Fans Visit Harding

AMONG every delegation that visits the White House there are kodak fans whose keenest desire is to take a picture of the President. President Harding's kindness is illustrated by an incident that recently occurred. The President's picture was taken with a number of leading farmers and agricultural experts during an agricultural convention in Washington. Among the throng was a number of girls with cameras who were anxious to snap the President but who were afraid of offending him by such action. Turning to the White House photographers, President Harding said, "After you professionals get through with me, I want to let these amateurs (indicating the girls) have a chance." This simple favor pleased the excited girls as much as if the President had presented each of them with a new Easter bonnet.

A newspaper man, President Harding has done all in his power to aid the reporters and feature writers who work through the White House correspondent's office to obtain timely and interesting stories. He is a member of the National Press Club, the largest organization of its kind, whose 1,400 members at one time have been engaged in active journalism. The most intimate talk which President Harding has made since he entered the White House was delivered before 800 members of the National Press Club on the first anniversary of his inauguration. It was a heart-to-heart talk. The President told about the difficulties he had met and said that he had done his level best for the good of the country. He was accorded an ovation.

COLE L. BLEASE

"Coley Blaze" Is on the Stump and South Carolina's Happy

Political Foes in for Summer of Denouncing

By STILES MANNING SCRUGGS

AS THE boys up in the woolhat district would put it, "Coal Blaze's" hat is in the ring and all doubt about the gubernatorial campaign being a pink-tea affair in South Carolina this autumn has passed. As we write that the Honorable Cole Livingston Blease is again in the battle zone, with a third term in the governorship as his goal, the mauve syringa lends its fragance to the zephyrs of spring and the ringing intonations of the one-gallus voters of the commonwealth, who are for Blease first, last and all the time.

The Blease boom came up with the crocus, but it failed to pass out with the pussy willow. It hangs on like high taxes and red mud in the piedmont section, because Mr. Blease, known from the mountain tops of Dark Corners to the sands of the sea at Charleston, as "the stormy petrel of politics," never yet has shown the white feather. He is as fond of a political battle as a bulldog, and he never quits until his jaws are pried or his friends succeed in carrying him to higher channels.

When Mr. Blease, then serving his second term as governor, resigned that office in 1915, he had the stage set for him to step into the United States Senate, but it proved even for an expert politician and near-statesman, as he was at that time, a case of too many cooks spoiling the broth. And so, instead of going to the Senate, Mr. Blease resumed the practice of law in Columbia. In matters of criminal jurisprudence, there are few lawyers of the capital city who know the law as he knows it, and still fewer who can even approximately match his wits at the bar when it comes to wringing a verdict from a jury.

Mr. Blease began his political career, as far as state estimation is concerned, in 1896 when he became a presidential elector, but he had been a member of the South Carolina House of Representatives, and Speaker, pro tem, of that body from Newberry County, even before that campaign. As a presidential elector he soon won popularity on the stump. He has been in office most of the time since he was licensed to practice law, except during the last decade, having been mayor of his city, representative of his county and district, in the South Carolina House and Senate, and twice governor of the state. He is a candidate, he says, now, not because it will satisfy any personal ambition, but because his friends insist on his saving the state.

And when the picturesque individual whom the loyal Bleaseites refer to as Coal Blaze, or just plain "Coley," gets on the hustings, we are ready to inform the six or eight aspiring gentlemen who also have their hats in the gubernatorial ring, that they will know that they have been in a fight when the smokescreen lifts next November. For be it known that the Honorable Cole Livingston Blease is the equal of the late Representative (Private) John Allen, of Mississippi, when it comes to repartee, as witty as the eminent Senator John Sharp Williams in political story-telling and as vindictive as Thomas Brackett Reed ever was in debate.

With these splendid equipments on the stump, coupled with the fact that Mr. Blease knows the political history of practically every public man in South Carolina, he is well-nigh impregnable. And as he has announced that he will speak in every county in the commonwealth before the primaries close this year, the rank and file of the men voters are predicting a hot time in the old state this year. As far as the women voters are concerned, there is an element of doubt, but Mr. Blease says he calculates to get his share of that vote because he was a consistent opponent of woman suffrage, but a warm supporter of the law when the majority put it across.

The strength of Blease, by long odds the most talked-of man in South Carolina, and the causes of Bleaseism are results of the social and economic conditions of the state, and of the quaint manner the one political party, the Democratic, conducts its campaigns here. The primary is all-important. The general election is a mere form, since there is but one set of nominees. A rule of the party is that candidates shall make a tour of the state and speak once in every county. They generally travel en masse, adhering to a schedule arranged by the executive committee.

This round of speech-making and hand-shaking comes always in the summer months, when men's tempers are, at best, eccentric. But this is a slack time for farmers and South Carolina is an agricultural state. The county-to-county method is a decided advantage to the stump speaker, particularly since the campaigner can usually beat the metropolitan newspaper to the audience.

Then, too, in South Carolina, politics is more than politics. It is a recreation, a part of life, a thing in which the citizen at large has a big interest, a medium through which men express themselves. For this reason a political fight is usually as welcome in the rural districts of South Carolina as a genuine circus. Men gather at the county seats from villages and countrysides far away. Automobiles are parked with rare abandonment, but there are yet remaining in this state many buggies and farm wagons and they are in evidence at these political meetings. Another unusual feature of the South Carolina political gathering is that scores of Negroes are there, not that they expect to vote, but they want to hear the jokes that they feel sure they will hear from the candidates.

At some central place, a platform is erected and the candidates appear on it to tell the opening joke about themselves or their opponents, for the fortieth time. In past campaigns generally the opponents of Blease have spoken first. One after the other they have their say and then the time arrives for Mr. Blease to speak. Instantly there is a wave of animation. Any stranger could pick out Cole Blease from those who oppose him, for their faces are expectant. "Tell 'em about it, Coley," shouts a man out in the crowd, and instantly the Blease men, scattered widely all through the audience, shout back such enthusiastic answers as, "He'll tell 'em," and "Lawsy-massy, ain't he a man!"

Mr. Blease runs his fingers through his long bushy hair, takes a sip of water, smiles, as his fighting jawbone gets ready for action, and launches into his speech, with his sleeves rolled up and a dare for any contender plainly written on his banner. He denounces his enemies, either personal or political, lauds his friends, declares he has nothing to apologize for and never did and never will apologize and the cheers of his friends drown out the remainder of his battle-charge barrage.

Then Mr. Blease takes a fling at the "hostile press" and that generally includes all the larger newspapers of the state and the South, not to mention the nation at large. He attacks high taxes and those in office who impose them, gives his opinion of the creation of new offices to be filled with political Neposes, declares undying devotion to the laboring man's cause, and so on, until the driving, dynamic concluding rhetoric is again drowned out in the cheers of his friends. He knows the chords to play upon.

It would be a long story to continue this narrative to its logical conclusion. Mr. Blease is in a class by himself. He would have made good as an actor. He might have shone in the business world as a captain of industry, or possibly he could have been wearing the shoulder straps of a lieutenant general. He is versatile. There is no gainsaying that fact. But he chose the law and the political hustings for his very own and these mistresses have never found him a slacker. He is a spellbinder but he is not any more like the late Senator ("Pitchfork") Tillman than Senator Tillman was like the dignified and erudite General Wade Hampton.

The one thing that has caused the comeback of Mr. Blease in the political domain of South Carolina politics is the after-the-war reconstruction, incidental hard times, due to the cotton boll weevil, and high taxes. Mr. Blease is opposed to the hard times, the high taxes and the floods, of course, but so is most everybody else. Only Mr. Blease is smart enough to capitalize on those distressing conditions. The Coal Blaze announcement is causing South Carolina to wake up, take a drink, ask what o'clock, and show no evidence of drowsiness. And that is what makes the mare go in this former stronghold of revolt against what its citizenship considered wrong.

When Uncle Sam Raised Camels

AWAY back in 1856 your Uncle Sam set aside $30,000 to spend for raising camels! Yes, sir, he did. In those days the maps used to show the states of Kansas, Missouri and on to California as white and marked in the geographies in big letters, "The Great American Desert." Everybody thought of this country as barren and desolate and useless. Even the Congressmen believed this to be true, so they voted this money for the use of the army to get across this "desert" to the smiling shores of California.

A young man by the name of Jefferson Davis, who had a good imagination, first thought of the plan. He would have Uncle Sam use the camels in trade and to chase Indians. He planned to bring the camels from India and start a colony of them in Western Texas.

After telling Congress about the plan and receiving permission to spend the money, he sent Captain D. D. Porter to the Far East to buy the camels. Then the trouble began, for neither Davis nor Porter knew anything about these great ships of the desert. They sent along with Porter, Major H. C. Wayne, but it seems he knew little more of the animal. They inspected the zoos in England and in France to see just what camels looked like and to find out all about them.

On to Tunis, Wayne and Porter went and there they bought a camel to study it first hand. When the sultan heard about it he insisted on giving them two from his own herd and thus show his respect for America. When they took these specimens on board ship they found them to be mangy and diseased. They next investigated the Smyrna market and then went to Constantinople. Hearing there that the animals grew abundantly in Africa, they turned back there. But first they inspected the camels that were being used in the Crimean War, which was then in progress. These were the Bactrian style and were being used by the British Army.

The two American camel hunters thought the Bactrian body style of camel ideal. It was possessed of many refinements that seemed most essential. There were no extras to buy. It had two humps instead of one and that made a much easier riding chassis and better for baggage or freight. So, going back to Constantinople, they sold their Tunis camels for $44 and set sail for Alexandria.

But in Egypt they couldn't obtain permission from the viceroy to export more than two, although they wanted 20. Finally they got 10 on condition that they would not ask for more later.

From Egypt they went back to Smyrna and loaded up to capacity with Asiatic camels and set out for home with 33 of the tall, awkward creatures in tow. They found that they had paid on an average of about $75 for each animal. The ship landed them at Indianola on the Texas coast. About 60 miles from the city a camp was chosen. It was named Camp Verde, and it was and is the only camel camp that ever existed in these United States.

For some reason the camels all decided that they didn't want to live. Wayne and Porter had brought back two camel doctors and they used all their arts.

Wayne was fearful that they were dying from eating cactus, so he saw to it that there was no cactus to be found around there. Then the baled hay was suspected of being too rich. Six died before the summer was over.

Davis sent Porter back to Smyrna for another load. This time Porter brought 41, and they were added to those at Camp Verde. But at about this time politics changed at Washington and the new administration forgot all about the new camel camp and slowly the homesick creatures died.

However, other men tried the thing privately. A Mr. Walton, of California, offered to put a route in operation if the government would give him five sections of land. A Texas man tried it. A company was formed that brought the camels into Baltimore, and the company tried to drive them overland to the Great American Desert. But they died on the way.

What an interesting insight on the official and national conception of the geography of the continent! They believed that the great wheat-growing and rich corn states of today were a part of a great Sahara and they would need camels to cross it safely!

Floriculture a Profession That Is Fascinating

Growing Flowers for Commercial Market Requires Skill

By E. I. FARRINGTON

AT THE end of 15 years as a hard-working school teacher, Mr. C. S. Strout, of Biddeford, Maine, found himself with a growing family on his hands and $1,500 in debt. He then decided that material success did not lie in that direction. Casting about for a way to mend his fortunes, his thoughts kept reverting to a somewhat dilapidated poultry house in the back yard. It wasn't poultry he had in mind, however, but flowers.

In a few evenings' work he replaced the shingled roof with glass sash, using discarded double windows for the purpose. Inside the house he built a bench, which he covered with earth and planted to carnations, or pinks, as they were commonly called in those days. When the weather grew cold he set up a big lamp to keep the building warm. Occasionally, he spent most of the hours of darkness in the reconstructed poultry house, watching over his few dozen plants. Once he fought the elements all night to keep the house from being blown down or the glass broken in.

From such a humble beginning Mr. Strout has made himself one of America's biggest carnation growers. Just recently he finished a glass house 300 feet long, which cost him $40,000. And this is only one of many houses filled with pinks and roses. Of course, school teaching was dropped after a few years, Mr. Strout's whole time being given to acquiring a better knowledge of the flower business, a knowledge which has made him well-to-do.

Some 30 years ago J. K. Alexander was working at a bench in a Brockton, Massachusetts, shoe factory. In some way he acquired a dozen dahlia bulbs, which were planted in his front yard. His dahlias increased so rapidly that he was soon giving bulbs to all his friends and neighbors. It occurred to him to sell a few. The demand increased. Soon dahlias were planted all around the house, and required all his spare time. Then he left the shop, hired a field and staked his future on the dahlia. Now he has 40 or 50 acres on which nothing but dahlias are grown, and each fall he stores away more than a million tubers.

When B. Hammond Tracy was still a young man, his health broke down and he found himself relegated to a little farm on the north shore of Massachusetts, a farm which was believed to be worn-out and valueless, as far as the production of crops was concerned. Someone made him a present of a few gladiolus bulbs, which he stuck into the ground, with no particular interest. As these bulbs grew and blossomed, however, they suggested a possible future to Mr. Tracy. Born and bred in the city, he realized the demand for flowers grown outside of hothouses, and a little experimenting showed him that the soil of the old farm, while not adapted perhaps to the production of field crops, was just right for growing gladioli. On this foundation has been built a business which is known the country over. The old-fashioned farm house has been remodeled and refitted throughout. A splendid concrete storage cellar and display house has been erected, and in midsummer a sea of brilliant color stretches away almost as far as the eye can reach, hundreds of thousands of gladiolus spikes nodding their heads in undulating rows.

It was in an Indiana town that Mrs. Barbara Heller sowed the seeds of an industry which has assumed immense proportions. The roses of Newcastle are known the world over. But Mrs. Heller began to grow them in a little room no larger than a kitchenette. A son found a market for her. Another son became his mother's assistant in their production. Gradually the business expanded until Heller Brothers came to own 12 acres covered with glass. The number of roses grown in this one establishment may be judged from the fact that when the great tornado of 1917 swept over Indiana, five hundred thousand plants were destroyed in a single night.

It is in this way that many of the largest flower-producing establishments in the country had their beginnings. It indicates something of what the flower business offers as a life work. And yet it deals only with the growing end of the business.

The operation of a flower store is necessarily correlated closely with flower-growing, yet is a distinct branch of the industry. Some of the best-known retail establishments have had humble beginnings. There is no better known florist in the country than Henry Penn, of Boston. But Henry Penn began life as a newsboy. Later he began selling flowers in the most limited way. Then he bought a small store, studying business methods and the flower markets day and night. Now he has one of the finest stores in the East, and makes a handsome profit every year.

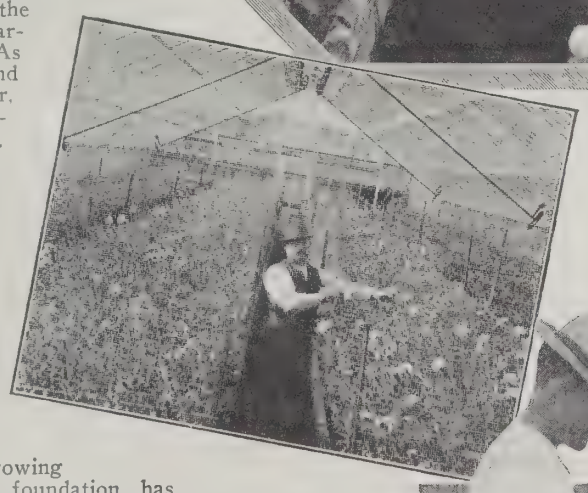
Max Schling, equally well known in New York, started with almost nothing, and owns today not only a magnificent flower establishment, but a seed business as well.

There is an intermediate branch of the business, which includes the selling of flowers at wholesale and on commission. Also there is the business of raising small plants to be sold in quantities to other florists. One woman has been especially successful along this line. Miss Gunterberg, of Chicago, is said to spend more money for advertising in the florist trade papers than any other member of the trade in the city, and her business has reached enormous proportions.

I might continue to give examples of florists who have made a signal success of their business, as a result of their own indefatigable labors and intelligent efforts. On the other hand, I might tell of many others who have become florists through inheritance. Probably there is no one line of business in which the sons follow in their fathers' footsteps to a greater extent. That in itself, I think, is one of the best tributes to the fascination of the flower-growing trade. There are examples without number where the business has been in one family for several generations. In innumerable instances fathers and sons, and sisters, mothers and daughters are working together.

The business of growing and selling flowers has been developed within the last half century. It has not yet entirely found itself, and much remains to be done to put it on a strictly economic basis. Formerly, a flower business could be carried on successfully without a very careful keeping of accounts, or an accurate study of cost systems. These days are passing. Competition is sharp and growing sharper. Many old-time florists have been crowded out, not because they were poor growers, but because they had not learned how to handle figures. Any young man who becomes a florist with the expectation of running his own establishment, whether as a grower or a retailer, must have a business head. On the other hand, there are plenty of opportunities for men who are capable of developing into first-class foremen or specialists, and who can make a good salary if they are willing to work for others.

A decision must be made at the beginning as to whether one prefers working in a store where he can wear a white shirt and keep his shoes polished, or in a greenhouse where he must necessarily wear old clothes and acquire plenty of soil under his finger nails. The retail store is the place for a man or a woman who likes to meet people, who is talkative, resourceful, untiring and energetic. Selling flowers is much like selling any other commodity, except that they are perishable, and if not disposed of immediately are wasted. This is the hazard of the retail flower business. Success or failure depends on one's ability to gauge the demand from day to day, and to find some way to use up most of the stock. Some flowers will have to be dumped, in any event, but the smaller the number, the greater the profits, or, it may be, the smaller the losses.



In many of the smaller cities and towns florists combine a greenhouse business with a retail store, producing a large proportion of the flowers they sell. This is a particularly good combination when there are partners, one of whom is a good grower and the other a live salesman. Men or women who have equal ability as growers and store managers are not easy to find. Sometimes, though, it is not necessary to have a store. Much retail business can often be done in a greenhouse, especially if located near a cemetery. The retail florists' business consists largely of the sale of flowers for funerals, which includes the making up of sprays, wreaths, crosses and the like. This is a branch of the business that requires no little artistic skill, and must be learned by long practice.

Generally speaking, there is a very large preponderance of foreign-born people in the ranks of the retail florists. Many Jews are very successful as florists. In New York City there is an army of Greek florists. It is entirely different in the growing end. The alien names found there are fewer, and are mostly Irish, Scotch and English, with an occasional German and Italian.

In the florist business, as in every other line, it is the exceptional man who makes a marked success. While an occasional florist develops unusual ability and acquires a fortune, the average man or woman must be satisfied with a fair living. It is a fact, though, that there are comparatively few failures among the growers, while many failures must be admitted in the retail end. One explanation lies in the fact that it is much easier to start a flower store than it is to establish a greenhouse business. Ninety per cent of the florists' investments throughout this country are in the greenhouse end. The hours in a greenhouse are long, but working conditions are much better than they were a few years ago, for the modern greenhouse is so constructed that the employes can move around in it without stooping or straddling pipes. Wages are much higher than they were before the war. Many foremen get from $30 to $40 a week.

Where a Capitol and a University Luxuriate

Madison, Lake-shrined City, Crowns Lake-filled State of Wisconsin; Streets Named After 39 Men Who Signed Declaration of Independence

By MARK G. TROXELL

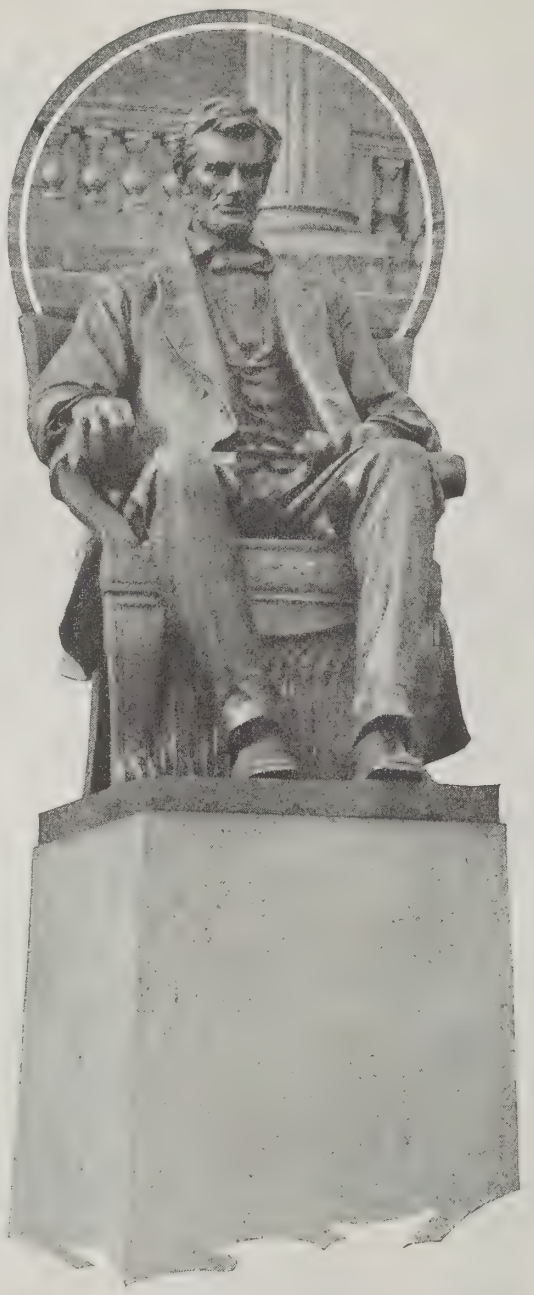
WHEN Black Hawk and his embittered Sauk warriors retreated, in 1832, across the high knoll where the University of Wisconsin now stands, he gazed on a spot destined to become the setting for a commonwealth's seat of government. While the captured brave was sullenly enduring a tour of the cities along the Atlantic seaboard, white men were planning a state's capital on the field where Black Hawk had met humiliation.

Even in a lake-dotted territory, the spot was unique. Two glorious, timber-rimmed lakes, the northernmost of a chain of four large sheets of water, were divided only by a high ridge. This rocky backbone of land was covered with groves of stately oak trees; fires had cleared away the underbrush, and a thick carpet of grass made the woods inviting. Rapidly, to east and west, the park-like character of the little forest disappeared in marshes and sluggish streams. A French halfbreed, Oliver Armel, had a trading shanty on the isthmus. There were no permanent dwellings.

Madison would not have become the capital of Wisconsin had not James Duane Doty, who in 1836 was United States circuit judge for the country west of Lake Michigan, been able to urge its setting and its geographic location, midway between the struggling lake ports and the rough mining region along the Mississippi, as ideal for the legislative home of a new and ambitious commonwealth. In the little hamlet of Belmont, in western Wisconsin, the first legislature for a month weighed the merits of 17 applicants for the territorial capital. Milwaukee, Racine, Green Bay, Portage, and others had actual settlements and immediate prospects about which to weave their claims. Madison, merely a tract of land owned by Doty and his friends, had only its beauty and its location to recommend it.

After hot debate and with many misgivings, the legislature voted to give Doty's site the prize. The august body was aided in its decision by promises of attractive town lots to members. The name Madison was selected by Doty and his partner, S. T. Mason, then governor of Michigan Territory, to honor the fourth President and his wife, Dolly Madison.

Doty was the only man at Belmont who knew much about the selected spot. He had suggested some rising ground near the middle of the isthmus as the approximate site of the capital. A surveyor was commissioned to lay out the streets. This man arrived in February, 1837, during a blinding snowstorm, and was glad to take refuge in the shack of the trader, Armel, until he could perform his duties.



Village Slow to Grow

WITH a poor instrument, half-trained chainmen, and difficult topography to deal with, the surveyor planned a city that took advantage of the isthmus to get the longest straight streets possible. Beginning at the corners of the capitol park, four blocks square, he planned radiating main thoroughfares that suggest Washington, D. C. These avenues followed the cardinal points of the compass. The cross-streets, from lake to lake, ran northwest and southeast, with long roads crossing them at right angles. The capitol park, fortunately, came on high ground almost midway between the two lakes, commanding both of them by wide avenues.

The early surveyor did more than lay out the Madison streets; he gave them their names. He thought it fitting to perpetuate the names of the signers of the United States Constitution. To his thoughtfulness, Madison owes the unique distinction of being the only city in the nation to possess principal streets named after most of the 39 men who dared to sign the document that bound the colonies together.

The street parallel to the northern shore the surveyor named Langdon, after the New Hampshire delegate who, with Nicholas Gilman, signed for his colony. The next street became Gilman; then Gorham and King, of Massachusetts, had streets named in their memory. The wide thoroughfare running parallel to the two lake shores, and midway between them, was named after George Washington, president of the convention. Alexander Hamilton, through his prominence as the only man from New York consenting to sign the document, was honored by having his name given to the single north-and-south highway in the main part of the town. Southern delegates, Spaight, Pinckney, Rutledge and Few, were remembered. Lastly, near the southern lake shore, a street was named Doty.

The village was slow of growth. The capitol was built by workmen who toiled for 10 days merely to get their tools and building materials through the woods and swamps between Milwaukee and Madison, a journey now accomplished by rail in three hours. In early days, the legislature met annually. Lawmakers, office seekers, and their friends taxed the housing resources to the limit. By 1842, the permanent population had reached only 172 persons. During that winter,

Lincoln statue on crest of University Hill, Madison, Wisconsin.

Assemblyman Arndt was killed on the floor of the council chamber by J. R. Vineyard, a fellow member.

After the visit of Horace Greeley and Bayard Taylor in 1855, these gifted writers revealed the beauties of the frontier town to eastern readers through the columns of the New York *Tribune*. "It has the most magnificent site of any inland city I ever saw," declared Greeley. Through this publicity, many easterners were brought to the struggling town.

Despite early hardships and transportation difficulties, Madison has grown to the fifth among Wisconsin cities. Its industries have kept pace with its growth, but first and last Madison remains remarkable for its public institutions. Most cities of the Middle West regard themselves as blessed if they can secure either the capitol or the university of a state. Madison was lucky in getting both.

The new Wisconsin capitol is the only domed building in this country built entirely of granite. It was the outgrowth of a disaster. On February 27, 1904, a destructive fire made a complete wreck of the old state house. Immediate action was imperative. Plans were drawn for a new capitol and construction was begun late in 1907. Work was continued for eight years. In 1917 the north wing was finished, completing the building.

Occupying a 15-acre park in the heart of the city, the Madison capitol has four wings that stretch toward the corners of the grounds. The barrel of the great dome is a circular Corinthian arcade. Three podium floors give the visitor to Madison a chance to view the lakes and hills of Dane County, as well as the city itself.

The dome is the wonder of the building. Rising 200 feet above the wings, it almost equals the national capitol in height, and surpasses it in grace and beauty. The exquisite lantern surmounting the dome upholds a gilded statue, "Forward," which faces toward Lake Monona and the east.

No detailed description can do justice to the white granite structure. To appreciate its beauty, one must have watched the first rays of a winter sun creep down from the lantern to the roofs of the wings, or glimpsed, from across the waters of Lake Monona, the sunset painting a background for the graying outline of the stately dome. No Madisonian on Christmas Eve would regard the night complete without the lights on the wings to throw into clear relief the snow-covered roof of the city's most prized possession. Returning across country on summer nights, motorists stop, awe-struck and silent, to gaze at the lighted dome from a hill 30 miles away.

The capitol shares honors, in Madison, with the University of Wisconsin, which is situated on a hill one mile west of the state house. Possessing an unrivaled location and high scholastic traditions, its attractions cannot be measured in architectural terms. Man and nature seem to have done most for the agricultural college, at the western end of the campus; but the real atmosphere of the school is felt most strongly near the great statue of Lincoln, in front of the main hall commanding the approach to "the hill."

Justly Famed as Resort

DR. RICHARD T. ELY, from Johns Hopkins University, transferred his works in economics to Wisconsin. He built up a department having international prestige. From around the world scores of ambitious young men today travel to study at an institution which has been honored in being served by one of America's foremost economists.

Other illustrious names could be mentioned. Who can estimate the value of Doctor Babcock's invention of the milk tester, which almost overnight changed dairying from the most haphazard to the most scientific of farm industries? To millions of hard-working people, the quiet work of the famous chemist has meant a chance for better living.

In history, literature, the sciences and the arts, the institution on Lake Mendota has been of great service to all mankind.

"Madison could be justly famed as a resort if it had no more serious and solid attractions," Carl Vrooman once remarked. Each summer and winter season makes the truth of his statement more apparent.

The Indians discovered that the four-lakes region abounds in game and fish. Early settlers could catch pike and pickerel from the city wharves, and shoot ducks and geese from the shores of the town. As the city grew, little trips by row boat were necessary to reach the game. Today a motor launch takes him who loves to cast, in 20 minutes' time, to "holes" where the bass and pike are known to "strike." Perch and bluegill "bars" are plentiful for the patient "still fisher." The man who likes duck shooting leaves town ere dawn of an autumn morning, and is in the blind when the sun rises and the water fowl begin to fly.

From New Year's to Thanksgiving, the university students join the townspeople in making Madison a resort. About mid-December, both lakes become ice-covered. Ice boat and horse races on the ice are attended by crowds.

Madison's population includes not only office-holding, degree-seeking and pleasure-loving classes. The city's industries are greater in a financial way, than university and capitol combined. Dane County, of which Madison is the county seat, ranks first in agricultural wealth of all counties in the Middle West. A vocational high school, just completed, offers practical courses to the children of men in industry and farm work.

Above the picture of the Wisconsin capitol, is a group of university students, taken on the ice. Students in "hiking" costumes on "Fraternity Row" are shown in the picture to the left of the capitol dome, while to the right is a fleet of ice boats on Lake Monona. The capitol, built of Bethel granite, occupies a 15-acre park.

Floriculture a Profession That Is Fascinating

Concluded from page 13

Three or four dollars a day is probably the average wage for experienced help.

The best way to learn the business is to go into a greenhouse where plants of many kinds are grown. Of course, if one proposes to specialize in the growing of roses or carnations, it is not necessary to become familiar with other kinds of stock. Three or four years of apprenticeship should give a young man sufficient knowledge and assurance to start in business for himself, but he should do this in a small way at first, and only after carefully studying his market. I am speaking now of greenhouse men. The growing of outside flowers, like dahlias and gladioli, requires a different kind of training. These plants are grown, not so much for their blooms as for their bulbs. It is easy to make a small beginning with bulbous stock with but little expense, and perhaps while continuing in another line of work.

The demand for gladioli and dahlias has increased with surprising rapidity within the past few years. There are now men and women in almost every town who are making a living or at least adding to their income from the sale of the flowers and the bulbs. To make a success with this work, however, it is necessary to have a good storage cellar, for otherwise there will be a heavy loss during the winter. Many people have also taken up the growing of peonies and irises, but it is necessary to wait longer for results. Peonies, in particular, increase slowly and several years must elapse before there will be any return from the initial investment.

It might be thought that there would be a good sale of ordinary garden flowers, but this is not true. Few flowers of this kind, apart from gladioli, peonies and larkspur, are seen in the stores. In fact, the handling of garden flowers is discouraged. City florists prefer to carry an established line of blooms from their regular growers rather than to receive outside consignments which are bound to be uneven in quantity and in quality and which would require the opening of many new and small accounts. On the other hand, local florists in the small towns will often buy garden flowers and such flowers can readily be sold at stands put up along well-traveled motor routes. Some florists who have greenhouses by the side of main highways are now growing outside flowers and selling them at the door to the automobile trade.

Years ago wide attention was attracted by the announcement that Thomas W. Lawson, the financier, had paid $30,000 for a carnation to bear his wife's name. The flower was exhibited in the window of a Boston florist and crowds flocked to see it. Soon the Lawson Pink was distributed throughout the country and greatly stimulated interest in carnations and carnation-growing. Now there are many florists who grow nothing but carnations. The Lawson Pink itself, however, is seldom seen. Newer and finer kinds have taken its place. At its best, the life of any carnation variety is seldom more than seven years. The most famous carnation of the present day is Laddie, beside which the Lawson would look like a pigmy.

Not a few florists have won fame and fortune by the development of new varieties. This is especially true as applied to carnations, but also holds good among the rose growers. Perfect roses for growing under glass have not yet been found, but constant improvements are being made and the man who originates a better variety than is already in commerce is sure to make money. Hybridization with this purpose in view is fascinating work and many florists give their attention to it.

When starting a greenhouse business it is important to have a location where shipping facilities are good. This does not necessarily mean near a large city, for many greenhouses are situated in small towns; but train service must be satisfactory or else there must be good automobile roads. Many flowers are shipped direct to the wholesale markets in the larger cities, afterward being distributed to the retailers. Chicago being one of the biggest flower centers in the world, it is surrounded by growers, which means sharp competition. Poehlman Brothers alone have more than 2,000,000 feet of glass. Flowers are shipped from Chicago as far as Jacksonville, Florida, and Denver, Colorado. The choicest flowers sold in the shops of New Orleans during the winter months come from Chicago.

Flower-growing under glass is done in a very intensive way and the work can be learned only at first hand. The returns from an acre under glass must run from $15,000 to $20,000 to make the investment profitable. Several of the agricultural colleges have courses in floriculture which are well attended. Even the sons of successful florists take these courses to get the theory of their work. Any such course, however, must be supplemented by actual employment in a commercial greenhouse. No boy can learn to be a florist in a college, although a college education is a distinct advantage.

Commercial flower-growing has many problems, but it is an unusually interesting line of work. It is more monotonous than might be expected, perhaps, and it is exacting. Yet never-ending fascination is found in the handling of flowers. Those who love them take the greatest delight in watching them grow, expand and unfold. Every group of flower growers has its organization. The members get together frequently to talk over matters connected with their trade, and the annual conventions of the florists are events looked forward to with the keenest interest.

BRIEFLY TOLD

Nearly half the 7,600,000 inhabitants of Belgium are savings-bank depositors. The depositors have an average credit of 427 francs.

Cities of the ancient Philistines are being excavated by a prominent British archeologist in the belief that many mysteries of this very old race will come to light. The cities of Ascalon and Gaza are now being worked and the "tells," or artificially formed hills near these cities, will undoubtedly reveal information as to the race history of the peoples who inhabited this district before Moses. For three thousand years nothing is known of the history of the Philistines. Ruins of Greek and Roman buildings, constructed at a later date, will have to be unearthed before reaching the cities of the Philistines.

Japan has a "Yellow Menace" as well as California and other Pacific coast states. During and after the war boom, Japanese employers imported coolies and operatives from Korea and China to work in their textile mills, mines and smelters. Now the native Japanese workers consider the presence of this alien labor a grievance and their attitude toward these invaders is the same as the attitude of white labor on the Pacific coast toward the Japanese. Because of the California question the Japanese find it difficult to handle this matter as the cases are considered identical.

The total mortgage debt on owned homes and farms in Indiana is $227,152,105. The total value of these mortgaged homes and farms is $760,128,279. The mortgage debt thus represents nearly 30 per cent of the total value. This is in accordance with the census of 1920.

Genoa was not happy over the great conference. It cost the city about $12,000,000 and Genoa had to borrow the money.

The town crier is not extinct. Chertsey, England, has a woman town crier who adds charm to the town by her picturesque presence. London in the old days had its crier who clanged a bell to arrest the attention of the public. The seaside towns of England in the old days had a crier who "cried" for lost children, watches and purses. Ramsay, the little town in the Isle of Man, still retains the crier as strong of voice and bell as ever.

Sheep came in for shearing from the ranges near Centralia, Washington, with a luxuriant growth of moss on their backs which prevented the fleece from being sold as the wool was not worth the expense of shearing. During the winter the flocks fed in the open country and the wool became drenched in the misty rains, and, mixed with the soil of the feeding pens, formed the basis for the formation of the fungus moss.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

Deer forests of Scotland provide wealthy owners with sport during a few weeks in the year. The greater part of this land could be profitably farmed. The total area of these forests is 3,432,385 acres. The slums of Edinburgh and Glasgow become more congested and the emigration lists from Scotland increase as the deer forests grow in extent.

India is the world's greatest opium producer and the sale of the product is a government monopoly.

The latest thing in counterfeits is a green diamond. The peculiar tint of the genuine gem is said to have been copied successfully by the use of radium, and large white stones of cheaper quality afford the material on which to work. Fortunately, the smaller gems do not allow enough profit to warrant treatment, and it is only the wealthy who can afford to buy those that are large enough.

Advertising signs in the national forests of California must come down. Advertisements printed on trees and rocks are also to be effaced. Such advertising is prohibited in all national forests without special permits, which are seldom issued. Unsightly signs and billboards deface the mountain landscapes of our national forests.

The city of Adelaide contains nearly 55 per cent of the population of South Australia, Melbourne nearly 50 per cent of that of Victoria, and Sydney 42 per cent of that of New South Wales.

The removal from the south of France of the famous fourteenth century Gothic ruin of the Oratory of Belle Croix, at Villeneuve, is being protested by French archeologists. The ruin consists of one pointed arch and a few scattered stones. It was purchased by an American antiquary in 1918 for a large sum.

The limequat is a new citrous fruit obtained by crossing the West India lime with the kumquat orange. The new hybrid possesses the hardy characteristics of the kumquat and is more disease resistant than the lime. The color is light yellow and the rind is edible.

The old home of Daniel Boone in Kentucky is falling to pieces. It has withstood the elements for nearly 200 years and is slowly falling to ruin from lack of care. One room contains a large fireplace of stones still in good condition. The doors and shutters of the dwelling are hung on wrought iron hinges, but many of the windows are broken, permitting snow and rain to enter and causing the floor to decay.

Pictures were flashed from Italian to American battleships by wireless recently in a test off the coast of Italy. The Italian navy has purchased the inventor's method and transmission apparatus and is planning to install machines on navy vessels.

A motorless flight tourney is planned in France for August 6 to 20. Americans and all citizens of the late allied or neutral countries are eligible to enter the tourney and compete for 100,000 francs in prizes. Ordinary entries will be received by the Francaise Aerienne Association of Paris until May 31, and extraordinary, until July 15.

The sweetening quality of dahlia roots is 60 per cent greater than the amount of sugar obtained from sugar cane, according to estimates. The root is not starchy like that of the potato, but is rich in sugar. Dahlias grow wild in Mexico and can be grown anywhere in the United States.

A motion picture city rivaling that of Los Angeles is being built near Nice, France. Practically everything used in the film production will be manufactured within the city gates. Workshops and studios, built to include the very latest devices for the making of a movie, are now nearing completion. The chief studio measures 500 feet in length. Other studios will be equipped with terraces and other features of old French architecture, thus adding to the romantic and beautiful atmosphere that will furnish the film drama background.

In the spring when icebergs come floating down from the glaciers of Greenland, coastguard service vessels of the American fleet go out in search of them. When a berg is found the vessels wireless its presence to the boats of all nations in the vicinity. The cost of the patrol is borne by all the maritime nations using the Atlantic in proportion to the number of ships sailing under their respective flags.

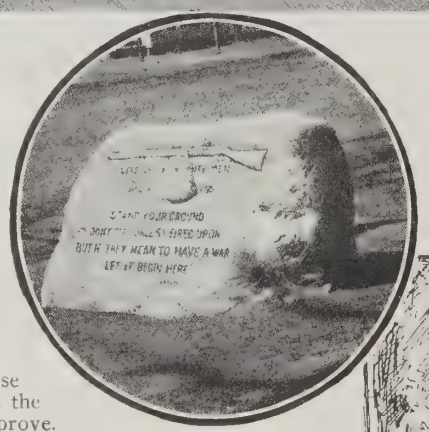
Lexington, Whose Villagers Did Not Disperse

Spacious Green's Century-old Trees Form Spot of Idyllic Beauty

By MAY B. WHITING



LEXINGTON is a peaceful village. The spacious Green is a spot of idyllic beauty with its avenues of century-old elm and ash. The simple monuments of granite add a touch of pathos and the old colonial houses that border it are an ideal setting to enhance its charm. In the stillness of a spring morning, with only the eerie notes of returning bluebird and meadow lark in the air, the picture is one of tranquil joy and repose. Yet on this same Green, not greatly changed in the past 150 years, the first rebel blood was shed.

Nowadays, in village planning, they mark off a "civic center," but the Commons, evolved by the necessities of life and the natural good taste of our forefathers, are finer than anything that the expert can accomplish. In the old towns, especially those near the seaports, the natural center was the intersection of two main highways. On the four corners were set the church, the school, the post office and store, and a dwelling. But often a third highway cut through at some distance from the junction of the others, forming a triangular-inclosed space. Lexington shows this type of village Common at its best.

In 1711 the town bought the plot of ground, about two acres, bordered by the Concord, Medford and Burlington highways, and "dedicated" it to public use. Immediately a pound, stocks, and hay scales were installed, and the village life, which had been unconsciously centering, was now given a definite nucleus. In 1744 the town gave John Muzzy "approbation" to keep a "publique house of entertainment," later known as Buckman's tavern, a rendezvous for the Minute Men, and still in excellent condition. The church, with belfry beside it, was close by, and some years later the first normal school in America, a handsome colonial edifice, was built. The whole effect is beautiful and restful to eyes accustomed to the harsher notes of the modern world. And Lexington intends to preserve its Green against commercialism and poor taste. The adjoining land is voluntarily restricted to its present use for 100 years, or to such use as the abutters shall unanimously approve.

THE GREEN AT LEXINGTON
The tablet at the extreme left marks the site of first three churches in Lexington. At the extreme right is the house of John Harrington, where he crawled, wounded, April 19, 1775.

The memorial boulder marking the stand of the line of the Minute Men.

The old Hancock house.

The belfry tower at Lexington.

The Capt. Parker statue at Lexington.

The building most intimately connected with the affairs of Lexington and of the nation is the old Hancock house on what was then the Bedford road, now called Hancock street. It was built in 1689 by the Rev. Mr. John Hancock, and in 1733 one of his sons added the ell. The house lacks the unity of line prevalent in colonial dwellings, but it retains many interesting features. The floors and wainscoting, of hard wood and unpainted, have taken on, with time, a deep rich color. The doors are quaintly paneled and retain their original fastenings. The kitchen, with its great fireplace, still fitted out with cranes and pots and spiders, recalls the old-time hospitality.

In the rear of the house is the study with its narrow windows and folding shutters. Here the minister read aloud the news of the colonies which he alone in all the village received. Here he evolved long sermons, weighty with doctrine, but barbed with shafts of zeal that roused his hearers to complete self-forgetfulness for duty's sake. No small part of the events of that April, 1775, were inspired and set on foot in those four narrow walls.

In those days preachers were men of action. On the morning of April 19, the minister went with his men and carried them ammunition, and, throughout the struggle, he was an unyielding force for freedom. Mr. Hancock was succeeded by the no less able and energetic Jonas Clark, the two completing a ministry of 105 years.

The Rev. Mr. John Hancock was the grandfather of the patriot, John Hancock, who with his friend, John Adams, was a frequent visitor at the house. Here he met and wooed the sprightly "Dorothy Q.," niece of Josiah Quincy.

On the night of the 18th of April, Hancock and Adams were guests at the house, and one of the objects of the British expedition was their capture. A reconnoitering party of officers in disguise had, the day before, visited the town and learned their whereabouts.

It was the custom of British officers to ride out through the country, partly for pleasure and partly to glean what information they could pick up. But that was a game that two could play and not infrequently the smart lieutenant found that he had somehow given more information than he had received, and had been outwitted in repartee by the slow-spoken rustic. They tell of an officer who drew rein beside a stone wall in Lexington and hailed the farmer who was working in the field.

"You sow," was the greeting, half in jest, "but we shall reap."

"That may be," was the reply. Then, after a pause, "I'm sowing hemp."

About 10 o'clock, the evening of the 18th, the fateful expedition embarked at the foot of the Common in boats belonging to the British vessels-of-war, at anchor in the Charles.

"They will miss their aim," said a citizen who was standing near, to Lord Percy.

"What aim?"

"The cannon at Concord," was the cool reply.

This uncanny knowledge of what he supposed was secret alarmed the Britisher and he gave orders that no one be allowed to leave the town. But he was too late. Joseph Warren had already sent out couriers to go by different routes, Paul Revere through Charlestown and Dawes through Roxbury. Just before the expedition embarked, Revere had rowed across the river in sight of the British ship Somerset and now stood waiting on the opposite shore for the lanterns, "one if by land and two if by sea," to flash from the belfry of the old North Church. About midnight, he drew up before the Hancock house in Lexington. A passer-by warned him not to make so much noise, for distinguished guests were sleeping there.

"Noise," was the bluff reply, "we shall have noise enough presently. The regulars are coming."

By that time the clergyman and his household were aroused, the courier came in to rest a moment, and the alarm was rung from the belfry. Mrs. Hannah Winthrop has left us a picture of that midnight warning, the hurrying of the men, the terror of the women, the pleading of the lads to join their fathers, and the grandsires taking down from the wall the old queen's arms that they had borne at Louisburg.

Hancock, who was somewhat of a dandy, his lace and points being always in the latest style, and who no doubt was especially ready to play a hero's part before the fair Dorothy, was bound to join the Minute Men, but his soberer companion restrained him, insisting that it was folly thus to give the enemy what they most desired. After considerable argument, the two friends, "King" Hancock and "Citizen" Adams, were smuggled away to a place of safety. In the meantime, the advancing British were amazed to see the countryside up and stirring. It was deemed wise to halt and to send one company ahead, and it was this detachment, under Major Pitcairn, who, as they entered Lexington, found General Parker's Minute Men drawn up in double file on the Green. That spectacle of a few farmers, opposing the invasion of their village by at least 10 times their number of trained soldiers, is one before which the hurrying world may well pause. Our older poets have best interpreted the scene. Whittier writes:

"Their feet had trodden peaceful ways;
They loved not strife, they dreaded pain;
They saw not, what to us is plain,
That God would make man's wrath His praise.

"No seers were they, but simple men;
Its vast results the future hid;
The meaning of the work they did
Was strange and dark and doubtful then."

In exasperation Pitcairn halted his troops. "Disperse, ye rebels," he cried, "and lay down your arms." But the line held firm. To his order to fire there was no response, but the soldiers obeyed the second command, and the first blood of the Revolution was shed. After a skirmish, the British proceeded toward Concord, and there on the further side of old North Bridge where

"* * * * the embattled farmers stood
And fired the shot heard round the world"

they found themselves confronted by another line of Minute Men, equally determined.

Under American Shingles: Irv Cobb's Home

Paducah, a City of Quick Stops and Slow Starts

By HARRY E. BARNET

The IRVIN S. COBB of today.

QUICK stops and slow starts mark a walk down the streets of Paducah, Kentucky, if a person is accompanied by an old-timer.

"See that mule?" comes the sudden query, and you halt, one foot in the air, as if you're about to step on the mule.

"Which mule?" you reply, because Paducah has a bent for mules.

"The old mule with the floppy ears," is the answer. "Now, that old mule—"

Your uplifted foot slowly returns to about the same spot it left a moment before. Then you hear the groundwork of an Irvin S. Cobb story.

"And the reason Cobb writes so well about horses and mules, and dogs and birds, is because he knows what they think about, and why they think that way," is the conclusion. Then you move on.

"The old fellow crossing the street—" prefaces another Cobb story in the raw before you get very far, and again you're at a standstill while it is told.

Here's a boyhood picture of Irv Cobb taken in Paducah. The x indicates his position in the assemblage.

You go along Paducah's streets in this quirky fashion, because Irvin S. Cobb was born and "raised" there, and he is chronicler of the city's fireside history. He takes stories of the everyday life of his home town that have been scraped of their human interest until they're as bare as the back of your hand, and he drapes these stories with whatever belongs to them, down to the last detail. What he hands you then is subtle romance, holding the lights and shadows of the "Purchase," so-called to draw a line between it and the "Blue Grass," as well as the "Pennyrile" sections of Kentucky.

Putting a case: The books say Judge Bishop was a noted member of the old Southern school of jurists; that for years he sat on the bench in Paducah, McCracken County—and there the books and description end.

From this statement, Judge Bishop might have been a hard-shell, and his career as empty of stir as a darky camp meeting without an exhorter. Bishop—"Priest"—you get the connection between the names. When "Judge Priest" came in sight at the head of a long string of stories from Cobb's typewriter, you got Judge Bishop's sayings and doings arrayed in their full dress. Along with the sayings and doings you got exactly what men and animals did to make history in the "Purchase," and thereby give Judge Bishop his chance to be a notable—particularly what "Mittie May," his old mare, did; her outburst from placidity to the jauntiness of her circus days at the first notes of music, an outburst that wrecked a famous Eighth of August Negro parade, to cite an instance.

One other illustration: Everybody in Paducah knows all there is to be known about John Dye's pup.

"He was a shaggy little dog," comes the story as you pause to let one of his progeny move easy-goingly out of your way, "and a pretty decent dog he was at that. But every week he'd make the rounds of the saloons, lapping little puddles of stale beer he could find. When he was drunk he'd go home, sleep it off, and do it all over the next week."

Behind the hum-and-haw gait of a pup that fell into the habit of making for home with three sheets in the wind, Irvin S. Cobb saw a character that earned its niche in local history. He lifted the pup there.

"Cashes In" on Paducah

"AND every year we notice Cobb's stories are more Paducah," you're told as you walk along. "He's 'cashing in' on his remarkable knowledge of Paducah history and people. His characters are real people—some of them were real people who are dead—and he writes about them as he saw them through his eyes. And, if you know them like we know them, you can see their faces shining right through the stories.

"Irvin is helped out by remembering every man, woman, child and dog in Paducah, and all their kin folk.

"He used to be a clerk, for instance, down in what they called the boat store. It supplied the steamboats with ropes and groceries, and everything they needed. Well, one day, I was walking down the street with Irvin when he was here on a visit to his mother, and he said, 'Hello, Bob,' to Bob McCann as we passed him, just like we'd been passing him there every day for a year. Bob stopped.

"'Partner,' Bob said, 'you got the best of me. You seem to know me, but I'll be hanged if I ever saw you before.'

"'This is Bob McCann, isn't it?'

"'Yes.'

"'I was clerk in the boat store when you were second clerk on the steamboat Clyde,' Cobb said.

"Now, that was 25 years ago, and Cobb hadn't seen Bob McCann in all that time, yet he remembered him, and spoke to him, and was going on, just as though he'd seen him yesterday morning. But Bob was sick at his stomach when he found out who Cobb was, and he hadn't remembered him."

"But do all of these people like it when Cobb puts them in his stories?" was the natural question, when the streets were patrolled, and the old-timer settled himself in the lobby of the Palmer Hotel—no advertisement intended, but it's the one place that reeks—the proper word to describe it—with the presence of Irvin S. Cobb. It was his loafing place, and is yet when he's in Paducah. Consequently, his cronies foregather there to talk about "Babe." That's his nickname in Paducah, "and no one knows how he come by it," kite-tails the name.

"Why, yes, they like it," is the reply. "Cobb is Paducah's hero."

His Picture in Library

EVIDENTLY. The first thing you see when you walk up to the desk in the public library is a picture of Irvin S. Cobb. It's one with a rakish hat set on his head—babbling sort of a hat, which tells the whole story of literary success. And, in a history of Paducah you're shown this: "Walk south on the west side of Third street, and pause midway between Washington and Clark—a marker there gives intelligence of the birthplace of Paducah's most illustrious son. The marker reads: 'This tablet marks the birthplace of Irvin S. Cobb, June 23, 1876.' It is a simple thing, this tablet is; but it shows where the house stood which cradled the world's greatest humorist, the son of Joshua C. and Mrs. Manie Saunders Cobb."

That statement, too, is as full of details as what the books say about Judge Bishop. Here is what is lacking: Eyes scanning the sidewalks appears to be the habitual attitude of Paducah's flappers. They're not more demure than elsewhere. Chances are they are students, locating historic shrines as a part of their lessons. If they're not students now, they lately have been. Be that as it may, few markers of historic shrines in Paducah are plates on the ends of posts, as they are in other places. Practically all of the markers in Paducah are embedded in concrete sidewalks—which also is to say that Paducah is well sidewalked. When you start out to find the place, you're likely to walk over the telltale of it, and never know where you are. As for the Cobb marker, his birthhouse was an ancestral landmark—in early days the largest and most impressive homestead in Paducah. His mother was born there. The house and grounds were purchased a few years ago by one of Cobb's ardent admirers—"the man who can make the best mint julep in Kentucky," Cobb will tell you any time you ask him about it—and this admirer razed the house, built a bungalow, and put the marker in the sidewalk.

"I reckon you know what the world knows about Irvin S. Cobb," began the old-timer reminiscently.

"Well," he went on, "Paducah is called the 'River City.' It is on the Ohio River, at the mouth of the Tennessee. Twelve miles above is the mouth of the Cumberland River, and it's only 47 miles to the Mississippi.

"Down here there's a cigar manufacturer who makes a pretty good cigar named 'Irvin S. Cobb.' I guess you've smoked some of them since you've been here, for sentiment's sake at least. You found them pretty good? I thought you'd say that. Anyway, I was out on the Cumberland River a couple of weeks ago hunting around, and stopped all night there with a fellow who runs a little general store. He has a very comfortable home—a modern place in the country, with artificial gas light, and such conveniences. Sitting around after supper I thought I would show this man that I was among those present.

"'Well,' I said, 'I was out on a couple of bird hunts lately with Irvin S. Cobb.'

"'Oh, yes,' the storekeeper replied, 'he's that big cigar man down there in Paducah. What kind of a shot is he?'

"Fact of it is," the old-timer continued, "Cobb knows about as much as anybody does about birds. When he was a kid he had the most complete collection of birds' eggs ever known around here—even buzzards' eggs and crows' eggs—and that was typical of him. He always wanted to go everybody else one better. And, he's a pretty fair shot for being so big and fat. He gets around the country in pretty fair shape. Quail hunting is about the hardest work there is, you know, but Irvin gets away with it remarkably well, considering his size.

"But his wanting to go everybody else one better in everything he does is certainly rough on us down here.

"We're in no sense uninformed along the lines of limit poker. In fact, we think we have the pick of the state when it comes to limit-poker players, but Cobb's got our number for some reason or other. Of course, Irvin's made a lifetime study of poker information. He started training some 30 years ago.

"Anyway, Irvin's been coming back to Paducah on frequent visits now for something like 16 years, and not one trip yet has he failed to take the goods back home with him. We don't play big games—$2 limit—but it doesn't seem possible for us to hang anything on Cobb in the way of getting his money. We save our money from one trip to the next, to have plenty, and we think we'll do it next time—but we don't. Irvin rakes it in, and just laughs, and says, 'If you fellows want me to function as a wit, don't take any of my money. Let me win yours.' We let him win it, but it isn't to save him from being a witless—we can't help ourselves.

"But do you know 'Babe's the biggest eater you ever saw," the conversation went on, as the old-timer glanced around the hotel lobby, and heard and saw things reminiscent of Cobb. This time it was the announcement that dinner was ready in the dining room.

Always Looking for Food

"WHEN he was a kid he'd eat anything that didn't eat him first. That was one of his characteristics. He'd hunt high and low for something to eat, and he'd work hard to get the money to buy what he wanted For instance, the eighth of August is a big day for the Negroes in Paducah. Sometimes there are as many as 10,000 come here to celebrate. Well, one eighth of August Irvin was conductor on a street car that runs out about two miles where the celebrations are held That night he went out to celebrate on what he made, and the celebration was a feast. We ate a little of everything we could find for sale on the 'snack stands,' from 'hot dogs' to fried chicken, and Irvin got his fill for once.

"He always was kind of pampered about his eating in Paducah, except once. An old man down the street here had a peanut factory in those days," and the old-timer laughed. "That is, he bought peanuts and stored them in an old building. The boys got in the habit of going down there, finding a hole they could wriggle through, and eating all the peanuts they wanted.

"One afternoon Irvin wriggled on his stomach through a hole in the side of the building, and filled his shirt as it was on him with peanuts. He had trouble getting in through the hole, but he forgot about that when he had the shirt filled. Just then the old man showed up, and Irvin made a dash for the hole where he got in. But he was like the rat that went in a place when it was little, and stayed there so long it

(Concluded on page 15)

"Natural Causes"

A CONSIDERABLE portion of the agricultural press seems wedded to the present fiscal system of the United States and to approve its administration. The uniformity of its argument in the matter suggests a line of propaganda from some interested source, but it may be it is in the nature of an epidemic where one writer assumes as fact what another has said and takes up the hue and cry in a mistaken belief he is aiding his patrons, the farmers.

The burden of this argument is that the depression in agriculture for the past two years is the result of natural causes, and that the farmer has only to grin and bear his misfortunes and work for a better day; that his troubles are akin to storm damage and other "visitations of Providence" which make farming so much of a speculation at best.

If a man were struck with sufficient force he would be knocked down. That is a natural result of the blow, but no excuse for it. The assault is a criminal act, and the offender is liable to punishment for it. So with the farm depression. It was the natural result of the administration of the country's finances, as deliberate of purpose and as criminal as an unprovoked personal assault.

The theory that the volume of the medium of exchange must expand with production is sound. It is held by all sides of the money question. It is strongly emphasized by the proponents of the present system and is the chief argument in its favor. The elasticity of the Federal bank currency permits its increase in sections and seasons as needed. But the power to inflate the currency includes the power to deflate, and that power is wielded in the interest of those who profit by deflation. That power should rest directly in the government itself, but is delegated to friends of the international banking groups who dictated the act creating the system.

There is no secret about deflation. It has been boasted of as the policy of the Federal Reserve Board. Three billions of the currency was retired in 1920. The result was that one-half the available medium of exchange was compelled to do the work of the former aggregate, with the natural result that production—in other words, farm crops—was measured in the smaller volumes and the wheat, the corn, the cotton that had been raised on a basis of prices when the wheat was worth two or more dollars went on the market at half and less that figure.

It WAS a natural result, but the natural result of an assassin's bullet is death, and the man who shields a murderer is accessory to his crime.

There is the same degree of complicity in the farm editor who aims to minimize the outrageous crime of arbitrary deflation.

All Eyes on Iowa

THE primaries in Iowa are looked upon in administration circles as the most important yet held, and as finally indicative of the extent of the revolt against the party organization. The defeat of the administration in Indiana and Oregon, and the victory of Pinchot over Alter in Pennsylvania, are, in the professed belief of the President's supporters, but the result of outside causes aided by a natural reaction usually seen after a sweeping endorsement like that of 1920.

In Iowa the case is different, for the issue, according to authority partial to the administration, is a direct challenge of Progressivism to Standpatism, and the result is, therefore, watched with the keenest interest.

From the same source it is learned that the only hope of the administration is to prevent Smith Brookhart, choice of the Progressives, attaining the nomination for United States Senator. They realize that no organization candidate can defeat him, but hope, by means of a multiplicity of candidates, so to divide the vote that none will receive the 35 per cent necessary to nomination, so six other names will appear on the ballot in the primary. If this move is successful, Brookhart must stand his chances in the state convention. It is presumed the organization has more faith in its ability to control in convention than at the primary.

To one viewing the situation without bias, it would seem that such a desperate attempt to defeat the will of the party is suicidal. One has only to revert to the result of the Presidential campaign of 1912.

Waste in Public Business

BIRMINGHAM, Alabama, affords, at this writing, an example of prodigality that should illustrate the impracticability of men. With a bonded indebtedness exceeding $11,000,000 there is pending a proposition to issue $7,000,000 more. The purpose of this huge loan does not enter this discussion necessarily, but the avowed object is a worthy one—the schools. It is said the ambitious program of the Board of Education is not intended to be completed at once, but building operations are to be extended over five years. The full amount is to be provided in a single authorization to avoid the uncertainty attending the approval of successive smaller issues.

If the city is able to make the loan at par at five per cent, the interest will amount to $350,000 a year. This, added to fixed interest charges on other bonds, would carry the interest cost of Birmingham's bonded debt to more than $1,000,000. Opponents of the bond issue claim they are anxious for improvement of education but insist the same result can be reached without adding to the interest burden. They point out that the present revenue yields a surplus about equal to the interest of the proposed bonds, and by raising by taxation the amount intended for interest the new construction would be accomplished without the payment of interest at all. There is logic in this plan.

There is an element in the promotion of public bond issues which seems to stand out in this matter—the advancement of selfish ends. There is almost always, for that matter. Smith has land he desires to unload. He finds the market dull and his land unsalable; he at once sees the necessity for a public enterprise to take it off his hands. Jones may have idle money, and these bonds are a safe investment. Brown wants employment. This may assure it temporarily. Any of a dozen reasons may influence the ordinary man. But the real basis for the demand may safely be ascribed to Usury, a desire to keep up the interest rate on bonds. Without public competition for idle money, interest rates on commercial and industrial loans would not remain so high, and production would be cheapened. This in turn would tend to reduce prices in retail trade; for eventually the burden of taxation rests on the ultimate consumer.

Preacher-Sheriff Leaves Pulpit

AN UNUSUAL case is presented in Polk County, Iowa, where the office of sheriff is held by a minister of the Gospel. Among the officer's duties is the execution of criminals to be hanged. Of course, such occasions are rare but this sheriff had two hangings and thus found himself in a dilemma. If he hanged the convicted men while holding a pastorate, he was sure to be blamed, while his performance of the disagreeable duty might reflect also on his church. It was his duty to hang the men and he had one of two things to do—resign his office or his pulpit. He resigned the pulpit.

This statement of the case is the subject of comment among church papers, which disagree. Some insist it is the pastor's duty as a citizen to accept public responsibilities, while others assert his call to religious work must occupy his full time. Whichever is right no one will question the minister's decision is best. He could not occupy both places and do justice to either, and his choice is purely a matter of preference with himself.

Commercializing the Sabbath

NOT only Biblical injunction, but human experience, has demonstrated the economic need for a cessation from toil every seventh day. No vacation period, longer or shorter, although changes have been tried, ever has proved a true equilibrium between the fatigue of habitual employment and opportunity for recuperation. Deem it habit, or an ordained institution, there is no gainsaying that Sabbath observance is conducive to mental and physical vigor, and is as necessary as are proper food, pure air, and untainted water.

It may not be known generally, for business seems never to rest, that one of the greatest mercantile establishments in the world, not only has never solicited business through the Sunday papers, but has invariably drawn its curtains from Saturday night to Monday morning, giving as its reason that it does not believe in commercializing the Sabbath.

The position of this firm is unassailable. Example is as much a duty of conviction as is belief itself. The Sunday paper is in itself antagonistic to that rest required for man's good, but is an institution necessary to Sunday-commercialization. The president of the establishment referred to has explained it as an ethical principle established by its founders, making no mention of the business results. But the fact that the store has succeeded, has enjoyed a continuously profitable business, should bear testimony to the value of the plan. Much of business success depends on reliability and service, to be sure, but it is a matter of earthly experience that the strict follower of the plan of creation is the man of material success as well as of right living.

Economically, Sunday advertising is of little value. Whatever its merits, literary or otherwise, the Sunday paper is, and cannot but be, an intolerable mass of rubbish, from which only the initiated can pick the matter in which they are interested. Great glaring pages of perfervid announcements interest only those whose means require the strictest economy in purchasing, and who, unfortunately, are most frequently the victims of deceptive offerings indulged in by the firms depending on promises rather than on merit. The initiated news seeker rarely touches the sections of the paper in which most of these advertisements appear. The devotee of sport is content with the section that tells of baseball, athletics and the racing. Milady confines her attention to the society pages. Each has his own particular field, and few more than glance at the one he looks for. The golf links, the good roads, the Sunday discussions of economics, the parks, the river rides, the picnics, even the church service, all mean distraction from the Sunday paper, and Monday the only inquiry for it seems to be from the neighbor's child who esteems it a great favor to have the "funny pictures."

Our Good Citizen's Attitude

SOME time ago, the grand jury in Galveston, Texas, presented to the court a report that conditions in connection with the illegal sale of liquor were deplorable. They probably were. In many American cities at the present time, bootlegging is rampant.

The number of cities in which the public officials nowadays proclaim their disregard for prohibition is small. It is rapidly approaching zero. The number of cities in which genuine enforcement of the law is accomplished in a degree commensurate to the enforcement of other laws is also small. But this latter number is increasing.

Between those two types of cities there is another which embraces the vast majority of cosmopolitan towns. This latter is the city in which bootlegging goes on, saloons camouflaged as soft-drink places sell new-made liquor, and officialdom either tolerantly ignores blind pigs or hopelessly acknowledges its weakness in the face of open violation of the law.

It is to this type of city that Galveston belongs. It is probably neither better nor worse than scores of other cities in America.

But there is a situation in Galveston that is deplorable. It is this:

Mayor Keenan announced he would name 25 good citizens as special officers, empowered to bring about the enforcement of the prohibition law. He first planned to keep the names secret, but this idea brought a storm of disapproval from those who believed that it would open the way for impersonations of officers and oppressions.

Then the mayor appointed 25 good citizens as special officers and made their names public.

And the 25 good citizens, including seven members of the grand jury, declined to serve.

That is the condition that is most deplorable. Not alone in Galveston, but all over the country, the very citizens who know best what is right and what is wrong, content themselves with criticizing what is wrong and refuse to do anything to make it right.

Mr. Ford's Page

UNEASY lies the head that hoped for a "return to normalcy"; that is, a return to the old system where a man could go out in the morning to make his money and return at night having made it, with no questions asked, "How did you make it?" or "What did the people who did business with you receive to show for their part in the matter?" That kind of normalcy will not come back.

Though most of us have known this for a long time, the circles to which the people look for their financial views are just discovering it. The sign of discovery is a vast uneasiness; in some instances, a real alarm. There is more agitation in high circles today than there is among the people. It was the nobles of old that saw the handwriting on the wall; the people had no need of handwriting, they had seen the situation as it was.

And it is not the old impossible fear with which certain interests tried to fill the country months ago. It is not the fear of revolution as the propagandists understand revolution—a breakdown of social order and a riot of violence. It is a fear that the old easy system which created the trickster is soon to be no more. It is a fear that the machinery of exchange is to be mended so that the leaks between production and consumption shall be stopped up. It is a fear that a new efficiency study of our common interests will leave no place for the parasite.

In the midst of all this alarm the plain people pursue their way in a deep though unconscious certainty that the changes which portend are changes for the safeguarding of the common life, and not for its greater burdening. That in itself is the supreme sign that all is well. It is not society, but the barnacles which have fastened themselves on society, that show uneasiness. In the minds of the plain people there is a fearlessness and a hopefulness which indicate that, however disturbing the future may seem to special interests, it cannot but mean well to those who have always done well by the world.

Nobody fears uncontrolled change now. The changes that come will be constructive and to be constructive they will necessarily be fundamental. But there are degrees even in the fundamentals. The trouble with many efforts at reconstruction is that they attack matters which are not in need of reconstruction. The fact of the home—one husband and one wife with their children—does not need reconstruction. The fact that life is sustained by labor—that does not need reconstruction. The fact that in our collective concerns we delegate our sovereign powers as citizens to a group of our fellow citizens to use in the general interest—the fact of Government—that does not need reconstruction.

But, around and within these are methods and practices which not only need to be reconstructed, but are in process of change even now. As a matter of fact, if the home, and labor and government were not affected by the wrong methods and practices, these methods and practices would hardly be important enough to challenge general attention. It is just because they touch life at the point of the home, and at the point of the daily work, and at the point of the public interest that they are important enough to justify what is about to come upon them.

For ages the people did not see the relation between wealth and the power that oppressed their lives. And after they had won freedom from the power of certain kinds of oppression, they did not see how systems tyrannized long after personal tyrants had become impossible. It is only when they begin to see that this, and this, and this, is the very thing which accounts for that, and that, and that, that they begin another long step in their emancipation as freemen on the planet. And it is because they are now making a certain connection between this and that, that the powers which fatten on the normalcy of indifference are seeing the signs of warning.

Any one would think that the last power to feel alarm would be the Money Power, yet strange to say that Power is showing unmistakable signs of the utmost agitation and anxiety. Why? Because, though it is called a Power, it is not one. The Money Power was never so well aware of the powerlessness of money as it is today. It has discovered at last that money has power to move the cupidity of men, but no power to inspire their creative effort nor their confidence. Indeed, there is nothing that so destroys creativeness, and there is nothing that so banishes confidence, as Money when it stands alone as if it could achieve something of itself.

And that power is trembling today, is issuing circulars and letters, is making speeches and protests, all because the people have put this and that together and are seeing something they never have seen before.

What is this discovery which the people have made? Simply this: that in the money system there are loopholes and peep-holes, hidden privileges and tricky corners which enable the initiated to acquire the means of complete control over the people—complete control, from the food they eat, to the Government they obey.

People used to think that men gained this power of control by superior astuteness of mind, by great gifts of foresight and industry. But they have lived to see with their own minds that the financial race is not necessarily a race of mental giants, but only a race which possesses a secret door into the money system. The system is built to permit that. It is as if the United States Mint were built with a pipe-line through which leaked into certain private coffers a percentage of the money which the Government makes. No one would say that the owner of the pipe-line was a superior person or a great financial leader, though his possession of great sums of money which no one could get in a lawful way would give him a certain power.

It is not the money in the people's pockets that is under suspicion, though even that is an uncertain enough quantity. It is the money system, with its leaks, with its opportunity for a "stand in," that is under suspicion. The people have seen that there is a distinct relation between the intensity of their daily struggle for existence and the queer twists of the money system.

And as soon as the people see this, the Money Power begins to show the greatest excitement about it, and to shout about "sound money." It is as if a burglar should protest against better bank locks in the interest of safety! It is not money that anyone wants to trifle with, but with a system that leaks into the pockets of exploiters what should go into the pockets of producers. And again it must be understood that this exploitation is not alone due to the superior cleverness of greed, but is due to the very make and shape of a money system which renders it not only possible but easy for such exploitation to be done.

That is what the people are seeing, that there is a crack in the structure. No one would say that a farmer was interfering with the wheat market when he repaired his granary so that the grain could not leak out nor the rats creep in; yet the Money Power shrieks that "sound money" is being endangered when anyone insists that the crack in the money structure be sealed up. It is only a sign that the people have put this and that together, and the exploiters know what it portends.

WHEN the farmer mends his granary, no one shouts that he is trying to ruin the wheat market; yet when any one tries to mend the leaks in the money system, there immediately goes up the cry that "sound money" is in danger. It must be that some one finds profit in the leaks and rifts and imperfections of our money system. You may gauge the direction of the danger by observing where the cries come from. They come from those who profit, not by manufacture, or trade, or farming, or transportation, but by money-juggling. It is not "sound money" that is in danger, but a system that allows expert "players" to win advantage over honest workers. That system certainly is in danger.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

ONE OF THE RAIDS, NOW NIGHTLY OCCURRENCES IN CHICAGO.

Balkanized Chicago

American City Geographically—That's All

By LEWIS HARPER

THERE was a crackling of gangsters' gats on the West Side. Two policemen fell in line of duty. The nightly black-powder bomb smashed a building job and Chicago woke up to meet headlines which reminded old-timers of the Haymarket riot. Next day the police raided the hangouts of the Building Trades Camorra and jailed about 150 of the species known to Chicago newspaper readers as "labor leaders." The *Tribune* asked, "To whom does this town belong?" and hinted of Vigilantes.

The 8:30 Northwestern L left Argyle Station on time next morning crammed with prosperous-looking "good citizens." Nearly everybody in the rear car had a *Tribune*, there were four *Herald-Examiners* and one *Journal of Commerce*, the latter blazing with the sort of scareheads that it affects to scorn on every other day of the year. For once the *Herald-Examiner* had no scandal story on the front page, even though Fifi Stillman had testified the day before and Peggy Joyce was nearing Sandy Hook. "Hearst at his worst" had relegated all these to its inside pages.

There was excited conversation at the forward end of the rear car on the L train. A florid, square-jawed citizen, holding his *Tribune* firmly gripped in one hand, asserted that he had positive information that Morvich would not go to the post at the Kentucky Derby on the following Saturday. "The bookies couldn't stand it," he grimly declared, and his auditors seemed convinced. That settled, the discussion veered to the comic-strip breach-of-promise suit of the widow Zander against Uncle Bimbo Gump, and continued until the guard shouted "Randolph and Wells, change for the West Side."

Two months ago Judge Kickam Scanlan, chief justice of the Cook County criminal court, delivered a charge to the Grand Jury ordering that body to find out why Chicago juries will not convict criminal labor union officials. Simon O'Donnell, former president of the Chicago Building Trades Council, who was succeeded by Thomas Kearney, now under indictment for perjury, whose successor was "Frenchy" Mader, now indicted for murder, had just been acquitted a few days following the acquittal of William Quesse, president of the Chicago Flat Janitors' Union. Quesse was charged with conspiracy to extort money by threats, and the use of bombs, and so on. But why go on with this story of the House that Jack Built? After telling the jury that many important unions in Chicago are controlled by convicts and professional criminals, Judge Scanlan said, "These men have by their reign of terror created in our midst a species of yellow men. But it remains to be seen whether they are able to conquer the red-blooded Americans of this community."

Indeed it does. It still remains to be seen. But the 1920 census is not very encouraging for the red-blooded Americans, if numbers are going to count in Judge Scanlan's war.

District Attorney Crowe has also hinted at Vigilantes. Somehow, the writer finds it hard to visualize those red-blooded Americans on the Northwestern L as Vigilantes. The "Trib" calling for Vigilantes—first part of King Henry IV, Act III, by Mr. William Shakespeare—

Owen Glendower: "I can call spirits from the vasty deep."

Hotspur: "Why so can I; or so can any man: but will they come when you call for them?"

Possibly the be-spatted stock-brokers and haberdasher clerks one sees on Sheridan Road may have the Vigilante stuff in them. One *can* imagine golf sticks discarded for rifles and visualize polo ponies charging in cavalry formation.

According to the geography book that we all read in the third grade, Chicago is an American city located near the foot of Lake Michigan. It is still located there and is American—*geographically*. Nay, more; it is the core of American industry. If you are talking of money, railroads, wheat, meat or a thousand other things that we all use and must have, Chicago is pre-eminently an American city. Otherwise she is not. *Racially and socially she is a suburb of Ellis Island.*

Consider Chicago, but do not condemn. What she is the other cities of America are fast becoming. Chicago is like other cities—only more so. In fact, she has one virtue more highly developed than most of her sisters; that is frankness. As much cannot be said for some of the others, especially some of the Pennsylvania and New England municipal monstrosities, where the American breed has become a human orchid no longer rooted to the soil of the country that was once its own.

There are about three million folk in Chicago, and these three million souls, it is probably fair to say, would stack up favorably, as men and women, with the average of any other city. But collectively they have no soul.

Chicago is not mongrel, but polyglot. Even a city of mongrels may develop a civic spirit, even though it be a mongrel spirit. Such a city could become conscious of itself and become a civic home for its citizens, but in a civic sense Chicago has become that polyglot boarding house against which Roosevelt warned us.

This may sound absurd to Americans who have heard since early childhood such household phrases as "Chicago spirit," "Chicago tongue," "Chicago cheek," "Chicago hustle," but those phrases are now historical. They refer to the civic spirit of those who built the city, the Anglo-Saxons, Germans and Scandinavians, who made it a great big town, but have failed to keep it a city—that is, a city in the social sense.

To sum up, the Melting Pot has Balkanized Chicago. It has become a vast *pot pourri* of tribes, nationalities, gangs, cliques, rings, sects, cults, which have crystallized into various alliances and combinations for purposes of defense, control or plunder. The balance of power system was never more firmly entrenched nor more perniciously active in the chancelleries

FRED "FRENCHY" MADER

"CON" SHEA

"BIG TIM" MURPHY

and military cockpits of Europe than it is in Chicago today. The lurid news of crime, banditry, murder, bombing, degeneracy, graft and official corruption which Chicago has broadcast over the United States for the last few years is but the echo of this condition.

It is well worth analysis even in the scant outline which the compass that an article of this sort permits. It is worth while for the American people to understand it. Not that they may point out Chicago as a pariah but that they may consider carefully this prototype of what they themselves soon may be if they cling to the cult of the Melting Pot.

Just at present the element in this Balkanized ensemble that is attracting most attention because it is more imminently menacing, is a clique of gangsters who acquired virtual control of the Building Trades Unions many years ago and who have been fighting to regain control by terroristic methods, in recent months. But there is nothing unique either in their control or their terrorism. Chicago is used to the black-powder bomb as a method of argument—it was used in the wars between the gambling gangsters years ago, to say nothing of its constant employment in family vendettas and political feuds between factions in Italian or Slavic wards. The gangsters who control a section of the building trades are the same sort of men who have flourished in alienized American cities for a generation or two. They are the type who once ruined the racing game in New York, and then went into white slavery for a livelihood, whose activities later culminated in the Tammany cadets of Bill Devery's time. They are essentially versatile and it was an easy step for them from ward politics, gaming and liquor vending to the labor movement.

The condition which Chicago now senses so acutely began in the building trades many years ago when employers displaced Irish and American "common laborers," hod carriers and ditchers with Italians, Poles, Croats and other races from Southern and Eastern Europe. These back home were used to the "padrone" or "little king" who always "spoke for them" to the boss. The padrones and interpreters soon learned the game of labor politics. Some of them became labor union officials and business agents themselves. Soon they were joined by enterprising gentlemen of the older stocks, principally Irish, because of their natural qualities of leadership and agitation. Where these newly fledged "labor leaders" found ignorant men at work—whether already organized in their primitive manner or unorganized—they soon whipped them into compact disciplined organizations. Gas workers, Negro jazz musicians, street sweepers and such classes were among those unionized by these "big mitt men" who entered the "labor game."

The "interpreter" or "little king" made his living by levying on his men, charging them for getting their jobs. The newer leaders soon extended their operations to the bosses—introducing the extortion strike or levying blackmail by threats of strike or sabotage. Later the system extended to mutual graft by the employer and the labor leader on the public. Many labor leaders became contractors or material men, driving out the older builders, manufacturers and even architects. Other employers were driven into line, and before long graft and corruption were systematized and all the charges were passed on to the public. Material men found that the crooked labor leader was the readiest instrument through which monopoly in materials and contracts could be set up, and materials manufactured outside of Chicago could be excluded. They had a "Buy at Home" movement of their own—and it worked.

In all this, Chicago has little if anything on any other city. The Lockwood Committee exposed a similar situation in New York before State Senator John Daily, about a year and a half ago, began to rip open a few phases of the situation which had created the housing shortage and the landlord's carnival of profiteering in Chicago. A few of the higher-ups in the material and contracting game were indicted—in the *Federal Court*—and these indictments are still sleeping there. Chicago knows this and wonders. And that blunts its horror of the means by which the crooked labor chiefs proceeded to bribe and blackmail their way to liberty in the state courts in which most of them were indicted. Practically every prominent labor leader indicted in the state courts escaped although the evidence against them was most damning. A spectacular miscarriage of justice which for a time seemed likely to result in something like a clean-up was the acquittal of Thomas Walsh, a labor leader, who in a drunken rage killed a prominent German saloon keeper whose place, a few doors from the City Hall, was a rendezvous for politicians. Judges and labor leaders—many of them prominently identified with the city administration of Mayor Thompson—gathered there. Some 70 persons were in the saloon when George was killed, including a former judge who is now United States minister to Hungary. It was a purposeless crime—inspired by hooch only. But the slayer walked out a free man, although still under indictment for having killed at the same time a waiter in the place. The Chicago "labor leader" of this type always owns a high-powered car and spends from $50 to $100 a day on drinks in the cabarets and saloons that still remain open in privileged parts of the city. Quite a few of them keep a scattered harem, in true Balkan or Levantine style. To those whom he honors with his confidence he explains that the money he gets from the big contractors and material men is really his "commission" on sales—that he is a salesman in that he enables the contractors and material men to sell their goods and services at a profit.

WILLIAM HALE THOMPSON,
Mayor of Chicago.

That it is the Melting Pot that makes such bandit chieftains possible in America can readily be grasped, when one compares the conditions in those building trades where the rank and file are of Alpine and Mediterranean stock, with such unions as the railway brotherhoods, the typographical union, or the various skilled shop crafts, where the rank and file are mostly "our own breed of dogs." These things simply "aren't done," to quote the effective English phrase, in such unions, composed of North European stock. They "aren't done" in the building trades in the smaller American cities and towns.

The international officers of the Building Trades Unions are an entirely different class of men from these local chiefs of the big alien cities, because their elections cannot yet be controlled by the Chicago and New York type.

Even in the Building Trades of Chicago the line of demarcation between the 12 unions which have followed the terrorist chiefs in opposition to the Landis Arbitration Award, and those unions which have stuck by their agreement to abide the award of Judge Landis, follows very closely the racial lines.

It should be remarked here that the Carpenters' Union, which never agreed to submit to the award of Judge Landis, is composed very largely of Germans and Scandinavians. For reasons of its own, including union by law and a racial tendency, it never was a party to the Landis award, but the opposition of the Carpenters is a different matter from that of the 12 recalcitrant unions headed by the terrorist gang. In fact, the side-line fight between the Carpenters and this crowd is one of the complications which make the situation so hard for an outsider to grasp. The terrorist group has been endeavoring to smash the Landis award, or to force some sort of substitute agreement, not because it has any particular grievance against the award, but simply because that method of settlement threatens their control and smacks too strongly of direct dealing between the public and the rank and file of labor. If direct dealing and understanding are brought about between the worker and consumer, the slugger chiefs will be Othellos with their occupations gone, and their squads of strong-arm men and dynamiters must also seek other employment.

CHARLES FITZMORRIS,
Chicago's Chief of Police.

The tendency of Chicago to make a Great Poo Bah, Grand Panjarum or Mr. Fix-it of Judge Kenesaw Mountain Landis, which has been the occasion of some humorous observations throughout the country, is itself indicative of the break-down of American methods of government and of American moral ideas. When baseball was tainted by contact with the gambling gangsters of Chicago and New York, themselves emanations of the Melting Pot, instead of the people proceeding to an old-fashioned American clean-up of the guilty in one way or another, Judge Landis was called upon to act as standing "umpire" of baseball.

When it became evident that despite the revelations of graft, corruption and violence made by the Dailey investigating committee that there was not enough virility in the governmental institutions, the police and the courts of Chicago to solve the building trades muddle by a drastic elimination of the guilty and the corrupt, why Judge Landis was called upon to make a "settlement." The way in which Landis has been burdened with all these tasks leads to the inevitable suggestion that Diogenes' lantern would never flicker for long before any other Chicago face than that of the picturesque jurist.

What of life and vigor there remains in the outward forms of government by law—the Anglo-Saxon institutions which Chicago inherits from a race which no longer lives in sufficient numbers within these outer trappings continuously to renew their strength—will soon be determined. Even now a decisive test seems to be at hand. The Big Three chieftains of the forces fighting the Landis award have been indicted for murder. They are "Big Tim" Murphy, "Frenchy" Mader, president of the Building Trades Council, and "Con" Shea. They are charged with having inspired the murder of Police Lieutenant Terrance Lyons and Officer Thomas Clark, done to death by a party of gunmen, who were evidently returning from a bombing expedition when they fell in with the police searching party and opened fire upon the officers.

A few words about these men will reveal that they belong to the regular gangster type. They would be running just as true to form as bandits, cappers for disorderly resorts, prize-fight promoters, racing touts or election repeaters as they are in their phase of the "labor game."

In fact, their associates have been of the types enumerated and they have shared similar activities in the past. They have also been the boon companions of politicians, dive keepers, police and court attaches.

Murphy organized the street sweepers and the gas workers into unions, after he had tired of a career as slugger in the circulation wars, which the Chicago newspapers used to wage against each other with private armies of thugs. He is now on appeal in the United States Circuit Court of Appeals from a conviction and sentence to six years in Federal prison for complicity in the Polk street station mail robbery of last year in which $380,000 was taken from the mails. Murphy was tried for having plotted the murder of a rival labor gunman, "Mossy" Enright, but went free after the state's witnesses "disappeared." To catalogue his arrests would probably require a column. In discussing the latest charges against him he remarked that public clamor amounted to nothing as the "oldest thing in the world is yesterday's newspaper."

Murphy is undoubtedly the brains of the terrorist group. He is frequently alluded to in the newspapers as the red-headed "labor czar."

"Frenchy" Mader, most recent of a long line of ex-convict presidents of the Building Trades Council, did a "stretch" in Joliet penitentiary some years ago for conspiracy to extort money.

"Con" Shea, who made his debut in labor politics in Boston, decided to begin life anew in Chicago after completing a term in "the big house up the river" at Sing Sing for stabbing his mistress—whom he cut to ribbons in a drunken rage. He was once president of the Teamsters' Union and conducted the strike 18 years ago in Chicago, which was the bloodiest in the city's history. Men were slain or blinded with acid thrown in sealed eggshells, while the streets were littered with hamstrung horses. It has been charged for years among honest labor men that Shea sold out this strike.

The ascendancy of this type of leader in many Chicago labor unions cannot be ascribed to radicalism. Such men have no abstract principles or program, although of course in their harangues they repeat the shibboleths of syndicalism and pirate the lingo of the I. W. W. However, the radicals say, and perhaps justly, that they are at heart conservative. Certainly they favor no changes in industrial relations that would interfere with their "business." On the other hand, the radical propaganda of syndicalism and even milder types of the socialist has helped them in many ways. It has sowed seed in the minds of ignorant men and made them available to the gangsters as sluggers and bombers. It has also produced a "class consciousness" among many workingmen, which makes it easier for the strong-arm chiefs to evade punishment in the courts or to cover up their tracks elsewhere. It has created a tendency to sympathize with them and against the law because they are believed to be martyrs persecuted by capitalism for their zeal for labor.

Socialism as a definite force in politics or labor is at a low ebb in Chicago and continues to wane. But as a manner of thought it was probably never more prevalent, dominating, among other elements, a large part of the clergy, the school teachers and even some of the "capitalistic" newspapers.

Ten years ago the Socialist party was a political force to be reckoned with in the city. It has dwindled to insignificance. The war split the old leaders, and after the war the Moscow-inspired "left wingers" completed the ruin with their rule-or-ruin tactics. Some of the old-timers like Adolph Germer or Seymour Stedman are still talking but that's all.

The I. W. W. is pretty well down and out despite the number of unemployed in the city who usually afford a fertile field for Wobbly propaganda.

The Passing of the Newspaper "Scoop"

The Old Days of the Exclusive "Story" Slowly But Surely Going

By CHARLES H. ZUBER

WHILE the quest for news on the part of the daily press is as keen—and probably more so—in the present day as it was at any time in the past, there is no longer the frequent production or creation of the newspaper "scoop"—as it was called in the West—or "beat," which was its eastern designation—that marked the progressive and insistent journalism of that period preceding the beginning of the present century. Of course, there arise occasions when one newspaper in a city will publish a good "story" that its rivals fail to obtain except as a "rewrite"; but on the whole, the newspaper field today, like all other industries and crafts, is so well standardized that the opportunities for putting a "scoop" over on the other fellow are decidedly remote.

Police cases, court proceedings, hotel news, financial affairs—in fact all the big sources of daily news—now are handled in such a way at their respective places of origin that there is little or no prospect of one newspaper getting an advantage over another. But it was not always so. In the old days there were advantages of various kinds enjoyed by individual newspapers or reporters that proved prolific fields for "scoops." In those days the newspaper or newspapers which had political affiliation with a city, county or state administration were always favored when a big story "broke," this preference extending to police departments, county court affairs and state news developments.

Trickery Ofttimes Resorted to

NOR was trickery excluded from the category of the news gatherers of those days. One of the common methods of getting a "scoop" was to secure petitions filed in suits which promised something sensational and then concealing the papers from the other reporters until the "story" was on the streets exclusively in one paper. Another common method of "putting one over" was to secure a live item from some individual, who desired to reach all the newspapers with his story, on the promise that the reporter receiving the statement give it to the other reporters. The promise always was made, but sometimes "forgotten," with the result that the reporters to whom the item was originally told scored a "scoop," while the man with whom the story originated was "in bad" with the other reporters, who would not believe that he had requested its general dissemination. Officials, police characters, business men, lawyers and others toadied to newspapers either as a matter of protection or to curry favor for future consideration, and in this way many a "scoop" was registered.

But under existing conditions, when the thirst for publicity and the fear of journalistic enmity is in the heart of every man who may become the guardian or source of a real news item, and with the various public agencies where news originates making known all their operations, the advents of "scoops" are few and far between. To what an extent this dissemination of "big news" has become general instead of exclusive, is illustrated in an incident in a Middle West city, where two newsboys were selling rival evening papers. One of the newsies was shouting aloud the "sensation" which his paper carried. The other vendor, standing close to the boy who was conducting the journalistic ballyhoo, waited until prospective buyers came within a few feet of him and his rival, when he would remark, in an ordinary tone of voice, "I've got it in the *Times*," meaning that he had the same item in the paper he was selling, with the result that, as his paper was the more popular of the two, he sold more than the chap who was drumming up the trade by his noisy shouting.

And the Rival Gets the Story

A UNIQUE "scoop" is that of which old newspaper men of a certain city in Ohio still speak with a decided chuckle. It seems that the cashier of a bank in a suburban city had been cutting quite a swath in racing and shady society circles. The rumor became current that he was short in his accounts, and on a certain Saturday night one of the large dailies in the big town received a strong "tip" from one of the cashier's "flames" that he had left town—also a large hole in the bank's exchequer. The newspaper tried to secure corroboration of the story from the bank officials, but, of course, they denied it. A reporter then was sent to the home of the accused man's brother for verification of the rumor. The brother flatly branded the yarn as a fake. The reporter insisted that his paper had the facts and would publish them. The brother countered with the threat that if the story was published the newspaper would have on its hands the largest libel suit ever filed in that section. After further verbal sparring, the brother repeated his threat of a libel, while the last words of the reporter were to the effect that his paper, having the "goods," would run the story just the same. However, after the reporter returned to his office and talked matters over with his chief, it was decided that there were not enough facts to justify the risk, so the story was temporarily shelved. In the meantime the brother of the cashier, taking seriously the threat of the reporter that his paper would run the story, bethought himself of a friend on a rival sheet who would be seriously embarrassed if this story "broke" on his route and he failed to get it. So he summoned his friend, gave him all the details of the defalcation, which amounted to nearly $200,000, threw in all the racing and white-light effects—in fact, furnished all the materials for one of the biggest sensations this particular section had ever seen. The next morning—Sunday—the newspaper which had the original tip on the looting of the bank came out without a line about the affair, while the paper that had had no inkling of it until the threat of the rival reporter caused the brother of the cashier to act, had the details of the defalcation spread all over its front page.

Another queer angle of a "scoop" developed in a certain city where the proprietor of a newspaper and another citizen advanced $250,000 to save one of the city's most cherished institutions. The newspaper proprietor failed to notify his editor of the matter, and the first the chief knew of it was when the editor of a rival evening paper telephoned him, just before making an edition, that he had not had time to make a real spread on the item, and that, if the other editor was willing, they would both hold the story for the second edition, to do it justice. The editor of the paper owned by the philanthropist pretended to make a concession by holding off, then sent his best men scurrying around to the proprietor to get the details of the gift in time for the next edition. He just managed to obtain the facts in time, thus saving himself and the proprietor the keenest humiliation. It is reported, however, that some years later this same proprietor allowed his own paper to be "scooped" in a real estate deal involving several million dollars and in which he was the prime mover.

Within the last 20 years there have been three "scoops" of an international character presented to the American people, none of which brought credit to the newspaper publishing them. One of them was the heralding of the death of President McKinley. Following the attack upon him by the assassin Czolgosz at the Pan-American Exposition at Buffalo, McKinley hovered between life and death, while an anxious world prayed and waited for the Divine verdict. Then one evening the newspapers served by a certain press association suddenly burst forth with extra editions, announcing the death of the martyred President, with all the touching and sorrowful details of the last summons. For a brief period the whole country was rent by grief over the report. And then came the extra editions of the newspapers of the rival press association with the story that McKinley still was alive, and that hope was held out for his recovery. The newspapers which carried the story of his death were deeply humiliated and offered excuses and apologies for their error. But it was a long time before the false report was forgotten by the public, even though McKinley's death followed within a short time after the journalistic *faux pas*.

Pope's Death Prematurely Reported

SOME years later a similar blunder was made by another press association in connection with the late Pope Leo. The eminent prelate had been ill for a long time, and his death was daily, almost momentarily, expected. So when the newspapers served by a certain press association came out with extra editions, announcing the death of His Holiness, the Catholic clergy everywhere ordered bells tolled, prayers said and other devout manifestations over the passing of a great churchman. Then came the report to the rival newspapers that the Pope was still alive, this being followed by a reaction against the newspapers that had carried accounts of his death which required many months to eradicate. The fact that the Pope died within a short time did not mitigate the sentiment against the newspapers which had mistakenly chronicled his passing on.

Carrying perhaps a greater shock than that of either of the two "scoops" above set forth, was that which followed the first announcement of the alleged signing of an armistice in connection with the recent World War. The people of the Allied nations, and particularly of America—as we can best judge—were heartsick over the awful carnage that was being waged by the contending armies abroad, and every little suggestion carrying with it the prospects of an early cessation of hostilities caused the wildest joy, not only among those who had sons, brothers, fathers and other relatives at the front, but among patriotic citizens generally. Then suddenly out of Brest came the story, credited to Admiral Wilson, that an armistice had been signed between the Allies and Germany, and that the war was actually over. This story was carried as a "scoop" by the newspapers served by one press association. Those who depended upon the news of a rival organization did not commit the blunder of accepting the original report as true, even though spontaneous celebrations were inaugurated in hundreds of places and hosannas of joy over the coming of peace were flung on high throughout the land. There came denials from Washington, from London and from Paris that an armistice had been signed; and from a feeling of the highest jubilation, inspired by the unauthentic report of a cessation of fighting, the nation was plunged into perhaps a deeper gloom than existed before the news of the alleged armistice was sent out. The reaction against the newspapers which published this story was extremely severe, and was not tempered for a long time by the fact that the armistice really was signed a week or so later.

A case where pure chance played a part in a "scoop" in connection with a murder case occurred about 15 years ago. Two dental students had been arrested for the murder and decapitation of a girl of their acquaintance. The head of the victim was never recovered, and the evidence against the two men was purely circumstantial. Either probably could have saved himself by turning state's evidence, but both held their peace. After they had been convicted, an appeal was taken by their attorneys. The arguments for a new trial were to be heard at the state capital, and thither attorneys and reporters went. Because of the particular brutality of the crime, the case had attracted nation-wide attention, so that the matter of a new trial was a national, rather than a local affair. In wandering through the state capitol, where the court which was to hear the appeal was in session, the two representatives of one of the dailies of the city in which the original trial was held, were accosted by an attaché of the state house, who informed them that, for a consideration, he would place them at a ventilator over the court room where the hearing was to be held behind closed doors, and where they could see and hear everything that transpired. The bargain was immediately made; plans were worked out by which one of the reporters, provided with a black flag and a white one, was to station himself at the opening in the ceiling, while the other was to wait a block away, in plain view of a window of the room in which the ventilator was located. If a new trial was granted, the watching reporter was to wave the white flag; if a new trial was denied, the black flag was to be shown. The reporter on the outside was to rush to the telegraph office immediately after receiving the signal and flash the word "White" or "Black" into his home office. The scheme worked perfectly. The black flag was displayed; the fatal word flashed to the newspaper office, and the resourceful and lucky reporters had the satisfaction of knowing on their return home that their little strategy had beaten their rival by nearly an hour in getting the story of the confirming of the death sentence on the streets.

This "Scoop" Brought No Boast

IT WAS in connection with this same case that the successful newspaper referred to registered a "scoop" of which it never boasted. One of the accused men hailed from a city about 60 miles from where the crime was committed, and there promised to be a wild race with papers to this city with the details of the execution on the day set for the hanging. The editor of the paper in question decided to be there first, so he secured all the details of the arrangements for the execution in advance and had an extra edition printed and dispatched to the town the night before, with instructions that they be placed on the streets at a certain time, based on the hour of the execution. Unfortunately the execution was delayed for two hours after the original time set for the hanging, with the result that a full and detailed report of the double execution was on the streets of the city 60 miles away fully an hour before it actually took place.

It may seem to be crowding the record of Ananias a bit to say that it is possible for one newspaper to "scoop" another on the account of a big-league baseball game, played according to schedule and in the presence of thousands of spectators. Yet this actually happened less than 20 years ago. It was during the telegraphers' strike that a team found itself in a series of games with the New Yorks on the Polo Grounds. Immediately on arriving in New York the traveling correspondents of the two evening newspapers who were accompanying the team, tried to secure wires from the ball park to their respective New York offices, from which they had private lines into their own home office. The effort was futile. Not only the foreign newspapers, but those of New York, also, were cut off from telegraph service to the ball park. One of the correspondents gave up in disgust. The other hustled out to the Polo Grounds, found a telephone in a blacksmith's shop opposite the ball park and rented it for the afternoon. He then secured the services of a cub reporter to manipulate the telephone, at the other end of which was the New York correspondent of the out-of-town paper. Relays of messenger boys were hired to carry the written results of the game by half innings from the ball park to the telephone, where the reports were transmitted to the correspondent downtown, and immediately relayed to the home town. That evening the newspaper with the persistent correspondent had a full account of the game on the streets 10 minutes after the game was over, while the rival sheet was perfectly blank as far as the account of the game was concerned.

Spats Lead to "Beat"

THAT a pair of spats should lead to a "scoop" seems rather a far-fetched assertion; but it really happened. Years ago, when certain producers were becoming prominent in the theatrical field, every city that did not have a theater leased by these producers was momentarily looking for an invasion of these hustling impresarios. One day the railroad reporter of an evening paper, while seeking news in the general offices of a trunk line road, noticed a man with pearl-gray spats in conversation with the general passenger agent. The visitor himself would have attracted no attention, but his spats did. So, after he left, the reporter inquired as to the identity of the man with the—as then considered—freak sartorial adjuncts. He was informed that the visitor was the attorney for the producers. A quick visit to his hotel revealed the fact that he was in the city to confer with local capitalists regarding the building of a theater; the paper with the observing reporter secured an exclusive story—and all because a man wore pearl-gray spats.

Catholic Theology and Interest on Money

Position of Church Councils Opposing Usury for Prevention of Oppression

By a Reverend Catholic Professor

WHEN a modern dips into certain ancient tomes of Catholic theology he is likely to run into a surprise. He has heard of usury in modern life, and he is in no way disturbed in the even tenor of his thoughts when he sees that these ancient volumes condemn usury, but as he reads deeper into the books the shock that he receives is more or less violent according as he has been more or less involved in the processes of modern finance. He finds in these ancient volumes that usury is not the nefarious practice which he has known by that name, but that instead it is the very innocent usage of modern business life which we call "interest." He sets himself down to try to find out what this means: Here in these ancient tomes Catholic theologians condemn the taking of interest, and in the everyday life about him he knows of Catholics in good standing who think nothing of accepting interest on loans, he knows of Catholic institutions who invest their spare capital in bonds that are loans, he even knows of churches that have money out at interest. Are Catholics of today running contrary to principle? Or has the moral teaching of a church which insists that its morality is unchanging really shifted? No, Catholics of today when they accept interest, at least within certain limits, are not violating their conscience, nor has the standard of Catholic morality changed. It is the circumstances of life which have changed.

Let us examine into this matter.

We do not want an expression of Catholic opinion more authoritative than one given by a pope in a general council. Gregory X in the Second Council of Lyons decrees thus: "And because the chance for interest-takers to get interest will be less accordingly as the freedom to take interest is lessened, in this general constitution we decree that neither a society nor corporation nor an individual, no matter what his rank, position or station, shall permit foreigners or other strangers who do or who desire to engage in money-lending for interest to rent houses or to hold houses by rent or to live anywhere within their lands." The application of this decree to strangers does not seem to mean that it was allowed to natives to take interest. If its history is investigated, it will probably be seen to mean that the only people who would be guilty of taking interest would be people from abroad.

This decree is interesting in the fact that immediately following the words in which interest-takers are condemned they are spoken of as *usurers*. This application of the term "usury" makes plain to us what is meant by the council of Vienna, the Third Council of the Vatican and the Fourth Council of the Vatican when they condemn usury. It is not usury in the modern sense of the term that they are condemning, it is not an excessive rate of interest that they ban, but the acceptance of any interest at all.

How clearly it was understood that even a moderate rate of interest was forbidden by the church is plain from the words of the great Benedict XIV when in 1745 he writes to the bishops of Italy: "That kind of *sin* which is called usury and which has its proper seat and place in the contract of Mutuum (loan) consists in turning that contract, which of its own nature requires the amount returned exactly to balance the amount received, into a ground for demanding a return in excess of the amount received."

The Why of the Church's Stand

IT WILL be noticed in this quotation that Benedict considers it a sin to make a loan with the idea of getting more back than one gives. It will also be noted that it is not a question of getting back any very considerable sum above that given, but of getting *anything* more.

Now why did these old councils of the church and why did these old theologians condemn the taking of even a moderate rate of interest? It is all explained by two quotations from Saint Thomas which though rather long are worth while introducing here for the clear exposition which they make of this matter.

In 2a, 2ae, q.77, art. 1, St. Thomas says: "If one party is much benefited by the commodity which he receives from another, while the other, the seller, is not a loser by going without the article, no extra price must be put on the article (that is, the buyer, though especially benefited by the article, is to give to the seller only what the article is worth to the seller.) The reason is because the profit which accrues to one party is not from the seller but from the condition of the buyer. Now no one ought to sell to another that which is not his though he may sell the loss which he suffers."

And in 2a, 2ae, q.78, art. 1, St. Thomas says: "To take usury (interest) for money is manifestly unjust because it is the selling of what is non-existent. . . . We must observe that there are certain things the use of which is the consumption of the things, as we consume wine by using it to drink and we consume wheat by using it for food. Hence in such things the use of the thing ought not to be reckoned apart from the thing itself; but whosoever has the use granted him has thereby granted him the thing; and, therefore, in such things lending means the transference of ownership. If, therefore, any vendor wanted to make two separate sales, one of the wine and the other of the use of the wine, he would be selling the same thing twice over, or selling the non-existent. Hence, he would be clearly committing the sin of injustice. In like manner he commits injustice who lends wine or wheat, asking a double recompense to be given him, one a return of an equal commodity, another a price for the use of the commodity, which price of *use* is called *usury*. . . . Now, according to the philosopher, money was invented principally for the effecting of exchanges; and thus the proper and principal use of money is the *consumption* and *disbursal* of it, according as it is expended in exchanges."

Therefore, the doctrine of St. Thomas and the Catholic church on interest in these older days was this: Money is a commodity, like food. You pay a man for the use *and* possession of it, because its possession without use is of no advantage. If a person lends another one hundred pounds of gold coin, he is to be repaid in the same way in which he would be repaid for one hundred pounds of wheat by getting back another hundred pounds of wheat or something equivalent to the hundred pounds of wheat. To the buyer the hundred pounds of gold and the hundred pounds of wheat are for use or consumption only. The gold and the wheat have no value beyond their use or consumption value, the same which they would have had had they remained in the possession of the seller. When the seller gets that value for them, that is, when the seller gets for one hundred pounds of gold, a hundred pounds of gold, he has the whole value of his money.

All this supposes that as the wheat, inasmuch as it is wheat, capable of being made into a certain number of loaves of bread, is in terms of loaves of bread not multiplied nor increased by the fact that it has passed from one owner to another, the money, inasmuch as it represents a certain power of exchange, is not multiplied or increased in value by passing from the hands of one owner to another. In other words, all this supposes that money is a dead, barren thing, incapable of increase or fruit, merely a means of exchange, just as so much paper or some other substance has been at various periods in the world's history.

Money Then Was Barren

THIS theory of money, that it was like a store of potatoes or of coal which we would lay in for the winter's use, but from which we expect to reap no gain, is a theory which lasted until comparatively recent times. When the Bank of Amsterdam was founded in 1609 depositors actually paid the bank to keep their money safe. Would they have done it, if they had had the modern view that the bank could make money from their money, or in other words, if they held that money in itself was fruitful? Clare, in his Money Market Primer, tells us that the reason why the capital of the Bank of England was so rapidly subscribed was this: "In those days gold investments were after all a rarity and the new undertaking, backed up as it was by the guaranty of a government that seemed honestly bent on paying its way, and supported by the best-known merchants in the city of London, appealed with success to the sentiments and pockets of capitalists, and by its happy combination of patriotism with eight per cent gratified at once their love of country, their love of gain and their hatred of tyranny and popery."

Here we have the theory of the unfruitfulness of money expressed in fact. History supplies other expressions of the same fact. The same author tells us that "in England almost up to the close of the seventeenth century, tradesmen or merchants, retiring from business, lived literally on their savings. It is stated that the father of Pope, the poet, having amassed a fortune in trade in London, retired to the country about the time of the Revolution, carrying with him a strong box containing nearly 20,000 pounds, out of which he took from time to time whatever was required for household expenses. It was the opinion of writers of about the same time that very large sums of money were continually kept hidden in secret places." All of this goes to show that in those days money was looked upon as barren. A merchant like Pope's father retiring from business in our days with a fortune of one hundred thousand dollars or thereabouts, simply because he was a merchant and acquainted with the uses of money, would have laid out such a sum in some such stable security as government bonds and probably have derived as much in interest as would have kept him comfortably without placing him under the necessity of cutting into the capital.

The Word for Interest: Usury

IT IS exactly because of the fact that to times comparatively very recent money was considered and was unfruitful that the Catholic church condemned interest of all kinds. In those older days, as Rickaby says: "Land was hard to buy, agriculture backward, roads bad, seas unnavigable, carrying-trade precarious, messages slow, raids and marauders frequent, population sparse, commerce confined to a few centers, mines unworked, manufacturers mostly domestic, capital yet unformed. Men kept their money in their cellars or deposited it for safety in religious houses; whence the stories of treasure trove. They took out the coin as they wanted it to spend on housekeeping or on war or feasting. It was very hard, next to impossible, to lay out money so as to make more money by it. Money in those days was really barren."

There you have the reason why the church forbade people to take any, even the least, rate of interest on money lent. The money was barren. To take interest was not to take the return for a value given but was to take advantage of a neighbor who needed money to buy food, to prepare himself for war, or in general to do something which netted him no profit. But suppose other conditions intervene! Will it remain unjust to take interest?

Listen! Leo X in the Fifth Council of the Vatican ruled: "Usury (then the word for interest) is properly interpreted to be the attempt to draw profit and increment, without labor, without cost, without risk, out of the use of a thing which does not fructify."

Suppose the day arrives in which money does fructify! Then the attempt to draw fruit out of it is not usury, is nothing which the church forbids. Now as a matter of fact, in modern conditions money does fructify. The very fact that a man has capital of larger extent apart from his ingenuity and application, enables him in trade to reap a profit not only arithmetically but also geometrically greater. The man who lends to big concerns the amount they need or part of the amount they need for their enterprises does this with the loss to himself of the chance of gain which he gives them. It may and undoubtedly is very difficult at times to determine just how much a corporation gets from the amount of capital which it borrows, but it does get a certain minimum of help and at least for that minimum of help the lender has a right to expect a return. The ideal rate of interest would be just that amount which the borrower gains merely from the borrowed capital outside of the increase which should be attributed to his ability and energy. This, of course, would make a scale shifting so much as to be practically impossible. It becomes quite necessary then to adopt a scale of interest which seems to fit in with the ordinary gain reaped from capital. This it would seem is just to the lender since he probably should be presumed as one who is capable of getting only the ordinary amount out of his capital were he to use it. It is also only justice to the lender even if his ability or application or luck or all of these be such as to give him greater gain, since as St. Thomas says: "If one party is much benefited by the commodity which he receives of the other, while the other, the seller, is not a loser by going without the article (in this case an extraordinary rate of interest) no extra price must be put on." (2a, 2ae, q.77, art. 1.) In these words St. Thomas clearly indicates the principle that the lender cannot bleed the borrower because the borrower happens to be successful beyond the ordinary lot of borrowers.

The same words to any thoughtful mind indicate that if the borrower be hard-pressed beyond the ordinary run of borrowers so that "one party (the borrower) is much benefited by the commodity (the loan)" the lender cannot for that reason charge him a rate above that ordinarily demanded.

Only one apparent and not real exception will be found to this principle, that is the apparent exception of a borrower who is in such perilous condition that it is a risk above the ordinary to lend him money. In such cases you will note that you have the "risk" feature which even in the days when interest was generally denied would allow interest without condemning it to the opprobrium of usury. See the words of Leo X above. You will also observe that to charge an extra rate of interest in such case is *not* to charge an extraordinary rate because the ordinary rate in cases of peril is higher than the rate where there is no peril.

Always Has Been the Same

THE attitude of the church, therefore, toward interest has not really been different at any time. The attitude of the church has always been that the borrower should not be made to pay for anything which he did not get from the lender. When money had no value, was barren, if a man borrowed from another he returned what he got, the sum given him. When money began to have value in itself, ceased to be barren, the borrower returned what he had got from the lender, the original sum plus what the lender had lost by letting him have it, which sum is after all what the lender actually gave the borrower. The term usury, therefore, which seems to have changed its meaning in the Catholic church, has not done so. It is a term which signifies an unjust return from a loan.

We are pretty well beyond the time when lenders could openly demand a rate of interest generally considered unjust, and and remain unscathed by the civil law. *We have not gone beyond the time* when lenders still charge an unjust rate of interest, and do so by means and methods just as underhand, we should say more underhand, and quite as unjust as those used in days gone by. It is usury to charge a man four per cent on a hundred dollars when you actually give him only eighty dollars as a loan, because, even if such dealing escape the law, it is making the man pay a usurious rate for his money. This of things in the small. It would seem to some of us, who may not have as clear a vision in the matter as we should, that this same species of usury is being plied in larger investments. For instance, some time back a very large concern, that happened to be in difficulty, floated a bond issue of twelve million dollars. It is said that after the men who handled this deal, brokers, bond houses, and so on, get through, this large concern will really have about nine million and a half dollars. Now this may be all right, but to the man in the street, it does seem that the price paid for the loan is usurious. Some amount more than the mere rate of interest should undoubtedly be paid for the placing of the loan but should the amount be almost a fourth of the sum supposed to be had by the concern in question? The rate on the bonds is not usurious, but are not the money lenders actually guilty of usury?

What's All the Pother? Oh, Yes, Nov. 7, 1922!

About Reaching End of Rope in Depending Upon Parties

By A. R. PINCI

A GENERATION ago Senator Calvin S. Brice, on being asked how he managed being "famous" in Washington when no one ever thought he was "any great shakes out home," replied:

"That's easy enough. You want to go on the assumption that 99 persons of 100 know as little about things as you do, and you are sure to hit it right. You must pretend to know all about everything, and always give the impression that there is nothing you can't accomplish. Always say you can do anything that is suggested, even if you know nothing about it. Then think up some way to do it, or else do something which will answer as well. But the main point is to know all about it."

There is the *modus operandi* of our average member of Congress, and by that is meant Senate and House. Less than 100 words reveal the secret of how to become a reasonably successful "representative of the people." An insider, and moreover a Senator, spake thus. Senator Brice's dollar prosperity could have been multiplied had he thought of establishing a correspondence school for congressional candidates. Of this there can be no doubt, because taken by the job lot, and filtering the most favorable as well as the least complimentary opinions of men whose appraisal counts for something, the Brice motto covers all of them. Divided by two parties, after subtracting from the total one member who cannot be appraised offhand, they are mutual admiration societies, unless they happen to squint toward the opposition.

It is only a few weeks ago that Representative Charles L. Underhill, of Massachusetts, said in a public speech that "some Congressmen are so ignorant that they never heard of Longfellow until he married Alice Roosevelt." This is Mr. Underhill's first term and obviously he has not had to attune himself to the atmosphere of Hoar and Lodge.

Self-Criticism in Vogue

ELSEWHERE, but also this year, Senator W. E. Edge, of New Jersey, publicly confessed that the Senate is taking itself too seriously and that he regretted "the determination on the part of the lawmakers to be jealous of their prerogatives." This, of course, was the sort of speech that politically is delivered with fingers crossed, a digital but fashionable reservation that unfortunately is not bracketed in the printed reports.

Senators and Representatives have evidently decided to join the anti-congressional chorus. But there is method in this madness. These few self-critics offer an opportunity to capable self-defenders to lull the ears of the voting proletariat with antiphonal praises. As critics exist on a ratio of one to a hundred, one can see where the public gets off.

Another singsong is that about the dearth of "strong" men in Congress. The people are confronted with descriptions of a "leaderless" Senate and an "obstinate" House. It has come to the point where even regrets are expressed that the day of the bosses is gone, while longing minds dwell upon fond memories of the fast-disappearing machine politics.

What's what?

Congressional elections are in the offing. One knows that the entire House and one-third of the Senate must submit to the constitutional requirement of a biennial election, but it is not so well known that this is the last year in office for some of the big fellows in the Senate. It's about these fellows, and these alone, that all the existing pother is about. No one cares about the others—that is, no one at Washington.

Their re-election will mean—but what matters it what it will mean to Washington? Washington has its eyes on 1924, and November 7 next is the first charted and labeled crossroads. Little wot they that the people are in the mood to close unexpectedly all existing roads and open some new ones. The people may send back to Congress the whole ticket, but 1924, presidentially speaking, is another story. And that story has not yet been completed, as it were, so it is preposterous to attempt to give it out now. The big question is about Congress, not about the presidency, and the two are no longer blood relations.

All That Is Changed

THE situation makes peculiarly applicable Senator Brice's theory because it is time-tested and therefore reliable. The times have apparently changed, but not so the standard of our public men. They assay about the same. What, then, is the trouble?

The fact is that in the days of Mark Hanna, or two decades before him for that matter, politicians could camouflage better than now. Those were the electioneering days when politics had the personal touch, and its possibilities toward egotistical publicity had not been discovered. To carry out the Brice idea it was necessary to do three things; wave the American flag, shake *hoi polloi* hands, and kiss a few babies.

Now all that is changed. The people are satisfied to see their flag from a high staff waving in the pure ozone, to keep their hands in their pockets lest Congress should grasp for more taxes, and to protect their babies from promiscuous kissing. In other words, resurging patriotism, defensive thriftiness and protective science have combined to throw the precocious and ambitious legislator upon his natural resources.

These resources are vocal.

But is that the worst of it?

It is not. A few years ago the politician had only his voice. Now he has his voice, his typewriter, his newspaper, his phonograph record, his radio, and it looks as if by November next the movies will fill the remaining void.

Multiply this campaign by several hundred, more or less, and the results will put any calculating machine out of the running, for none made will accommodate the grand total of political speeches, letters, articles, recitations, radiograms and photographs.

What can the people do against these virtually overpowering odds? And are they to go on, year after year, helpless wanderers in this recurrent political inferno? Must they abide by the unwritten motto that in public office none but the lusty deserve the fair?

The seeker of public office today, whether he be an old-timer inside looking out or a newcomer outside looking in, seems to agree that "publicity"—for these vociferations are called publicity—is destroying machine politics. But this sort of publicity has done and is doing nothing of the kind.

When it comes to electoral results, there is no difference between the predigested campaigns of a generation ago and the indigestible campaigns of today. In the old days the people voted because it was a mere formality; now they are voting for no better reason. In the old days the candidates were selected on the quiet and the people were expected to furnish the shouting election nights; these days the candidates select themselves and furnish their own shouting, too. The legend of the ground hog applies to the voters; they come out, see their shadow, and back into the hole again.

One thing, however, seems to be writ in the stars. This, by the way, is not a prediction, but seems the inevitable. The year 1922 will mark about the last campaign of this kind, and this is not even admitting that the last has not gone down into history. Next November may see thousands and hundreds of thousands of voters *prepared* but not yet ready to turn over a new leaf. It's a close race between constituencies and candidates, but if the latter should win it will be their last victory of the sort.

One thing that has led to complications, and not a few regrettable back-yard type of amenities, has been the habit of members of the two major parties to regard their own perpetuation in office as the price of their parties' success. Everything seems to center about the parties themselves and not enough upon the groupings of the men actually composing them. The result has been that everything today depends upon party when instead it should depend upon men.

"Achievements" in Politics

FOR a year before Woodrow Wilson left the presidency one heard nothing, offhand, that the Democratic party did that was good; just now, a year after Warren G. Harding has become executive, one hears nothing, offhand, that the Republican party has done that has not been perfect. There have been lists of "achievements" that should cause every voter, regardless of party, actually to blush, for the shame is his. Can one imagine the Lincoln Administration half a century ago, or the Jefferson Administration a century ago, issuing lists of achievements every few weeks?

These achievements are set forth as party achievements, but let's not overlook that their true purpose has been to keep before the eyes and ears of an annoyed country the activities of both Senate and House. In other words, Congressmen have spoken for and of themselves.

This biennial excitement has always a common premise; that if the Congressman of one party must go out it should mean that one of the opposite party should supplant him. In many instances the change is one of name; when it comes down to brass tacks, the legislative results are vapid. It is an ebb and flow that adds nothing to the legislative strength of the young nation. As a result, constituencies voting for changes like these get no better representation than they want, despite their cheap satisfaction of changing partisan allegiance.

The country is occasionally regaled with such statements as that made very, very recently (in fact, too suspiciously recently) by Representatives Martin B. Madden, of Illinois, that as a rule members of the House earn much more than the $7,500 they get. That is one way to achieve popularity in the House, even after a session that has not been without bitterness. A statement like that cancels from memory all harsh thoughts.

What do the people think about it?

How can they judge?

Well, they may judge by a simple expedient; that every two years, just about this time, the national legislators bluntly show that they are more anxious to stay in than the people themselves seem to show about keeping them there. These incumbents speak in the name of party solidarity, but the inner eye sees a job. That's all. As things stand in Washington today, congressing—for that's about what it is—has become a job, whether for the one who has made a habit of it or the one who has stepped into the Capitol for the first time.

In saying this it should not be assumed that there are no real legislators and no independent thinkers. There are, but the proportion is not considerable. In considering Congress one must remember its human equation—its weakest links, and these are, unnecessarily, too many. There are some incompetents, but in general the run of the mill is misfits. They have no conception of public office, and as they become acclimated they follow the line of least resistance.

They swallow hook and sinker, which means that almost at once they begin to think of themselves as superior mortals. It is not, therefore, as some observers vouch, a question of getting a better Congress, which means a greater proportion of responsible men, but to keep out so many superlatively "superior" ones.

Congress today is sitting as the Court of Last Judgment upon the people of the United States. Congress is so intoxicated with its own perfection and infallibility that it decrees and legislates everything that the population may or may not do. It is supposed to be the cradle of representative government, but somehow 500 men represent themselves, their hobbies, their prejudices, their personalities, their egotism. Collectively they are worse than fractionally. They reveal symptoms of weakness, of impotence, of panic, and while they let it be known that this uncertainty really represents that intermediate but long-winded stage known as "legislating," the truth of the matter is that they are sparring for time that they may make their best gallery play.

There exists, however, another type, but a very small minority, yet this minority is generally so powerful that it balances if it does not surpass the majority described. This minority may be identified in that type of perennial legislator who has reached that state of mind where he feels that his congressional seat is his and his own. He regards himself as the best part of that seat. He is intolerant of any opposition and in due time becomes a fixture. Primaries and elections to dislodge him are useless. Only a popular upheaval can knock him out.

No Bolshevistic Spirit

WRITERS of a kind have described them as "fossils." This term is as disrespectful as it is inapplicable. They have, in diverse ways, outlived their legislative usefulness. From within the musty corridors and halls of the Capitol they have been unable to keep the pace with the times. Instead of being practical men they are little better than graduates; their knowledge is a mass of theory, and because these are the men who usually direct the bulk of the more important legislation, one must not be surprised if the attempt to reduce heterogeneous theory into law yields some very unsatisfactory results.

Analyze most of the legislation of the past 10 years, or 20, at which time the country began to move faster than the minds of its legislators, and it will not be difficult to realize that it is predicated upon the basis of things as they should be or as they were, and not as they are.

This is peculiarly true of the legislation especially demanded in times of snap and stress like these. About all of it runs at cross purposes. The last five years have been plethoric. Yet who will deny that Congress is still considering legislation that ought to have been disposed of, had practical men been charged with the duty, quite some time ago?

A member of Congress a short time ago said that the work of Congress is "misrepresented or ignored, and that accounts, largely, for the growth of the bolshevistic spirit."

This Congressman meant well but he fell in error nevertheless. There is no evidence, in American constituencies, of a bolshevistic spirit. And to hold that misrepresenting the work of Congress can lead to any such radical tendencies on the part of voters is bunk—all bunk. The people have only one way to judge of Congress, and that is by national results. That these results are not so satisfactory as they should be Senators and Representatives have admitted, and they may be excused if pre-election panic makes them see things.

The signs, to repeat, are that the people are slowly beginning to see the light. With the average man perusing three pages of sporting gossip and dismissing a column of surcharged political gossip after an indifferent glance at the headline, it was to be expected that the resultant Congresses should be unsatisfactory. With the advent of prohibition the nearest thing we have had to political debating societies—mirrors, amber-filled glasses, mahogany and brass rails—has disappeared.

Women Possible Salvation

IMMATURE, imperfect, crude and illiterate as these meeting places were, politically it was something. Now there is not even that. All the politics one hears is of a high-brow sort, indulged in by fastidious, critical, partisan and selfish individuals. Just as the former kind reflected ward politics the new kind reflects a noisy but wishy-washy partisanship.

The one salvation is through the women. Suffrage has given them a new insight into politics, whether local or national. They are still in its elementary stage, and it will be years, perhaps, ere they can peruse political intelligence with thoroughness, sympathy and understanding. But it will be these women who will read that which their men will probably ignore, but it goes without saying that said men will sooner or later be obliged to puruse in self-defense, unless they prefer to hear about it *viva voce*—and feminine *voce* at that.

We are now undergoing this formative political period, and the near future must be regarded as essentially experimental and tentative. That is why November 7, 1922, may not be taken too seriously, and why it is out of the question to discuss 1924. The two are not synonymous.

FRED A. HOWARD

Testing a cloth subjected to a non-burning process.

Fred Howard: Miracle Man

A Tale of Modern Magic Is That of His Neutral Fluid and His Filamites

By J. OLIN HOWE

FRED A. HOWARD lives in a white colonial house, where he and his father and grandfather were born, in the typical New England village of South Easton, not far from Boston. To his neighbors he is just one of themselves. They turn to him with their problems and he uses scientific knowledge quite outside their ken to overcome everyday difficulties. For this quiet, simple, kindly man is one of the ablest chemists the world has known. In the seclusion of his laboratory he probes nature's secrets further than the microscope can follow him and he turns what he learns to most practical account.

From the beginnings of analysis chemists have sought the neutral fluid, utterly without chemical qualities. Mr. Howard has found it, has learned how to produce it. He takes an oil—any oil, animal, vegetable or mineral—and extracts from it everything which makes it an oil, breaks down the chemical globule and takes away every oily attribute, one by one, and in the end he has a fluid which is not in any sense an oil and is perfectly neutral.

This is of exceedingly small globularity and spreads and penetrates amazingly. It will ooze through an ordinary tin can with ease. It fairly defies the law of gravity by running up the bare arm one plunges into a container of it. It is neutral, not to be stopped by chemical opponent nor changed by chemical affinity, and it makes its way into a fibrous structure like leather, textile or paper beyond the power of oxygen—or oxidation, anyway—to follow. It can be used as the basis of any synthesis, the base of any chemical compound, the carrier of any chemical elements required to perform a given task.

What the chemist has already done with this neutral fluid is a story of magic and what may yet be done with it fairly taxes the imagination. One finds it all through the leather industry. Howard has improved many of the processes of tanning and manufacture. He redeems leathers spoiled in tannage or stiffened by water or burned and made brittle by the acids in perspiration. He waterproofs leather and makes it far more durable. Belting leather he doubles in tensile strength and, in special instances, renders it impervious to acids as well as water. And from such uses he and his neutral fluid have gone far afield.

It is the foundation of his manner of fireproofing textiles, really protecting them against fire. What this means in the case of workers' clothing goes without saying. With equal ease the chemist renders permanently proof against moths any textile, and without the slightest change in it which the eye can detect. Mildew in the heavy cotton fabrics of which sails and tents are made is a thing of the past, now that the neutral fluid carries into their fibers protection against the bacteria which cause it.

Horses and cattle find a boon, indeed, the compound on a Howard formula which protects them against flies and other insects. And many are the uses of a preparation based on the neutral fluid which destroys all odors of whatever character.

The chemist prepares a chemical film which completely and forever seals iron against rust. Filmed with this and painted, it may never have to be painted again. He prevents the disintegration of rare old book covers and rare prints by use of a solution which preserves them against decay. The neutral fluid is the basis of his treatment of white paper so that its appearance is not altered, but afterward silver wrapped in it will not oxidize if left for a hundred years. Men's and women's clothing may yet reach new low-price levels because of a radical improvement in the spinning industry, at the bottom of which is this wonder fluid of Howard's.

Besides, the chemist has made Mrs. Howard numberless dustless dusters.

Running along with all this is Howard's work with fibers. Here he strays over into the realm of physics, but what he has accomplished has been by chemical means. It had been accepted that fibers, those delicate strands with which nature weaves and man cannot hope to duplicate, were solid, but Mr. Howard found this a wholly wrong conception. Painstaking investigations made it plain to him that, far from being a solid structure, each fiber was but a bundle of lesser fibers and for these he coined the term "filamite."

Each filamite, in turn, was but the braiding of lesser filamites and so on indefinitely, and, using chemical agents, this worker of miracles has actually divided and subdivided fibers till he has crossed the borderline of human limitations. Unmistakable evidences of reaction convince him another subdivision has taken place, but it has produced a filamite too fine for human eye to see, even aided by the most powerful microscope.

This is reaching out toward infinity and the solemnity of the thought by no means escapes the chemist; but abstract science for its own sake interests him not at all. His discoveries all but take one's breath; he has on record more than 1,000 original formulas; he gains at will three different reactions his brother chemists have held to be impossible; and never once has he approached a problem from that angle. Ever this modest New Englander sees science as a practical resource. He is one of the most helpful men of his time. Only where there is a wrong condition to be righted or a difficulty with which chemistry can cope is this knight-errant of the science ready to tilt a lance. Then he always is.

Even so, the world has been laggard in treading a path to the Howard door, though for long he has been known as the trouble man of the leather field. Nor has Mr. Howard given much thought to commercial aspects or to money—unless he wishes to do some charitable act, when his right hand and his left knew naught of each other's activities. None of his many formulas is patented, though that is not so strange when one realizes that to patent a chemical formula is often to give away its secret.

Recently, though, friends determined that his long years of earnest effort, his thousands of experiments and his tireless search for truth, should not be lost to a careless world and that his future years should be free from financial worry. Financing the undertaking securely, they built him a fine new laboratory at Wollaston, Massachusetts, where Mr. Howard is now teaching a group of younger chemists secrets wrested from nature through the years. His secrets will not die with him.

First of all, Howard is a leather chemist and has been for 40 years, and he has left his impress on that industry. He didn't start out to be, however, and only became a chemist by accident. He comes

Photo reveals one of the many activities of Mr. Howard, who is at work in his laboratory. The beautiful hydrangea (in the circle) is a favorite of Mr. Howard's.

of a line of shoe manufacturers, but in his youth seemed scarcely strong enough for that and so went into the business of his mother's people, carriage-making. He didn't like it and shortly left it in favor of the spring water business, purveying the water of a famous spring on his grandfather's farm.

Soon he was making beverages from this, and in the end that made him a chemist. Their chemical composition attracted his serious attention and he read up on it. Naturally studious, he took up the United States Dispensatory and after once going carefully through its 2,000 odd pages, was so engrossed in the subject as to read it through again. Then he hired a chemist to come to South Easton and teach him the subject. Later he studied and worked with Professor Alexander Bernstein, a leading chemist then living in Boston.

When Howard hung out his shingle as a leather chemist in Brockton, most people wondered what that was. But he had been deep in the chemistry of leather for some time then. An uncle, a shoe manufacturer, had set the young chemist's thoughts in that direction by asking him to find why hemlock leather, a more durable tannage than oak, was often made so hard and brittle by the tanning process as to be all but unworkable. At the end of more than a year of hard work, Howard told his uncle why this was so, but even then he had only begun. In all the centuries of human development there had been almost no improvement in tanning and he found that tanners didn't know what they were doing when they went through the orthodox processes. Science had never been applied to their efforts.

The purpose of tanning is to preserve the skin or hide in flexible, usable condition. First, the grease, oil and other matter are cleaned from the fibers as well as may be and then tannic acid is introduced. Microscopic slides of the fibers of hemlock leather showed Howard that the resin of hemlock extract was not evenly deposited on the fibers, but often thoroughly disturbed nature's exquisite arrangement of them and matted and clogged them. Crystals of it, improperly dissolved at first, or which had recrystallized, lodged among the fibers, and across the keenly sharp edges of these minute forms tautly drawn fibers were often cut and broken.

The chemist's task was to break these up, to redistribute the tannin and, if possible, to get more efficient penetration. The details of his accomplishment of it would make a lengthy tale. Suffice to say that eventually he did accomplish it and on the way learned about fibers that which upset all previous beliefs regarding them.

But he was still a long way from his goal, for he had been working with minute quantities. He could use chemical agents on the head of a pin which would break up a tannin crystal and redistribute it; the problem was to make this practical—he could scarcely solve it with a multiplicity of pin points. He must have a suitable liquid carrier for the chemical elements he wished to send in and this didn't exist: or, I mean, it hadn't been discovered.

Wherefore, this patient scientist put on the shelf everything he had been able to do thus far, all his knowledge of fibers and filamites, and set out after—well, in reality, after the neutral fluid. He was to travel a long, weary road and meet many a setback, but went at the task with stout heart and was soon deep in the study of oils. Whale oil, fish oil, animal oils, such as neatsfoot and others from hides or wools, vegetable oils of many kinds, all came under chemical scrutiny.

Mineral oils would not do. All oils contain acids, but mineral oils contain too much. Lard oil was supposed to have its value, but Howard found it actually detrimental instead; there was too much stearic acid in it, and three months afterward the leather on which it was used was in worse condition than ever through volatilization and cementing of fibers.

When Howard began extracting from oils the undesirable qualities, he took a long stride toward his goal, the neutral fluid. One can cover with a sentence the months and years of untiring research, of achievement and disappointment, and always of unflagging toil in the laboratory. In the end there came out of it all a neutral fluid—which was not an oil, possessed no odor, was not greasy, did not attract dust and was of such small globularity as to spread and penetrate well-nigh unbelievably. He had broken down the oily structure, the chemical structure, and had removed every definite quality, leaving an absolutely neutral liquid.

With this as a carrier, Howard could penetrate his leather fibers at will and send in whatever chemical properties he desired; not in leather fibers alone, but in any fiber and, to an extent, in any molecular structure.

Beside the Howard home in South Easton, where one would look for greensward, there is a patch of buckwheat, which is not one of the chemist's agricultural experiments. That is for the birds. In the winter, when the snow has covered most of their food, they come and live on it.

"Why leave the growth so thick in that piece of woods opposite your house?" a friend asked Howard one day. "That ought to be thinned out if you expect to get any good timber out of it."

"I don't," replied the chemist, with something of embarrassment and even a bit of defiance in his tone, "That's my aviary. The birds have to have some place to stay."

The Things That Go Into Our Wastebasket

Sooner or Later That Which We Consign to It Is Likely to Come Out Again

By GAIUS GLENN ATKINS

THE morning mail is in and opened; what it is does not greatly matter—bills, receipts, some friendly letters, other men's problems, chances for doubling your money in six months, Russian, Armenian, Near East Relief literature, propaganda camouflaged with high disinterestedness—just a cross section, done in script and print, of a friendly, troubled, estranged, promoting, seeking, serving world. Croesus' purse could not meet all the appeals for help, nor Solomon's wisdom be equal to the requests for advice; propaganda is irritating, photographed starvation is depressing, and one's own work is waiting. File the receipts then, dream a little over the friendly letters and virtuously resolve to answer them, put the bills away against a more convenient day—and the wastebasket for the rest. Nothing is really more simple. One's desk is cleared and the real business of the day may begin, said business being in this particular instance the industrious preparation of material for other people's wastebaskets.

On the whole there is an apparent fine finality in a wastebasket. It is the efficient and officious instrument of an over-burdened age, the solver of problems and a very present help in time of trouble. Its dimensions convey no suggestion of its capacity; it will relieve you of responsibilities and take without a creak the burdens you cannot bear yourself; it will silence protest and absorb criticism and never answer back; it will serve, upon occasion, as a substitute for conscience and is always the silent partner of your judgment and the sure revealer of your concerns and loyalties. A man may be known by what he puts into his wastebasket.

It becomes a place for creeds and conventions and outgrown institutions, and failures and disillusionments, and all the things we do not like or do not believe in. In our more grandiose moments we consign nations and cultures and epochs to the wastebasket, and go on complacently about our own supremely important business. It is, perhaps, our greatest invention.

There are, however, arresting moments in which one may well doubt the finality of the wastebasket or the real value of the system which it symbolizes. The wastebasket never solves any problem save the problem of one's own convenience, and one may pay too high a price even for that.

Won't Remain In, He Finds

MORE than that, things refuse to stay in the wastebasket once we have put them there. A clever Frenchman once said that one of the occupations of the twentieth century would be to take out of the wastebasket a good many of the things which the nineteenth had too hastily and too confidently thrown into it. You cannot consign any great age to the wastebasket. Sooner or later it will come out again. An age is distinctive by virtue of its direction of the currents of human history or its literature, or its art, or its scientific discoveries, or the perfection of its manners, and you cannot ignore such things as these. They may have been associated with grave defects and been wanting in proportion or insecurely established, but, none the less, they remain as facts to be remembered or forces to be reckoned with and even if you do not take them out of the wastebasket to praise them someone will be always taking them out to find fault with them.

You cannot keep outstanding forms of social organization in the wastebasket. Democracy has been put just there again and again but democracy keeps coming back rich in the old hopes and warm with the old passions, sheerly refusing to be dismissed till we have met its high challenge and justified its ways to men. Autocracy and Socialism and Individualism come back through the window when we have turned them out the door. Religion is equally persistent. One may wonder whether there is not among us today every fear, every hope, every superstition, every faith, every doubt which humanity has ever entertained, or whether there be a once discarded dogma which does not, in some form or other, still persist. There is a resurgent power in whatever concerns the wonder or perplexity or conjecture of the soul and its longing for some saving contact with the Unseen and Eternal which defies time and rises triumphant above the wreck of civilizations.

Of course, I have overstated all this, but there is at least enough truth in it to give us pause. Evidently vital things cannot be dealt with by the wastebasket method at all, for whatever concerns humanity is as persistent as humanity itself. Passions and longings, embittering or enkindling discontents, disillusionments and the high resolve not to be defeated in the fight for better states and better things, belong to a dimension of life in which the wastebasket has no place. The forgetting of all this is responsible for a vast deal of our futile effort to leave our past behind us. One of the more radical representatives of the most radical school of modern poetry has been recently proposing that the art and literature of the past should be entirely destroyed. Each generation, he says, should consume not only its own smoke but its own creation, and leave for those who follow an absolutely white page at the beginning of every chapter in the book of life, and all this because the past not only so obsesses the present as to make free creation impossible, but because each present is rich in experience and sensation which demand absolutely new forms of expression.

The fallacy of all this, not to speak of its foolishness, lies in just this, that there are no new experiences or sensations. There are new vehicles but the resultant experiences are old as humanity. A motor car is wonderful enough but the man who first rode a horse and felt the wind in his face has exactly the same sensation of emancipation in motion as the man who drives his car sixty miles an hour. Flight may magnify but it does not transform, and the contention of the more advanced that we have a wealth of life and sensation unknown to our fathers and our fathers' fathers will not bear examination. If the past were destroyed we should be in no wise more emancipated, we should still be in bonds to ourselves and sooner or later, in answer to the same facts and forces, we should rebuild strangely as they built first, re-enact a great body of the law we destroyed and even lift against the sky those spires of aspiration which we had pulled down.

If All Did the Same, What Then?

BUT the truer principle of keeping and throwing away still remains to be considered. We cannot, in our relation to ideas and institutions and in our self-accommodation to the endless flow of life, keep everything; that goes without saying. Even our slowly accumulating fund of knowledge must, somehow, be disposed of. True, one fact does not necessarily crowd out another, but every mind has its Plimsoll mark and something of the old cargo must be jettisoned before a new cargo can be taken on. Laws need repealing as well as enacting. You cannot superimpose institutions beyond a certain point, nor write new articles in any creed without some crossing out of old ones. Whether we are dealing with our desks, our bookshelves, our attics, our societies, or our souls, the question of what to keep and what to throw away is always insurgent.

Life is here, as always, the surest teacher and it needs no long sitting at the feet of experience to discover in life generally an arrestingly revealing principle—the principle of continuity and reabsorption. For when we have looked into our own wastebaskets and discovered how little there is which can be permanently kept therein, we have only next to look abroad to be taught that the God of the Universe has no wastebasket at all. Unless our brave conjectures be wholly false even dead worlds and extinct suns are gathered back into the stuff of which they first were made, to renew their eonian cycles. What Time wears down, Life rebuilds, and it cannot be otherwise with the things of the spirit.

If, then, a wastebasket is a baffling and futile thing and if in life itself there is no place for a wastebasket at all, we shall have to deal with apparent wastebasket material as we deal with all the challenges and residues of experience. Part of it is manifestly a subject for action, part of it for reaction. Nothing which has any meaning for life can be finally disposed of save in the resolution of action. It is a far call from the Categorical Imperative to a wastebasket, yet if one acted always on a maxim fit for a law universal, these same wastebaskets would tell a far different story.

It is at least a wise caution to ask one's self, before putting anything which concerns need or duty into the wastebasket, what would happen if everybody else were doing exactly the same thing. No one of us can possibly put into the wastebasket what has had meaning for his own life, and still less can any of us, or all of us together, put into the wastebasket what has had meaning for humanity.

"The past," says Maeterlinck in a marvelously penetrating essay, and I think his use of the past may so broaden out as to include also our failures and what we have outgrown since these really are aspects of the past, "is often *le foyer* (the word is untranslatable, perhaps it means scene or stage or center) richest in activity of our whole existence and, according to the spirit which calls us back to it, certain of us draw from it all our wealth, and others of us are there swallowed up."

There is, then, no possible separating the past and all its content from the present or the future. There is a persistent and saving instinct within us which will not let us rest in the face of anything that ought to be, and is not, done. And even when the unaccomplished has become the *fait accompli*—the thing done—it is equally persistent. If it has been wrongly done, it still remains to be righted; if it has been rightly done, it is an aspect of the general well-being of life submerged often enough beyond recovery or identification in the fullness of our social and spiritual wealth and our own personal force but, none the less, a present possession in the loss of which we should be unspeakably impoverished. In such ways as this the true value of the past is to be sought in what the past has made of us and in what the past asks us to make of the future.

We cannot really dismiss anything until we have won from it its moral meanings, and resolved its warning or direction into some new and happier conduct of life, or else solved the problems with which it confronts us and turned its challenge into achievement. We cannot put the too confident idealisms of the nineteenth century into the wastebasket until the twentieth or some other century has given substance to those ardent hopes; we cannot put despotisms into the wastebasket until we have achieved an ordered liberty, nor throw away superstition until we have compassed a reasonable faith.

Measuring Is Necessary

THERE is, then, nothing of what we have been or done which has not its present uses; old despotisms are in a strange way the keepers of new liberties, shadowed superstitions are necessary backgrounds against which to see the true values of a luminous faith, and remembered failures give final meaning to present success. We cannot tell what is useful save as we measure it, on one side at least, against what has proved useless. So conceived, this, which we commonly conceive the property of the wastebasket, becomes the true wealth of the soul. And just as upon occasion we take down a book, whose pages we have left unturned for a decade, to verify a quotation or seek some happy turning of a phrase, or give solidity to shadowy recollections, so we approach this seeming wastebasket stuff of life for correction or guidance, light and power.

We concern ourselves, therefore, too much about what to keep and what to throw away, and our judgments of dismissal are often as futile as they are superficial. Our commanding tasks are more positive and more grateful; to assert the right of the present hour over all the competitive claims of past success or failure, to enrich today's deed with the meaning and discipline of yesterday's task and by the force and veracity of what vision we possess direct what has been and what is toward what ought to be. And if our vision of what ought to be is clear and right, shot through and through with high purpose and carried to fruitful issue in brave action, we need have no concern at all about the ultimate disposal of even the seeming waste stuff of life. It will take care of itself. What is worth while endures, what is in essence transitory, is gone and there remains of it all only today with its duties, tomorrow with its hopes, and these backgrounds of recollection in whose blended play of light and shadow detail is lost, distance softened, far horizons subdued to tender wonder and life itself enriched by a sense of mystic continuity.

Lexington, Whose Villagers Did Not Disperse

Concluded from page 2

Cautiously, a few of the soldiers advanced and began to take up the planks, but the steady fire from the Minute Men drove them back. The front ranks wavered, turned, and the battle became a flight, then a rout. The survivors from Lexington, who had followed the troops, now fired at them from behind walls and trees, and, had not Percy arrived with reinforcements, few would have again camped on Boston Common. On a hill in Lexington he set up a cannon to cover their retreat, and, under its protection, they passed the Green, sadder but wiser than when, in the morning, they had misunderstood the spirit that defended its peaceful beauty.

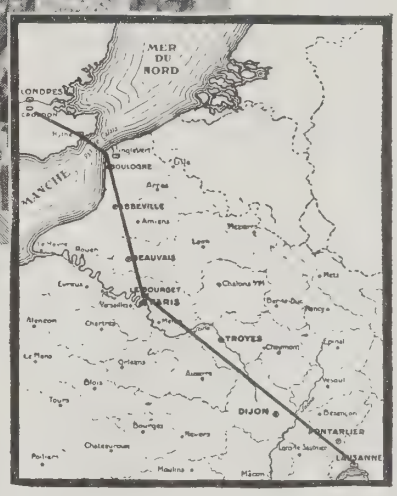
The general aspect of Lexington center has not so greatly altered since then. The Hancock house is as it was, the Buckman tavern, where Parker's men took refuge and whose clapboards still bear the marks of battle, shows no sign of decay. So with the old Munroe tavern, where Percy's men held back the rebels and which he converted into a hospital, afterward giving it over to plunder. The wooden belfry from which the alarm was rung has been removed to a little eminence overlooking the Green, and the old church, a plain, square structure, was taken to Captain Parker's farm. Here his grandson, Theodore Parker, worked and played until he entered Harvard College.

Many of the colonial houses from which the patriots issued that morning are still standing. One of the finest of these is the Harrington house. There were two Harringtons in that fight. One, mortally wounded, crawled toward his home and died a few steps from the door; the other, a lad of nineteen, a fifer, came out unscathed, and lived to the age of 94, the oldest survivor of the battle.

The Green now bears several monuments. One, a simple granite shaft, erected in 1799, is the oldest monument in the country commemorating the Revolution, There is a noble and spirited statue of a Minute Man, and a granite boulder marks the line of battle. On its smoothed face is carved the brief speech of Captain Parker to his men:

"Stand your ground
Don't fire unless fired upon
But if they mean to have a war
Let it begin here."

We of the present generation are in danger of losing the touch of reality of those high deeds. The gracious sweep of the elms, those silent witnesses, the simplicity and dignity of what remains to us of those days, inspire us with some small understanding of their grandeur. In general, Lexington is for us a symbol, a high ideal, expressed by one of our modern poets, Percy McKaye:



"For none who fall
At Lexington lie buried under stone;
And eyes of all
Who fight at Lexington look up to God
Not down upon his creatures under sod
Whose souls are sped;
They lie who say at Lexington free men are dead."

Transatlantic Aviation Is Near, Expert Says

Passenger Lines Through the Skies Soon to Connect World Centers

Above—Beauvais, France, as seen from an airplane on the route between London and Paris. (Courtesy of Handley Page Air Line.) At right—This trip, London to Lausanne, takes about 20 hours by fast train or boat; by air, it is made in six hours, with stop at Paris. The line has been established to give the Londoner week-end outings in the Alps.

By ROBERT J. THOMPSON

"YES," said my friend Charles Pélabon, president of the administrative council of the most important commercial flying company in Europe, "you will be going to America by flying boat in regular commercial flights in less than four years. There is no doubt about it. I set the date at 1925 conservatively. Dependable service may be established before that time. I would not wish to say. Ambition and rivalry in the commercial phase of the industry are intense, but the conservatism demanded by the strangeness of the air as a medium of transport and the considerations for safety we have always foremost in our minds are also great; greater, indeed, than our ambitions or our rivalries."

"The art of flying," continued this expert in aviation, "is new to man. It is still, in a very important sense, a fresh and experimental field. The physical difficulties yield and give way so rapidly to our efforts, that our chief problem is to adapt ourselves economically to the improvements going on from month to month. And there seems to be no end to these betterments. Machines are no sooner built and put into service, before changes are made; safety devices discovered; enlargements made possible, and so on, with the result that equipment does not wear out nor deteriorate, before readaptation has to take place and the machines junked or put into subsidiary service, to make way for something better.

"We will have all new machines for next year, stronger, larger, better and more suitable in every respect. We calculate that our business on the London-Paris line will at least triple in 1922 that of 1921. And there again we have no dependable standard of estimates. It may easily be 10 times greater."

Well, that all sounds very good, especially to those of us who are in Europe in business or for other reasons, and look with longing eyes to our connections at home in America and would go back and forth often enough for week-ends if it were not for the fortnight or month consumed by the now slow-going ocean greyhounds. This service of M. Pélabon cannot come too quickly for many of us. I suppose I have crossed the Atlantic not less than 30 times in the past 25 years, and that means, at the most modest calculation, not less than nine months at sea. Really, one gets enough of ships in time. Let us take to the air—and the sooner the better.

When one is up in the clouds a mile high, between London and Paris, and moving forward at the rate of two miles a minute, the consciousness of absence or remoteness from any place is not present, and it will be the same over the mid-Atlantic. One will know that within but a few lightning-like hours he will be at his journey's end.

And as the speed of human progress has heretofore kept pace with human movement—from the oxcart of the days of Abraham to the automobile and airplane of today, it would seem that mankind was just now pulling on an entirely new style of Nine-Mile Boots, or, indeed, had found a firm seat on the Magic Carpet of the Arabian Nights.

I will say something more here about M. Pélabon, because America is likely to learn of him during the next two or three years in a manner both agreeable and surprising. He is a serious young French bachelor, a pioneer in commercializing the air and modern airplane inventions for traveling, and is by way of taking the initiative with us, which has up to this time, as far as I know, been lacking, toward the actual establishment of a real commercial air passenger line between New York City and Chicago. He is a man of practical vision—plus, and is promoting commercial aeronautics, as he says, not so much to make it profitable to himself, but to spend a part of his great wealth in an interesting and useful way.

"My first flight was in a large airplane," he says. "I immediately bought the machine, and did so with the view of turning it to a useful purpose. This was the beginning of the so-called commercial air service between Paris and London. The enterprise moved slowly at first. Sometimes we could get but one paying passenger a month, sometimes more; then one a week; then several, and so on, until last season, we were making frequently two flights daily between Paris and London and vice versa, carrying for the day 30 or 40 passengers."

"What turned my thoughts to America in this connection, is the fact that at least, if indeed not more than, 50 per cent of our patronage is purely American. The Americans are a flying people. It is our plan to organize a passenger service between Europe and the United States as soon as possible. And as a part of our growth to this end, we believe that a dependable service, say from New York to Chicago, with stations and proper aerodromes at points like Buffalo, Cleveland and Detroit, must first be established and put into operation. It is our purpose to take our pilots, our machines, if need be, our commercial and technical experience, and our money, and put into operation for two or three years that stage of a Paris-New York-Chicago-San Francisco line from New York City to Chicago. Two or three years' service on this 1,000-mile etape of the course named, will see us ready to negotiate the Atlantic safely and comfortably."

Representatives of the Pélabon company soon will be in America to investigate the question of passenger air lines between New York City and Chicago. Incidentally, it is the further purpose of this company to open booking offices in the chief cities of America, for its London-Paris service. Much is expected for 1922 in the way of advancements over the previous records of business.

M. Pélabon is building 12 monster flyers to carry 14 passengers each, at a cost of $40,000 to $50,000 per unit. These machines will have a guaranteed life of 400 hours flying service, which is double the life of those now in use. It is expected that they may run as high as 800 or even 1,000 hours in actual performance, and this is a most vital consideration in the development of the industry, as the planes are now wholly scrapped when they have been driven for 200 hours. I learn that a new invention has been perfected and will be introduced in these machines which will eliminate the noise of the motors, do away with the exposure of light or flashes from the exhaust, and at the same time increase the efficiency of the engine power.

No other country in the world can show as many active factories with experts and special exploitation of the aero industry as France. French Government subsidies in this connection surpassed 30,000,000 francs in 1921, with the result that flying lines have been established for civic travel, and are being maintained between Paris and London; from Paris to Strassburg-Prague-Warsaw-Bucharest; from London to Lausanne, via Paris, and one or two lines south as far as Algiers in Africa. The activity is intense.

Louis Bréguet, French airplane constructor and the head of one of the French lines operating between Paris and London, has built a machine to carry 17 passengers, and it is planned to fly it, or one of similar type, over the Atlantic as soon as satisfactory demonstrations have been made, and the commercial expression of aviation has become more pronounced. He calculates that this machine, which was shown at the recent aero exposition in Paris, will travel 190 miles an hour, or speedier than three miles a minute. It will have 1,200 horse power, and carry a crew of seven men.

These things are here today and in sight. But listen to what M. Bréguet, also a serious-minded man and engineer, has further to offer to those of us who may have another five, ten or twenty years of this wonderful twentieth century ahead of us, before we go to the place where air travel is presumed to be more in vogue than on our good old mother earth.

He says: "By the perfection of air compressors, which we are now at work on, and which will enable us to reach and maintain a flight in the air, say at an altitude of 10,000 meters, airplanes will attain the great speed

(Concluded on page 15)

Balkanized Chicago, Geographically American

Concluded from page 7

W. Z. Foster, who captained the syndicalist-inspired steel strike of 1919, has returned to Chicago from a trip to Moscow. Again he is trying to gain control of some of the old-line labor unions and is making efforts to revive the outlaw railroad union which carried on the strike of 1920. He is making some progress among the railroad yardmen in this attempted revival but has had no substantial success elsewhere. With the assistance of John Fitzpatrick and Edward Nockels, president and secretary, respectively, of the Chicago Federation of Labor, he has induced that body to adopt some "One Big Union" resolutions. The Chicago Federation, however, is nothing but a Sunday afternoon debating society. It has degenerated, like central labor bodies in most other cities, into a resolution mill. Its resolutions mean nothing because none of its constituent unions will back them up. The only useful purpose served by the federation is to act as a safety valve through which certain types of radicals may blow off steam. Fitzpatrick and Nockels are no longer regarded seriously as labor leaders by workingmen, but to those outside the movement, especially the parlor "liberals," and the college and social settlement radicals and "intelligentsia," they appear to be significant figures.

They command a great deal of publicity in the newspapers hostile to trade unionism. These papers are only too eager to print their more radical utterances in order to discredit the labor movement and to promote the "open shop" crusade which is being actively waged on paper by the commercial secretaries and press agents leagued with the Illinois Manufacturers' Association. These gentlemen are naturally anxious to convince their employers that they are earning their pay—hence the sound and fury of the open-shop movement, which is making little real progress. Chicago remains a union town and only the folly of labor itself could destroy trade unionism here.

In discussing Chicago radicalism and its relation to the Balkanization of the city one fact stands out in contrast to New York—that is, the comparative insignificance of the Chicago ghetto. There is nothing in Chicago comparable to the millions of Russian Jews of the East Side and Brownsville.

In fact, the Poles and the Swedes appear to be the coming groups in Chicago's racial melange—which under the circumstances is not a bad sign. The German burgers and skilled workingmen have long ago ceased to be numbered among the newcomers and just to the north of Chicago, in Milwaukee, they dominate a city freer of bandits and bombers than any other city in America—so much for racial homogeneity in contrast to the crazy-quilt population plan of Chicago.

"Big Tim" Favored at City Hall

VIOLENCE such as that which now confronts Chicago would be impossible in any community where the police department was honestly and efficiently administered. It would be impossible even under Tammany rule in New York to the degree that it exists in Chicago, for the worst that Tammany has ever done to the force there is to render it morally lax. The New York force has never allowed itself to be flouted or defied by organized physical opposition.

The majority of the Chicago police force are, of course, honest and fearless but the man on the beat never knows whether the "higher-ups" want him to act. No matter what the chief may say nor how much authority he may be given, in statements for public consumption, the individual policeman knows that there is divided authority at the top. After he sees certain classes of men always go free after arrests he concludes that they have a "drag" and lets it go at that.

"Big Tim" Murphy has been favored at the city hall. He handles the street sweepers' union on election day. After his release from jail on the Enright murder charge he was received at the city hall like a conquering hero. There is no question that the Lundin-Thompson machine has "done business" with the Murphy group—just as it has done business with nearly every racial, religious or economic group in Chicago. In a Balkanized city a political machine must be continually forming and reforming alliances, ententes and coalitions. It cannot be nice in its choice of friends. Who ever saw a professional politician who cared *what kind* of votes he got? *How many* is the question.

The titular head of the political organization now dominating Chicago is Mayor William Hale Thompson, but the "man behind"—the creator of the organization—is Fred Lundin, a Swede, who rose from a patent medicine wagon and troupe of singers voicing the praises of Wizard Oil to power and affluence. He gathered together the wreckage of the old Lorimer outfit and formed some new alliances with racial groups to elect Mayor Thompson in 1915. In the campaign a quiet appeal was made by Lundin henchmen to elements which were apprehensive of the reputed political influence of the Roman Catholic hierarchy. This was a popular plea in many quarters. It helped line up the Swedish pastors for one thing and gave the Swedes a new-found political coherency which they had heretofore lacked, as compared with the more politically proficient groups.

Once in power these initial issues quickly were forgotten or discarded openly. For a brief time there was in evidence at the city hall and in a few police stations some anti-Catholic feeling, but it would take a microscope today to find any real evidence of such an attitude on the part of the Thompson administration.

How Mayor Thompson bid for the support of the Germans and other friends of the Central Empires, after he was elected, is too well known throughout the country to require repetition here.

Although Thompson is a shrewd politician, Lundin remains the real boss and organizer. Thompson plays a rôle very similar indeed to that of Hylan in New York, who is under the tutelage of Murphy and Hearst.

The operations of bandits and booze runners reached such a pitch some time back that Thompson announced a drastic reform of the police department by appointing as chief Charles Fitzmorris, former newspaper man, ostensibly giving him a free hand to clean up the department. Fitzmorris was heralded as an amateur, but in fact he is a veteran politician, having followed an early career as a newspaper reporter, with service as private secretary to Mayor Carter Harrison and filling the same job under Thompson. Fitzmorris claims to have done wonders toward the suppression of crime, he is well liked by the better class of citizens and has a favorable entree with newspapers that are opposed to Thompson. However, the city averages more than a murder a day, apartment dwellers are buying chains for their doors to prevent the entry of bandits, and business houses are being guarded by private guards to an increasing extent. Despite the advice of Chief of Detectives Hughes to citizens not to resist hold-up men, the sale of pistols has increased enormously, because the bandits have developed the habit of assaulting victims who are found with only a little money on them. District Attorney Crowe charges that Fitzmorris' clean-up claims are counterfeit and that the police, as of yore, are protecting favored gamblers and dive keepers.

Negro Vote Thompson Aid

ONE of the principal political assets of the Lundin-Thompson machine has been the Negro vote, which has increased in importance because of the migration of scores of thousands of Negroes from the South during the war, when they were brought in to man the war industries.

The Negro vote of the Second Ward turned the tide for Thompson in his first campaign. One of the Negro councilmen from that ward is the Thompson floor leader in the city council. The ward is a pest hole of vice and Negro political bosses in the ward operate some of the vilest dens ever seen on the North American continent. In these all-night cabarets orgiastic dances are performed by Negro men and white women. Thousands of the better element of the Negroes have signed petitions asking for the closing of these places, realizing that they furnish tinder, which a spark may light into race riots that would repeat the slaughter of 1919. The people have paid little attention to the newspaper revelations of these conditions, because Thompson, taking the Hearst cue, has harped steadily on the string that the public utility corporations are persecuting him because of his advocacy of five-cent fare. He has apparently convinced a large part of the people that the exposures of vice and graft are inspired by the corporations.

For seven years the mayor has been promising five-cent fare, but Chicago still pays eight on the surface cars and 10 on the elevated. The transit system is hopelessly out of date and the traffic congestion in the loop is choking the city's prosperity. All projects of subway construction have been halted by the mayor, who opposes any deal with the existing companies by which the proposed loop subways would link up with the present elevated lines.

The conviction is quite general, among newspaper men especially, that the Thompson organization wants the five-cent-fare political issue rather than five-cent fare, and fears that a settlement of the traction question would mean the end of its control.

The mayor's answer to this charge is that his plan, which requires the creation of a traction district on the lines of the sanitary district which built the drainage canal, has been blocked in the state legislature by the corporation lobby. He insists that his plan is the only way in which municipal ownership can be achieved without the people having to assume the burden of the watered securities of the existing companies. Chicago has voted for municipal ownership every time the question has been on the ballot and Thompson is playing keen politics in this appeal. It is also probably true that his traction district plan is the best, provided it could be kept free from graft.

Hearst in Chicago Politics

AS A factor in Chicago politics, Hearst, who loomed strong in the days of the last Harrison Administration and smashed Roger Sullivan with the vain hope of creating his own Democratic machine, has now subsided into a "Me Too" for the Lundin-Thompson organization. In Chicago, Hearst is an ardent Thompson Republican—in New York, a Hylan Democrat. After many years of rousing the proletariat and spitting the gizzards of the bourgeoisie on the pens of his editors, Hearst, it would seem, has ordered his Chicago papers to soft-pedal and rake in the dough, while the raking is good. The *Evening American* which has become odiously prosperous and is creeping up on Victor Lawson's *Daily News* in department store advertising, seldom says much these days that would ruffle the most conservative member of the Board of Trade. Of course, there are a few canned editorials, "Star Company" products, which occasionally remind one of the red-hot past. The *American* still slams the "traction barons," who are used to it and get paid for taking it. Even the *American's* cries for lower fares have become less strident recently since it has become somewhat evident that a fare cut means a wage cut. By the way, there will be neither, if it is left to the elevated and surface companies.

Hearst's morning paper is playing strongly to the business element. It is making strenuous but futile efforts to catch the *Tribune*. The two are the last survivors of the numerous flock of morning papers that prospered in Chicago when the Hearst *Examiner* was started some 20 years ago.

Except for the Hearst papers the Lundin-Thompson organization has enjoyed the solid enmity of the press and thrived upon it. The *Tribune's* fight against Thompson has been bitter and would be effective if it were not for the fact that Chicagoans as a rule do not credit its sincerity. The *Tribune* is one of the most interesting and virile newspapers in the United States, but few have been so successful in creating enemies. It has become like the Los Angeles *Times* or the Denver *Post*, a paper that everybody reads, but nobody follows. Probably the majority of Chicagoans today attribute the *Tribune's* relentless war on Thompson to the act of Thompson's school board in demanding that the *Tribune* pay a more adequate rental for the school property upon which its old building is located. The rental was ridiculous and the *Tribune's* position hardly defensible. Of course, Thompson's action whetted the *Tribune's* resentment, but Thompson would have had its opposition any way, as his associations and methods are distasteful to its controlling minds.

The *Tribune* is disliked by the majority of the Jewish element who have never forgiven the McCormick family for their former friendly and profitable relations with the Czarist government of Russia. A propaganda story against the *Tribune* in Chicago is that the *Tribune*—which had no influence with the Wilson Administration—induced Secretary of War Baker to send the American expeditionary force to Siberia, because the Bolsheviki had confiscated the plant of the International Harvester Company in Russia. This is an effective tale because there were Chicago regiments in Siberia and they suffered intensely.

Professional politicians dislike the *Tribune* because it will not stand hitched, because it bolted the Republican party in 1912 to support Roosevelt and because it destroyed the old Lorimer organization.

Its older readers are resentful of its growing tendency to play down to the mutt mind, by emphasizing sex stuff and freakish features. It is frequently remarked by the older element in the community that the *Tribune* is aping Hearst in his worst phases. This is a mistake. There is no imitation. James Keeley started the *Tribune* on that course, when he tried to print a three-ring circus every morning.

Strictly as a newspaper the *Tribune* is unworthy of its place as the principal morning paper of the fourth largest city of the world because it does not present for the intelligent section of a population of 3,000,000 such a picture of the world's events as they are entitled to. Its treatment of any running news story is fragmentary, hitting only the high spots. But freakish and changeable as it is, the imputations on the *Tribune's* sincerity are usually wide of the mark. It is independent of corporation control and has attained such a degree of prosperity that it need pay no court to any advertiser no matter how big his account may be.

Pioneers Stock Going Out

IN A way Chicago still has an American crust and front, but the older stock is being rapidly displaced, even in the banks and the courts which are usually its last strongholds—witness Massachusetts. In Chicago even the professions are being swamped by the newcomers. There are new residential sections on the North Side where a native American physician is a rarity, while the law schools are being crowded by young Jews.

The pioneer families of great wealth in Chicago show signs of pinching out. The flood of scandal stories in the Chicago newspapers has a significance that is perhaps only understood at the city's admirable psychopathic laboratory.

The men whose names were synonymous with Chicago before the fire of 1871 have left sons to waste their substance in riotous living. Names on the social register are frequently found on the police blotter, or the bootlegger's list. The gunmen and bombers can read of prohibition raids on fashionable social clubs most any time, and from such items make their own revaluation of American law and order.

As to the middle-class American—the man with an income less than $6,000 a year—it has become almost impossible for him to reproduce his kind. *The apartment house landlords will not allow American babies to be born and reared if they can help it.* At the same time the various welfare agencies in the slums across the tracks will see to it that child-bearing is made easy and child support assured for the alien mother.

Despite these signs of decadence, the native American stock of Chicago is, to only a very slight degree, responsible for the Chicago "Intellectuals" and their "new American novel" of filth and squalor which has so intrigued H. L. Mencken that he has declared Chicago to be the literary capital of the United States. Most writers of hobo banalities and dreary obscenities here do not hail from Chicago. The names of many show their origin elsewhere.

To these artists of the cesspool, American traditions of manhood and womanhood mean no more than the conceptions of American self-government and law mean to "Big Tim" Murphy, "Frenchy" Mader or "Con" Shea. Their "intellectual" strong-arm stuff is of a type with that of the sluggers and bombers whose trial impends.

That trial means much to Chicago. It determines whether the American constitutional and juridical system can survive, when the population it is imposed upon no longer derives its origin from the racial stocks that evolve that system from its heredity, traditions and history.

Mexico borrowed the American Constitution—it didn't work there.

Will Balkanized Chicago have any better success with American forms of government—or is the form already an empty shell?

Transatlantic Aviation Near, Expert Says

Concluded from page 13

of 27 miles a minute—and cross the Atlantic Ocean on the incredible schedule of two hours and fifteen minutes!"

Nevertheless, the English Government is keenly awake to the necessity of supporting commercial air traffic, as a preparatory school and conscript field for quick mobilization of military air forces in case of war.

As an example of the growing practicability and use of air traffic for post and freight, it is a fact that rates on the latter between London and Paris have been reduced from an original charge of $1.75 a pound to a present rate of 10 cents a pound, and that mail schedules have been established by the General Post Office by which special air mail pouches are handled from 15 or 20 English provincial cities, such as Liverpool, Manchester, Sheffield, Glasgow, and so on, including, of course, London, shortening the time of mail delivery to near and far eastern points from 24 to 48 hours.

All sorts of non-bulky freight parcels are carried, heavy machine parts, small live animals, birds, fancy poultry, cats, dogs, and so forth. A $5,000 Persian cat was carried over the other day. Many babies have been transported, and a shipment of 26,000 false teeth was made recently by an enterprising manufacturer. Insurance rates have been reduced to nearly nominal. The utility of air freight transport is demonstrated and it is growing rapidly.

On the other hand, the conviction is apparent in the British air ministry that if a military empire is to be maintained, that is, if the British Empire is to live as it was born, and has lived during the past, through military power, it must be handled in the future by an air force. The day of military transports of large bodies of men, of marching armies in foreign lands is past.

The Britisher has had enough of that. The *home fires* have been allowed to burn too low since the armistice, to bring this about a second time. Plans, therefore, are working for the establishment of military stations, with aerodromes, hangars and all the paraphernalia of war in the far-away places of the world, such as in Persia, Afghanistan, Africa and India. England's colonies, dependencies, protectorates, and so forth, number something like 80 or 90, if I am not mistaken, and to police them all with military units strong enough to resist revolution, and a struggle for freedom, such as is going on now in India, and recently in Ireland and Egypt, would be out of harmony with modern thought, and consequently impracticable from an economic point of view.

With these things in view, more especially, perhaps, than the altruistic support of commercial aviation, as now exhibited in her several established lines, London-Paris, London-Brussels and London-Amsterdam, she proposes paying for the manufacture of approved types of commercial planes, and leasing them to her two commercial air line companies at two and one-half per cent of the machines per month. When 31 payments have been made, or 75 per cent of the cost of the planes, the machines will be turned over to the companies as their own property. Besides this, a subsidy of 25 per cent of the gross receipts of the companies from the carriage of passengers, freight and mail is proposed.

This is the general subsidy scheme. It is not yet in operation, but will be inaugurated as soon as the companies are further developed by the present temporary subsidies of three pounds for each passenger carried on the lines and three pence for each pound of mail or freight. Under this emergency arrangement the government carries one-half of the insurance and agrees to take the planes off the hands of the companies after 45 per cent of the manufacturing cost has been paid, and replace them with entirely new machines.

The ensuing five or ten years will witness the exhibition of an intense rivalry between England and France for the leadership in aviation, ostensibly in the field of commerce and civic traffic, but in the background there will be the military aspect.

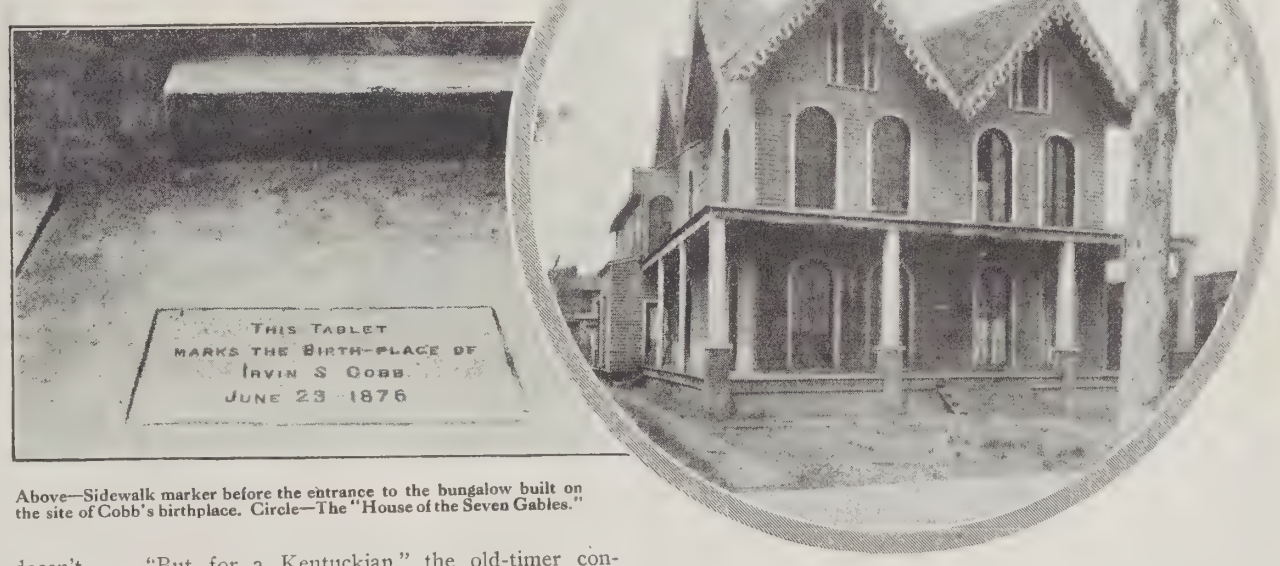
Under American Shingles: Irv Cobb's Home

Concluded from page 3

outgrew the hole. Irvin got his head and shoulders through, and there he stuck—his shirt full of peanuts, and on him, wouldn't let him go any farther. Well, the old man blistered him right well with a board while he was stuck there, and Irvin didn't get out until he tore his shirt off. I remember that every time I see a man with pompadour hair. Cobb was the first person I ever saw with pompadour hair, and I can picture him with it yet. You know, pompadour doesn't fit everybody, and it certainly didn't fit Irvin.

"But since he was 24 or 25 years old, Irvin's got lazy; he's changed. Before that when he wanted money he'd work at anything to get it. He was the most industrious kid in Paducah. During vacations he used to work on an ice wagon, because it paid him to do it.

"In those days, a white boy and a Negro worked together on ice wagons. The Negro did the work, and the white boy did the collecting. Well, Irvin had an awful big business. People preferred to buy ice from him, because when he was making change he'd tell them funny stories. While he was doing this his patrons would get tickled at the stories, and say, 'Oh, you go on, and keep the change.'



"Irvin always enjoys coming back to Paducah. There's no upstageness about him at all when he's here. He gets just as much fun out of us as we get out of him. Success hasn't spoiled him—he's just a big, lovable fellow, who has all the kids and dogs in town after him," conversation continued.

"I guess he gets more fun out of the kids than he does out of us, and we're his chums from boyhood. I notice him with my kids out home. He gets them on his lap, and draws funny pictures for them by the hour. With a pencil in each hand, Irvin can draw a horse with his left hand, and a cow with his right, at the same time. Or, he can draw a woman's head with his right hand, and a man's head with his left hand, at the same time, and that tickles the kids. Drawing two things at once was one of his kid feature stunts. It's curious, though, that Irvin doesn't write more darky stuff," was the statement marking the close of the conversation—it was dinner time, and noon dinner in Paducah is the event of the day.

"Irvin understands the colored people perfectly—their sense of humor; their originality of expression, and all that sort of stuff. And, he understands as well as anybody can the general basis of what a darky thinks, and why he thinks just that way. All the colored people in Paducah are for him.

"You never could expect to see anything quite as impressive as the talk he made to them in the Washington street Colored Baptist Church, and their reception of it, when he came back from one of his war trips. The place was crowded with Negroes. Now, this church has a very remarkable choir. I can just see the heart of Africa before me when they sing. Cobb was impressed with the situation when he saw his audience, and heard the choir sing, and he never will be in any better form than he was that afternoon.

"Irvin was talking about the things different Negroes did in France. He took the case of one, and then the case of another, calling each of them by name. The Negroes listened quietly for about 30 or 40 minutes; then they went wild. You know how they call on the Lord when they're excited? There was one old colored woman in the back of the church. After she got warmed up, and Cobb got warmed up, she would just say these same words, interrupting Irvin time after time: 'Oh, Lawd, jes' lissen to dis man's testimony.'

Above—Sidewalk marker before the entrance to the bungalow built on the site of Cobb's birthplace. Circle—The "House of the Seven Gables."

"But for a Kentuckian," the old-timer concluded, "Irvin isn't quite natural. Originally he wasn't a talking man for public purposes. Oratory, you know, is particularly a Kentucky gift. Now, you can't find a lawyer who is any easier to listen to."

What you've read is the outcome of a question: what does his home town think of Irvin S. Cobb? Companion to it is the query: what sort of a town is it?

Well, in Paducah you do not emotionally shrivel. You get the real sunshine of the South there—the warmth and glow, you know, that *is* the heart of the human South. Mingled with this sunshine is rich flower fragrance, and melodies that carry the true southern appeal to your senses. Paducah, also, is a very old place, and it has been a sort of a natural happening ground for typically American events. These events are treasured in typically American fashion, so that you get the full force of them.

The main topic of conversation in Paducah always, of course, is Irvin S. Cobb. After Cobb comes the "House of Seven Gables," a unique structure built on the Lower Ohio River—an old place, with a niche in war history. Lastly, there is the mad stone. The stone is about the size and thickness of a domino. When it is placed on a wound caused by the bite of a rabid animal, it is said to absorb the poison. During that time, the stone cannot be pulled away, without taking some of the flesh with it. When it drops off, no more poison is left in the wound. Then the stone is boiled in milk, and the poison comes to the surface in bubbles, about the size of new peas, and of the same color. Faith in this stone is widespread—victims of rabid animals come from as far away as New Orleans to have the Paducah mad stone applied to their wounds.

What's All the Pother? Oh, Yes, Nov. 7, 1922

Concluded from page 10

Democrats may talk until doomsday about the League of Nations and Republicans may do likewise about an Association of Nations. Arguments like these are losing their stumping usefulness. Much as the people may have preferences, their first experience has not been such as to conduce them to a state of mind where they wish to hanker for more. The slogan they like and can understand must be reduced to a universal as well as personal equation, something like the "full dinner pail."

International relations, judging by the growing mood of the people at large, will not figure for much as campaign issues, first, because the people themselves do not understand them, and, second, because they are policies that can be analyzed and weighed, by voters, only after they have been put through, and that by economic reaction.

The most ominous sign of popular dissatisfaction lies in the meeting of the two national committees to devise ways and means, as well as ways out. The Republicans are still staggering under an aggravating load of hundreds of thousands of dollars. The Democrats are not much better off. Both look to, and hope for, the "humble individual contribution," but nevertheless big contributions are necessary.

It is easier, in a way, to get $50,000 from one source than to split that sum ten thousand different ways. One is all velvet, moreover, and the other entails costly bookkeeping, which reduces the net. There is this disadvantage, however; that the $5 or $20 fellow kisses his money goodby, whether worth it or not, while the $50,000 fellow wants to look out first and look in afterward.

That is why the people have grown tired of the tariff and kindred affairs in their election issues. They suspect that the great ado about these things is related to capitalism, and there is no gainsaying the fact that Washington politicians still play to and for Capitalism. This Capitalism is not necessarily the ancient and hoary Moneybags; it is now assuming other forms.

Of course, it will be easy enough to say that the people are always as interested in bygones as of yore, and the politician up for re-election will play on this one string for all he is worth, but the best test is to take the voter unawares and ask him or her, "how about November?"

It will be obvious, therefore, that Congress has its strong men, few as they are, and they compare favorably with the historic members of the past. What is necessary, however, is that the rank and file of Congressmen be selected with a view to their being of greater service and usefulness to the people than to themselves. It requires selecting men who will not forget, as soon as they are elected, that they are public servants, in every sense of the word.

Otherwise it will be something like this:

"What we need is a more businesslike type of public servants, I think," said Mr. A. Voter.

"There you go, pa," his wife exclaimed, "talking about servants again! If public servants ain't any better than domestic ones—lan' sakes!"

That is not a joke conversation.

I heard it near Delaware, Ohio, halfway between Columbus and Marion, while visiting the two presidential candidates in 1920.

Reports from Geneva state that 49 men and one woman were killed during the winter sports season. This does not include 25 persons, the members of a Hungarian wedding party, who were killed trying to cross the River Tisza when the ice gave way, drowning all.

King Fuad, the new ruler of Egypt, suffers from a throat malady which causes him to emit a cry like that of a wild beast. Before he can speak or breathe with comfort he emits an unearthly sound which embarrasses him and his hearers.

An unbroken flint arrowhead was found imbedded three-quarters of an inch in the dorsal vertebra of an Indian skeleton found near Dublin, Ohio, recently. This is proof that Indian arrows were fatal and caused more than flesh wounds. Another example found in this region showed that an arrowhead had penetrated an Indian's brain one-half inch.

A new type of airplane wing made it possible recently for a Handley-Page machine to ascend and descend almost vertically in England. The new wing is slotted and operates like a bird's wing when it opens and closes the main feathers for slow landing.

Pistol Inn, of Chicago, formerly the wildest dance hall and saloon in the Middle West, was closed by Judge Landis a year ago and is now known as the Union League Club, a boys' club composed of street gamins of 11 different nationalities. Shakespearean plays are put on by the new drama league connected with the club, with all the parts taken by boys.

Ninety per cent of 753 farmers, who replied to a questionnaire in the eastern states, consider time saved to be the greatest advantage received from the use of motor trucks. Nearly one-fourth of these farmers are now selling at better markets than before they had motor trucks.

Mayor Oles, of Youngstown, Ohio, has announced his entry into the race for governor of Ohio, running as an Independent. He states there will be a campaign fund of $100,000, raised by popular subscription, and that a private train, a freight car load of red fire and a brass band will accompany him throughout the state on a speaking tour. His platform provides for a law to prevent cities from issuing bonds without first getting the approval of electors. The emblem he will use over his name on the ballot will be "a streak of lightning."

Dedication of 85 elm trees to the memory of John Burroughs, the naturalist, recently took place at Big Indian in the Catskills. Each tree represents a year in the life of Mr. Burroughs.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

Of the 22,000 criminals examined by the superintendent of New York State's reformatories, only four were college graduates. Seven per cent in a group of 1,000 prisoners had high school education, 25 per cent had finished grammar school, and 64 per cent had attended only primary grades.

An ancient Saxon law has been unearthed in England, technically known as "the doctrine of coercion," under which a wife virtually is the property of her husband.

The Bolshevist, George Chitcherin, was photographed at the economic conference in the act of shaking hands with Louis Barthou, head of the French delegation. When M. Barthou discovered that photographs had been taken of the exchange in greetings he demanded that the film be destroyed. The movie men ignored his request and prepared to show the film in the motion picture houses along the Champs Elysées.

A new marvel has been added to London life in the form of a collection of electric display advertising that has been erected on buildings fronting Piccadilly Circus in the heart of the theater district. The display makes the New Yorker think of Times Square 20 years ago but it is a novelty to the Englishman.

The Rockefeller Institute is studying the causes of yellow fever in Mexico and a special commission has been appointed to gather data on the work done by other medical societies and institutes at work in the fever districts.

A new aerial mail service has been established between London and Copenhagen, making it possible for mail posted in London in the evening to be delivered in Copenhagen on the afternoon of the following day. The line is operated by a Danish company, whose service also connects Copenhagen with Amsterdam and Rotterdam.

Pullmans for women are being run on the Chicago and Alton and the Wabash railroads out of Chicago and on the main branches. This is an innovation and is meeting with the approval of many.

Premier Lloyd George during his last visit to Criccieth, Wales, gave a tea party to 19 ancients who were his father's pupils at Troedyrallt school more than 60 years ago. The senior "old boy" was 91 years old and still works as a carpenter. Another guest, now blind, used to carry love messages between the premier's father and mother.

School children at a little village near Bucharest made up a purse to "aid the children of families made destitute through the destruction of the Knickerbocker Theater in Washington, D. C." The children believed the disaster was one affecting the entire American people and as Rumanian children have received aid from America they chose this method of showing their appreciation.

French traffic experts will try to solve congestion difficulties in Paris by reserving alternate streets for one-way traffic.

In a new fuel the combustible part of coal is conserved and the ash is eliminated. It is believed that this new fuel will find a market for the poorer grades of coal and present new opportunities to railroads and steamships which are dependent upon high-priced fuels. The new fuel may be stowed dry or in plastic or semi-liquid form and may be handled by conveyor or pump or fired by any automatic or mechanical device for firing coal. Tests prove it has 42 per cent steaming advantage over the best steaming coal available at this time.

New York City last year paid $100,000 for their supply of "frog legs."

Lignum-vitae is the hardest wood known. It is the only wood that can be used for the bearings at the stern end of the propeller shafts of steamers and nearly every large steamship is dependent upon a block of lignum-vitae for a smooth-running screw. The fibers of this wood weave back and forth, crossing and recrossing each other in a manner that resembles the weave of an automobile tire.

Piping made of paper by an improved process is the invention of a Frenchman. This piping is made by winding paper in a very tight manner together with the use of an adhesive compound. It is almost unbreakable and very light.

A lake, rich in carbonate of soda, has been discovered near Kulumda, Siberia.

Never a Dull Season Among Art Forgers

The Truth About the "Curb"

Chronicler of the Neglected Truth

There's Never a Dull Season in Art Forgery

An Industry World-wide in Its Scope; Products Go Into Homes of Millionaires

By WILLIAM A. McGARRY

This is the first of two articles by Mr. McGarry. The second will appear in an early issue.

Photo of a painting of the Duchess Visconti attributed to Il Bronzino, noted Florentine master of the early sixteenth century.

Photo of the same painting, partially cleaned of its modern fake and revealing some of the original on which it had been painted.

A still later photo of the same painting, showing more of the detail beneath it.

The original finally cleaned, revealing half a panel that formerly contained a painting depicting the miracle of St. John the Evangelist. This ancient work of art was destroyed to get an old panel as the foundation for the Bronzino fake.

AN INDUSTRY of world-wide scope in which there is never a dull season is the business of forging paintings in the names of famous artists. From headquarters in a half-dozen European cities, the products of this industry are sent over all the world, particularly into the United States and South America, where millionaires abound. Just now intensive methods are being used to expand the market in this country, for the business suffers with honest industries of international size by reason of the loss of the great Russian market.

In the articles of which this is the first an effort will be made to reveal not only the amazing extent of this form of swindle, but also the methods used by the forgers in making up imitations that will pass as originals even under the microscopes of some experts. Instances will be given also of the tricks employed by the sales experts of this great international swindling trust to get the publicity which is essential to the profitable marketing of their more costly spurious "masterpieces."

At the outset it should be made clear that the forgeries are not confined to the copying of work by artists long dead. Let a painter rise from the ranks of obscurity to a position of popularity, and before long he will find the market filling with supposed examples of his work of which he has no recollection and can find no record. When he dies the supply will double overnight, to an accompaniment of apparently spontaneous and unrelated newspaper stories purporting to tell how this or that example of the great man's work was "found." Fake paintings ascribed to Homer Martin, Inness and Wyant were sold all over the United States while their friends were still alive. The art stores were filled with alleged "Blakelocks" for years, while the painter was in retirement, and the stories of how he recovered from his illness to denounce the forgeries are still fresh in the public mind.

When it is said that all these forgeries done in America represent but a small part of the foreign business, at least in money value to the forgers, the reader may get some idea of the scope of the industry. Every artist knows that in every art center of Europe there are scores of clever copyists steadily employed in the making of fake masterpieces. To the artist it is a source of never-ending surprise that a market can be found for all these works. Knowing from his own experience the years of toil required for the most gifted painter to reach perfection; knowing that there are definite physical limits to the output even of a hack painter, he cannot understand why the rich American fails to realize that the supply of real works of art is likewise limited. Warnings have been issued at various times by noted European connoisseurs, one of whom asserted some years ago that if all the so-called masterpieces treasured by museums and private collectors were genuine some of the masters would have had to live 200 or 300 years to do the work now ascribed to them.

The forger has little difficulty in overcoming any suspicion that may be aroused in the mind of the rich American by these warnings. He uses the simplest form of flattery—the appeal to the Yankee pride in his ability to take care of himself. But his main reliance is on secrecy in disposing of the great bulk of his work. By far the larger proportion of the fake paintings bought are mere daubs that would not pass the scrutiny of the ordinary art dealer with only a cursory knowledge of masterpieces. The methods used for disposing of more high-priced fakes to collectors who are experts entail an entirely different course of procedure, which will be described later.

When an American who has not been a collector of paintings is picked out as a victim it is a simple matter for the forger or one of his accomplices to scrape up an acquaintance. That is generally done at one of the European resorts, where the American has gone for recreation. The forger prefers to catch him on his first trip abroad, when everything is new and strange. It is then no trick at all to be obliging and to show the visitor around. He is introduced to members of really noted families, some of whom are frequently well paid for their services in helping later to swindle him. In due time casual reference is made to some other "member of the nobility" who is in straitened circumstances. In a club or house party group to which the American has been introduced, for instance, some one remarks that this man who has seen better days may be forced to sell his "Van Dyke" or the work of some other noted painter.

It is explained, still without any apparent effort to interest the American, that the owner of the painting is too proud to offer the treasure at public sale. The impression is given that it has been in the family for generations. In some European countries there is a legal ban against the removal of works of art to other countries, and that also is referred to. By such means the American is given to understand that the owner of the painting is forced to sell it secretly, if at all, and that he is naturally willing to take a ridiculously low figure for it. The rest is generally easy.

The "low figure" may be anything up to $10,000. When the American has paid over the amount he is urged to keep quiet about it, and he generally does. Often he never discovers the deceit. In thousands of American homes such frauds are proudly displayed as treasures of the world's art. If the owner, generally by accident, discovers that he is cheated, in the majority of cases he is quite willing to keep his loss to himself rather than to endure the publicity of exposing the thieves. He feels that to do so will make him a laughing stock, so he pockets his loss, disposes of the painting and tries to be more careful in the future.

When the forger deals with a man who has learned something about art and has become more or less noted as a collector of paintings he uses different methods, and better imitations. Some of the latter are extraordinarily well done. To unload them on the unwary collector it is not unusual for a group of swindlers to plan and execute a campaign lasting for many months and extending halfway around the world. It begins generally with the announcement in some obscure continental city that a long-lost masterpiece, or some hitherto unknown work of a great master, has been discovered. The announcement is never made until some expert has been found who is willing to declare it genuine for a share of the profits, or who is really deceived by the painting. It is then easy to get the approval of other experts.

One need not wonder at that. It is merely a matter of self-protection. *The expert earns his living, directly or indirectly, through the circulation of works of art. If the extent of frauds should be generally revealed and admitted, a condition would arise in which even the most careless collector would refuse to take the risks of making any more art purchases.* Likewise, even the best of the experts is likely to make an error. When one has approved a painting the second to whom it is shown hestitates to denounce his colleague, fearing to make an enemy who may have it in his power some day to discredit him. So the main thing for the forger is to take due care in the preparation of the "documentary history" and false affidavits that generally go with such a fraud.

When the proper publicity has been given to the "discovery," customers are not wanting. Nearly all the large American collectors have agents in Europe constantly on the watch for works of the great masters. Disposal of the forgery at a high price is easy. If necessary the swindlers send it from center to center, gathering credentials as to its genuineness, and finally ship it to an American dealer, who offers it for sale.

Sometimes the "discovery" is made in this country. A few years ago, for instance, a group of forgers executed a clever trick to get publicity for a fake masterpiece. The forgery was covered with a cheap watercolor, so carelessly that the oil painting beneath could be detected. Customs officials became suspicious. They easily obtained an artist to clean off the water color, revealing a supposed masterpiece beneath, on which

the swindlers were forced to pay a high duty. The resultant publicity of the supposed attempt to smuggle a masterpiece into the country under cover of a daub brought many inquiries, and finally the painting was sold at a high figure.

The uninitiated may think that only novices in art matters are taken in by these frauds. But the fact is that virtually all collectors are swindled at some time or other. Of course, the owners of noted art galleries never admit it. The facts come to light after their death. It was not until John G. Johnson died in Philadelphia that the extent to which he had been victimized became generally known. Then it was learned that when the famous lawyer and art collector found that he had been swindled it was his custom to cut the forgery from its frame, roll it up and thrust it into the furnace of his home. He did that on several occasions until he hit on a better scheme. In his later years he bought only under a written guaranty, backed by financial responsibility, and subject to the approval of Professor Pasquale Farina, noted restorer of paintings, who had charge of the Johnson collection.

It was Farina who revealed the fakes in the Johnson and Wilstach collections of Philadelphia. In the possession of that expert now there are several examples of the more clever forms of art forgeries, some of which came to him from the collections of other noted Americans. A specific example to be described in these articles is from a Chicago collection. Another was bought by a Cleveland millionaire. The fakes were discovered when the restorer was called in to examine paintings that had been bought at fabulous prices. He is, of course, bound in honor not to reveal the names of the victims who are still living.

A remarkable thing brought to light by Professor Farina is that real masterpieces painted not later than the eighteenth century never lose their brilliancy. The reason is that the old masters used natural earth colors, instead of the synthetic paints that have come into use since then. Some of the self-styled art experts of Europe disagree with that contention, because it makes the forging of paintings extremely difficult. But the proof is to be found in many of the greatest galleries of Europe, in South America and in this country, where Professor Farina has made restorations. Colors of the ancient paintings in these collections, which will be described in more detail later, are far more brilliant than those given by modern paints. The flesh tones particularly are remarkably lifelike, with a glow that is now a lost art.

The reason why this discovery makes forgery hard is because those who are in the business of selling fakes to rich men have labored for years to create the impression that a genuine old master must be dim with age. That impression had its origin in a perfectly natural way, but it has been turned to the advantage of the forgers. Long before America was anything but a wilderness, great painters flourished in Europe, and particularly in Italy. Their work and the work of their students was bought by the wealthy families of the day, when it was not made specifically for churches and cathedrals. For centuries these paintings were considered unimportant.

Must Be Dim, Forgers Held

IT WAS not until well along in the nineteenth century that the craze for collection was fairly well launched. By that time most of the really famous paintings were in European museums, churches or the homes of rich families. When high prices were offered the owners sometimes sold, but before long the supply was not equal to the demand. Agents of the art dealers scoured the cities of Italy and the rest of the continent, picking up the work of pupils of old masters, many of whom soon became famous. As a rule they found that these paintings had not been cared for. They were thick with dust and varnish.

When the increasing demand brought the forgers into the field they were quick to hold that a really ancient painting must be dim with age. It must have what they called the "golden glow" which was and is easily applied in the form of many coats of varnish and wax. It must be cracked, as the old painting that has not been cared for is cracked. If the paint was chipped away in small spots at the sides and corners, revealing aged canvas beneath, all the better. The paint itself must be hard as stone, so that it would turn into dust if bored with a needle. And always it must be shown in a dim light.

The forgers found it easy to supply all those demands. If they could not find an ancient canvas containing a picture relatively worthless over which to paint a fake masterpiece, they could and still do treat new canvases with chemicals to make them look old. By many experiments they learned that new paint could be hardened by indirect heat so that it responded to the needle test the same as ancient pigments. Forgeries were literally roasted for days. That also produced the cracks. *The fact that the edges of the cracks turned inward, while the cracks of age on a painting invariably turn outward, meant nothing to the forgers because they knew the buyers did not know the difference.* Soon the business of forging paintings on canvas developed into an art.

Painters of great skill but without creative genius fell into the business of copying old masters. It offered ready money and less thought than original work. The method was to select some known example of

Left—"Youth and Love," by Carlo Dolci, 17th century Florentine master. Right—The same painting after the fruit and flowers had been cleaned away, revealing the head of John the Baptist and bringing to light Dolci's noted masterpiece, "Salome with Head of John the Baptist," that had been lost for 200 years. A forger covered the head because he thought it might be too ghastly for his rich customers.

the work of a famous artist which could not be bought, preferably something owned privately and not subject to public view. By some means the artist gained the opportunity to study the painting and to make sketches of it. Then he applied himself to all the publicly owned works of the same painter. It is not uncommon today for a forger to spend many weeks with a microscope, studying such works, noting the characteristics not seen in the paintings of others, the thickness of pigment, the length of brush stroke, and scores of other details familiar to the professional. When he has finished his study he can make a copy which is a replica in everything but the spirit that was the sole possession of the original painter.

In another type of forgery less skill is required. It concerns the primitive, made in the thirteenth to fifteenth centuries on wooden panels. It is no trick at all for the clever painter to copy one of those early works of art, made in the days when the first of the Italian masters and writers and musicians were leading Europe out of the long period of the Dark Ages. The real difficulty is in giving the panel the appearance of age. That is done with acids and at times with buckshot, to produce "wormholes." Heat is applied to form the cracks, as in forging canvases. The work is so easy that few really good forgeries are made. For instance, woodworms never have been known to eat through pigment. In all the authentic examples of such panels the wormholes stop at the paint. But the forgers frequently shoot holes through paint and all, and still are able to find buyers who will pay $300 to $1,000 for their fakes.

Fake masterpieces painted over old canvases containing studies or sketches by pupils of great early painters are numerous in the galleries of American collectors. The late P. A. B. Widener, traction millionaire of Philadelphia, gathered a collection that was said recently by a noted European expert to be one of the finest and most valuable in the world. Yet there is no question that he was frequently the victim of swindlers. Only a short time before his death he forced a dealer to take back a group of paintings the purchase price of which was $750,000.

Death Brings Out Fakes

AFTER the death of a collector the truth often comes to light. Photographic copies shown herewith illustrate how the late John G. Johnson was swindled. It is easier to get at the facts when the collection is left to the public, as is the case in this instance. Mr. Johnson left thousands of paintings to the city of Philadelphia. In addition, during his lifetime he donated many valuable paintings to the Wilstach collection in Memorial Hall, Fairmount Park, already owned by the citizens of Philadelphia. Elimination of paintings from such a collection becomes a matter of public knowledge.

One example was purchased by Mr. Johnson as the work of the famous Van Dyke. It was a likeness of King Charles I of England. So expertly had the forger copied the work of the master that it fooled many of the leading experts of Europe. At the time it was purchased Mr. Johnson had learned some of the tricks of art swindlers. He bought it only on the recommendation of men who were supposed to know. Before the purchase was completed it was viewed and examined by many of these men, and sent to a number of continental cities for the examination of others who were unable to spare the time to visit the painting. It should be stated that Mr. Johnson was a great lawyer. He was known for a dozen years before his death as the leader of the American bar. Big corporations sought his opinion on matters of the utmost importance, and many a merger was put through only after he had approved the form of its organization.

But some years after the supposed Van Dyke was given a place of honor in the home of the Philadelphia collector, by that time himself an expert in masterpieces, he learned that his legal knowledge and his caution had been of little value in that particular purchase. Mr. Farina discovered that the painting was not a Van Dyke. Not only that, but he convinced the attorney that he had bought a fake, a far more difficult matter. As far as his own knowledge was concerned, Mr. Farina had only to make a microscopic examination of the paint. By so doing he discovered that the "Van Dyke" was done in synthetic colors; the product of the chemist's laboratory. He had already learned that synthetic colors were not used prior to the nineteenth century; that their first general appearance in paintings by masters was not until about the year 1840.

Sir Anthony Van Dyke, the famous Flemish artist, was born in Antwerp in the year 1599 and died in 1641. He could not possibly have painted the picture bought by Mr. Johnson. To prove that to Mr. Johnson, without going into a long dissertation on the difference between the natural earth colors used by Van Dyke and other early masters, Mr. Farina removed a little of the paint from the supposed masterpiece, sufficient to show beneath it a different figure. He was then able to demonstrate by means of the microscope the difference in the two kinds of paint. Synthetic paint is a complete chemical combination. If it is properly mixed it is what is known as atomically green or red, or yellow, as the case may be. Even when one of those colors is mixed with another to form a different hue, the mixture is a combination. But where elemental paints are used, the colors, even when mixed, retain their individuality.

It was possible for the collector with a microscope to discern the blend of colors used in the original painting to produce a certain tone, whereas he could not so separate the tones of the supposed Van Dyke. So he ordered Mr. Farina to clean the whole canvas. Mr. Farina removed the "Van Dyke," to reveal the portrait of a courtier of the period, unsigned. The general similarity of the two heads is only another indication of how patiently the art fakers work. Doubtless a long search was made to find a painting that would provide an easy foundation on an ancient canvas, for the spurious Van Dyke.

Work of Van Dyke Pupil

AT ANY rate, examination of the original painting soon showed that it was the work of a pupil, perhaps of Van Dyke, certainly a follower of the school founded by the noted Flemish master. It was a work that in the opinion of Mr. Farina and other experts betrayed talent, knowledge of draftsmanship, but not anything like the genius of the master. The age of the original was established by the enduring brilliance of its colors. Synthetic paints fade as chemical action takes place, but the early natural colors already had gone through that process of change in the crucible of nature, and they are everlastingly brilliant.

Another example was purchased in Austria in 1848 as the portrait of the Duchess Visconti. It was bought as the work of Il Bronzino, which was the name given to Angelo Allori, the Florentine painter born in the year 1502, who was chiefly noted as the favorite pupil of J. da Pontormo, but who was recognized in his own right and who painted such noted men of his day as Dante, Petrarch and Boccaccio. The portrait was brought to this country and was inherited by A. H. Lea, a wealthy Philadelphian. It was painted on a panel 31 by 40½ inches. In May of 1914 it had become so dark, dull and foggy looking that Mr. Lea decided to have it cleaned. He sent it to Professor Farina, who discovered that it also was done in synthetic paints.

Before Professor Farina was half finished it was evident that he had come on a work of real artistic value. When the cleaning was complete it revealed what was evidently half of an original representation of the martyrdom and miracle of St. John the evangelist, who was pitched into a fiery cauldron. The work is excellently done, and although the name of the artist is not known, the half-painting is treasured by its owner as of far more value than the fake Bronzino.

This example more than any other that has ever come to light betrays the wanton character of the swindlers. In their search for an ancient panel they came across the picture of the miracle. The fakers deliberately cut the panel in half and painted over one of the halves the fake Bronzino. Unquestionably the other half was used for a similar purpose, and some day may be brought to light under another fake painting attributed to some famous master.

Mr. Kingsley "Answers" Edison

PRESIDENT DARWIN P. KINGSLEY, of the New York Life Insurance Company, has made public reply to a financial questionnaire published by Mr. Edison some weeks ago. In it he denies that the use of gold as money adds to its value, and that error is practically the basis of a dogmatic harangue covering several columns in *The Insurance Press,* which carries the reply *in extenso.*

THE DEARBORN INDEPENDENT has no desire to enter the controversy beyond calling attention to the fact that the foundation of the argument being unsound, the disputant fails to win his case.

Gold is money because the law says it shall be money. The demand for gold as money must certainly add to whatever value it has besides. Deprived of that demand, as it might be if any other commodity should be selected in its place, it certainly must fall in relative value to all other commodities.

Fortunately, the United States presents ample proof of this fact within the span of President Kingsley's life, in the demonetization of silver. He will not deny that silver, which had been at a parity with gold at the coinage ratio from the establishment of the United States until the time of the "Crime of '73," at once dropped to half its value as compared with gold. Had the efforts of New York, London and Berlin financiers in 1857 prevailed, the situation would have been reversed. If today platinum should be adopted to succeed gold, silver would have a yellow companion in its depreciated company.

President Kingsley is head of one of the most important insurance companies in the world. That company doubled its holdings by the demonetization of silver, as did every other company in the same business. Mr. Kingsley has enumerated the reasons gold has been selected as the money base. But platinum is as much better constituted than gold as gold than silver. In every quality it is superior in all respects. Evolution, if the quality of redemption in any commodity in money is to be retained, must some day select the finer metal. Under any logical succession of events gold is doomed.

What President Kingsley says of the stamp of the mint is an actual truth. It is a certificate of the amount of pure metal in a coin, not after it has been in use, however. If any coin shows abrasion by wear or sweating or clipping to exceed a certain per cent of its proper metal content, the mint stamp is no longer the certificate of weight and the coin is no longer money.

The United States owns no gold. It has set a price on gold and that price does not vary and will not vary unless Congress enacts another. That price is $20.67 an ounce. There is hardly enough gold in the whole world to redeem the paper currency of the United States, and every dollar in circulation that is not a representative of so much gold or silver, lacks the backing of those metals.

Yet the money of the United States is sound, as President Kingsley claims. Its soundness, however, does not depend on the 40 per cent of gold (in proportion to volume of circulating medium) held by President Kingsley and his Wall Street coadjutors, *but by the faith and credit of the people of the United States,* who, through their representatives in Washington, have declared that every dollar issued by their authority is a full legal tender for all debts, public and private.

President Kingsley's talk of an international value to gold is mere prattle. Gold is worth in any country *just what that country will pay for it,* just as is the case with any other commodity, with this exception, that the gold in the United States is not the property of the United States but of the Money Kings, and if we must borrow we must expect to pay their price.

The Cut in Freight Rates

THE Interstate Commerce Commission has ordered a ten per cent cut in railway freight schedules. It is not a very great concession to public demand, but it is something. That the result will be an increase in net earnings by the roads would not be strange, since any increase of business can be accommodated without increase of expense.

The cut, however, is not deep enough. The claim to returns on investment is extravagant, for investment actually is smaller than capitalization. It is estimated that about one-half of the capitalization of the railroads of the country is water. That can best be determined by a careful estimate of the cost of physical reproduction. It is known that the big transcontinental lines were built more to enrich the projectors than for public service at reasonable rates. It is also known that in other ways the manipulators of railroads have used them more for stock-jobbing than for their legitimate purpose, and that "Big Business" is the profiteer. The values in shares held by small holders vary, but rarely will a case be found where the investment has been at par. A small holder of stock bought at say half its face value is as clamorous for full returns on his investment—six per cent on its face value—as if it had cost him the full amount.

The effect on the labor situation remains to be seen. It should have none. The addition of one car of freight to each train, either in local or through service, will take care of the ten per cent cut and the entire wage cost of the train. This can be demonstrated by taking the charges for carrying one extra car for the distance run, the cut in former rates and wage cost of that car. Take from the earnings the two latter items, and the net remainder will be larger than many would imagine.

The action of the Interstate Commerce Commission is praised, but if it had been taken a year ago, whatever benefit it may show would have been proved by this time. But a year ago the commission was of the opinion that rates must be higher or the railroads would lose money. Even later voluntary reductions in some classes were denied permission.

Comparing Prices

A STRIKING comparison is made by *The Retail Lumberman,* of Kansas City, in a specimen advertisement suggestion to its patrons. Illustrated with cuts to visualize the comparison, the text reads:

> Ten hogs—average 250 pounds each—one year ago would have brought this amount of material —today will buy the same amount of material and this much more.

"This" was pictured as 1,000 feet No. 2 boards, 2,000 shingles, 500 feet first-class oak flooring and 500 feet wall board. "This much more" is represented as two squares roofing, 2-5 X panel doors, two gallons paint, 1,000 No. 1 lath, 50 pounds nails, 15 sacks cement.

The comparison of relative prices is an appeal for the farmer to go on with his building operations, but is not so genuine as it looks. One year ago the farmer had taken his loss on pork, but lumber and building materials had not fully done so.

That Little Toe

SCIENCE seeks to develop a cornless foot by amputating the small toe, which pedologists assure is absolutely unnecessary, and has no function in fashion or fact.

Chiropody dignifies itself with associational meets, at which corn doctors look wise, even if bored, and listen gravely to discussion on the ills to which the physical human understanding is heir. One of these meets was held recently in Chicago, and the most discussed paper on the program was one advocating the Cinderellizing of the feet, especially those of the women. One reason given was to conform the foot to the lines of the modern shoe. Formerly, to have met this end, the foot would have been trimmed on both sides, the great toe being a bunion breeder because the shoe was pointed to a center. Styles change, and the straight line inside of the heel and sole permit the great toe opportunity to work.

Fashionable women have been known to undergo small-toe amputation, and to advise their friends to do likewise, but this is the first time the profession has underwritten the idea.

The Keynote: Fewer Words

ARE facile tongues and powerful vocabularies necessary to high office in the United States?

The majority of men who have held high executive, legislative and judicial places have been public speakers. And the present generation in office seems to believe that oratory is a duty they owe to the public and some of them give little more than oratory in return for the offices bestowed upon them.

The parliamentary system of government which grew up in England and was passed on to America has produced much public speaking. In this country, lawyers, perhaps more than any other type of man in business or professional life, have been the seekers after public honors, and lawyers as a part of their profession are users of words.

The early days of the Republic required definition of the aims of the government, and the debate over the formulation of national policies naturally brought public speakers to the fore. Following the Civil War, the wide development of the spread-eagle oratory which fulminated on patriotism made the candidate with a "gift of gab" the most successful.

During the last few years, the general public has become more and more disgusted with public servants who believe they are called upon constantly to speak their platitudes. Men in public office apparently have not sensed this change in heart, and still the *Congressional Record* is crammed with thousands of thousands of words devoted to proving that the particular statesman who has the floor loves his country dearly.

It will not suffice longer to express love for the "dear peepul." Much language will no longer excuse little work. The country is demanding service from its statesmen. It would doubtless be quite reconciled to undergo an administration utterly barren of oratory.

Paying Debts in Straw

AN INTERESTING item, credited to the *Wall Strcet Journal,* is going the rounds of the press, calling attention to the large importation of straw hats from Europe, and suggesting the appearance of making good on war loans in trade.

The figure is not so incongruous as it seems. In fact, it is in trade all debts are paid. It was in trade the European debts of this country were contracted, and in the end it is in trade they will be paid.

Direct payment of public expenses involves the levy of taxes. The taxpayer is able to "render unto Caesar" the tribute demanded through his own efforts. Money does not grow on trees or in the fields, nor is it forged in the smithy or cast in the mold at the foundry as money; yet it is land and labor that produce it. Money is thus the representative of production and production, in exchange, is the means of paying all differences of account.

Not all of our exports are sent abroad in boxes and crates. The hundreds of thousands of American tourists in Europe avail themselves of American production for the enjoyment of travel. Their money supplies the exhausted purses of the visited countries, but it is none the less American production exchanged for foreign wares.

Each country is paying its debts in straw.

Cleaning Up Wall Street

THE New York Stock Exchange has closed out more than 150 brokerages in its fight against "bucket shops." In doing so it was surprised to find ten or a dozen of its members mixed up in the outlawed profession, and was forced to discipline some of them. But that did not end the trouble and it looks as if a monopoly in stock gambling is impossible of attainment.

By driving out the "bucket shops" and creating a distrust among out-of-town investors, members of the Stock Exchange itself found their own patrons taking alarm. They might have known that John Jones of Jonesville could not distinguish between a real member of the Exchange and the occupant of a desk in a dark office, if the latter used as good stationery; and that the failure of a Union Investment Company meant to him the smash of a J. P. Morgan & Company.

To add to the confusion the curb papers now report the swarming into Wall Street of many new and irresponsible young fellows, either clerks who had been patrons or former employes of the bucket shops, until there are three or four times as many of the outlawed class as there were before the raid commenced.

It is an odd thing, but these sensitive "Exchange" members cannot see that speculation is gambling until the little fellows try it. The difference perhaps is akin to the difference between poker and "craps."

Meanwhile, many of the "ruined" brokers are executing private commissions for their more aristocratic rivals, residing, the while, in the most fashionable hotels.

Mr. Ford's Page

THE question of Race does not turn upon the point of prejudice but upon the point of knowledge, and it increasingly challenges the thought of the world today. It is perhaps the last of the big social problems in its region; and it is headed straight toward the center of universal attention. There is bitterness and fear and violence and colossal injustice, but these are but the birth-pangs of the greater problem. The world is dividing more clearly along racial lines every year, and the outlook gives the wisest men a solemn pause.

One serious difficulty is the lack of knowledge concerning the races, which scientists cannot too soon fill up. But there is such a hopeless orthodoxy of science these days that it sometimes appears doubtful whether any existing school could competently tackle the problem. There is hope, however, that with the coming of the problem there will also come the mind that shall master it.

We have scarcely met the Racial problem in America at all. The talk about the "color line" is largely personal and local, and does not take in the full sweep of the question. Upon this country has fallen the high task, not of showing as some assert that all the races can live together upon one plane and in one community, but of showing which races can live together, and under what law all races can live prosperously. This nation does not pretend to assimilate all who come, but it does discover which elements are assimilable; and even those strains of blood which *we* cannot assimilate, find in our political ideals the elements which *they* can assimilate and use for their benefit elsewhere. Perhaps, in our thought of immigration, we forget the hundreds of thousands who arrive, live here awhile, and pass on again, carrying into other parts the elements they assimilated here.

The world has been in flux; the people have been flowing through the Americas; now there appears to be a great swarming of the peoples nearer their home hives. The races are drawing apart and race consciousness exists with an intensity that only marked caste consciousness before.

We have learned that national divisions do not really mark off different peoples. There are racial similarities which extend beyond and include many national boundaries. That is to say, national names do not indicate different breeds of people, but often the same kind of people making their political experiments under different forms in their own lands. We have learned enough to know that the Saxon is one whether in Germany, France, Great Britain, Scandinavia or America. A score of national political divisions may mark the people of this single blood-stream.

It may be likewise with race. Some of the divisions which we may think are racially alien may not be so at all. The accidents of color, in some cases, may not be indicative of racial differences. There may be a wider unity than we have supposed, and our false suppositions may be due to the incomplete state of human knowledge about the beginnings and wanderings of races.

A sufficient ground exists for thinking that there may be but two distinct blood-streams in the world. Human history, checkered with various names, may be but the reappearance of the same blood-stream in various countries at various times, now in Persia as Persians, now in Greece as Greeks, now in Rome as Romans, now in Britain as Britons; now in Babylon, now in Prussia, now in France. Where has the greatness of old nations gone? Did it evaporate into thin air, or did the racial element which created the greatness move out toward the west? The countries remain and go by their old names, people remain in them in whom we try to see the descendants of great races, and fail. Where has the great race stream gone? Did it move out on its mission to touch all the world with higher ways of life?

THE superior race is superior only in its qualifications to serve the less developed races. That is the only reason for superiority anywhere. And when dominance is used for selfish exploitation, or when it ministers to narrow pride, it brings its own troubles on its head. The Race Question is a real question. It grows more and more challenging. But its solution is not impossible. We need knowledge that will give us the racial facts. But we need most of all to learn the obligations of superiority. Every race cannot be assimilated, but every race can assimilate enough to develop a full life for itself.

There goes with this, of course, the proposition of a dominant race. This is the red rag of the whole question. That there is no dominant nation and no dominant political idea, everyone will agree. But that there is a dominant race manifesting itself in most of the nations, and in the world at large, seems to be an inevitable conclusion. It is possible that when history is well enough known to be correctly written we shall no longer be reading of "the rise and fall" of nations, but the arrival and departure of dominant racial elements in the now historic parts of the world. And, to complete the thought, it is not improbable that we shall ever again read of "the rise and fall" of nations, for now the dominant strain seems to have found its own place in the world, from which, henceforth, it will carry on its work.

It is not to be supposed, however, that present racial designations will be found accurate in describing the dominant race. A great deal of prejudice and some misfounded pride will fall before the facts. And it may be that dominance will have to be proved in ways not at all thought of now.

The one central truth omitted from all discussion of the dominant race is this: that dominance is an obligation. The whole solution of the race question, as of every other, lies in the stronger serving the weaker, the abler serving the less developed. The dominant race has not learned that lesson and may have to learn it through severe suffering. Just now there are dangerous agitations here and there among people whom the dominant race has not served as it ought. The protest of a less developed people against the selfishness and pride of the more developed people is well-founded and will be heard in the universal court of the justice of God. It is impossible for the dominant race to regard its blessings as an excuse for exploitation, without suffering the penalty. The penalty will not be the loss of dominance, for that is probably irrevocable; but it will be the serious consequences of a violation of the eternal law. The superior racial stream was equipped for the service of the others, not for exploitation and suppression; and until dominance comes to be superior obligation to service we may expect the confusion to deepen.

The whole matter is to be considered broadly. Even among the races called "inferior" (there ought to be a better word) individuals appear who are the equal of superior individuals of the dominant race, who stand as prophets between the peoples. Dominance does not mean at all the dominance of individuals, but of the racial movement and meaning and work. There is no room for pride at all; there is wide room for serious consideration of duty.

A mushy sentimentality, a "brotherhood" of words which does not emerge in action—these are not necessary at all. What we need is to see that one strain is equipped to do for the other what it cannot do for itself, and set it upon the road of living a life which fulfills its destiny; and the strain equipped to do this must do it, or suffer the consequences of neglected duty. These consequences usually come through the reactions of the very people whose welfare has been destroyed for gains of our own. There is something deeper in race riots than the mere clash of color.

There is time for the world to be wise. And wisdom will not be found in soft words, but in truth.

There has been too much agitation by our "international" groups of the idea that any race can become superior by the simple devices of conspiracy and violence. And there has been too much cocksure contempt among the "intellectuals" with regard to the whole question. Here is a task which will reward research and which will need the sincerest application of sound thought and good will.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

Minnesota—the Land of Ten Thousand Lakes

How One State Is Capitalizing Its Great Water Resource

By EARL CHRISTMAS

MINNESOTA has known about its lakes for a good many years. It could hardly escape it. Sprinkled over the state, there are thousands of beautiful lakes. The Geological Survey puts the number at "upward of ten thousand."

Minnesotans are not particular about the number. They speak of them as Minnesota's Ten Thousand Lakes. As a matter of fact, there are more than that. How many there are, no one knows, but ten thousand have been charted.

In the multiplicity of its lakes, no other state can compare with it. Minnesota contains about 53,943,000 acres, and of this fully 3,608,000 acres are water. From the peaceful farming country in the south to the pine woods along the international boundary, the lakes are to be found. Sometimes, it is only an occasional lake among the farms. Or it may be a whole chain of lakes, a seemingly interminable chain of them, in the woods.

The very name, Minnesota, has to do with its lakes. The name is derived from the two Indian words, "Mini Sotah" (Mini, water; sotah, sky-colored) signifying "sky-tinted water."

Now Minnesota has been aware of the existence of these lakes for a long time. Every spring sees the annual migration to the lakes. People may live in the cities in winter, but when May comes hundreds of families gather up their belongings and move out to the lakes.

Back in 1917 a small group of men held a meeting in St. Paul and decided to advertise Minnesota's lakes. "We'll sell Minnesota's Ten Thousand Lakes," they said. "Just let the people down in these states to the south know about these lakes, and they will come to Minnesota."

It was difficult to get hard-headed business men to see the value of advertising water, but the plan went ahead. An association was formed, and appropriately enough it was named the "Ten Thousand Lakes of Minnesota Association." A fund was raised by private subscription. In 1918, the campaign was launched through advertisements in magazines, newspapers and booklets. Along in July, men down on the sun-parched plains to the south read the message: "Come to Minnesota—Ten Thousand Lakes are waiting for you."

The atmosphere of the pine woods, the coolness of summer breezes on the lakes and the lure of the fishing haunts were woven into that invitation.

The plan had its expected psychological effect. Thousands of visitors were attracted to Minnesota. The following year, the scope of the plan was enlarged. The Minnesota legislature, deciding that the advertising of its lakes was a state function, created the Minnesota Land and Attractions Board with an appropriation of $30,000 for the next two years.

Since that time, the Ten Thousand Lakes Association has operated under the direction of the Land and Attractions Board. Thus, it is a semi-official institution. In 1921, the state legislature increased the funds of the board to $40,000 for the biennium, or $20,000 a year. Meanwhile, the association continued to solicit funds to supplement the state appropriation. Altogether, last year Minnesota spent approximately $40,000 in advertising its lakes, and will spend about the same this year.

But the interesting thing about all this isn't the method, but the result. Last summer, 300,000 persons from other states visited Minnesota's lakes, and these tourists spent in the state approximately $20,000,000. The figures are obtained from a traffic census taken by the state highway department and from a questionnaire sent to all lake camps and resorts by the state Land and Attractions Board.

The effect of the campaign may be shown most effectively by similar figures which have been gathered for the last six years. In 1916, the number of summer visitors from other states to the Minnesota lake region was 13,000, and the estimate of their expenditures was but $750,000. In 1917, the number of visitors was 17,000. In 1918, the first year in which Minnesota began to proclaim itself abroad as the land of lakes, the number of visitors was 40,000, and the expenditures, figured from the average outlay of a large number of tourists, were $1,500,000. In 1919, the number of visitors was 145,000 and the expenditures $6,000,000. In the summer of 1920, the totals were 200,000 persons and $10,000,000 in expenditures, and last year the record of 300,000 visitors and estimated expenditures of $20,000,000 was reached.

Incidentally, that isn't a bad return for an investment of $40,000. In not many lines, can one get such a business at a cost of two mills on the dollar.

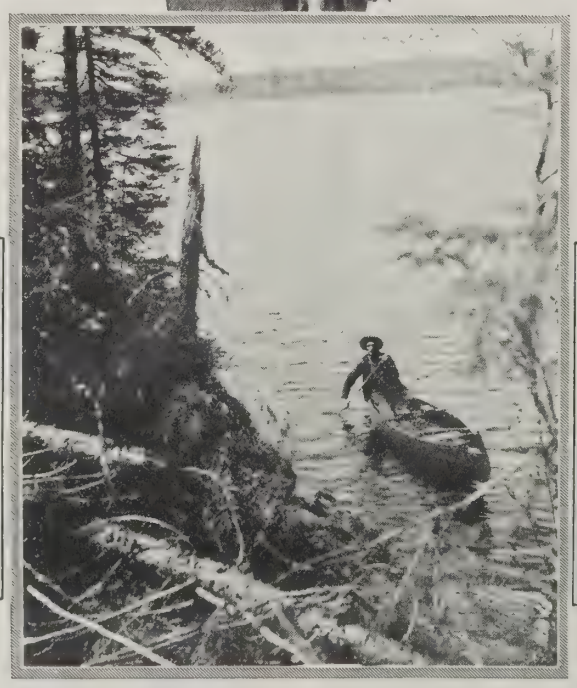
In 1917, the number of non-resident fishing licenses issued in Minnesota was but 9,562. Last year, the number exceeded 25,000.

Visitors came to the Minnesota lakes from every state in the Union last year. Some even came from foreign countries. The heaviest traffic came from the states to the south. The leading contributors were Iowa, Missouri, Nebraska, Illinois, Indiana, Kansas, Ohio, Oklahoma and Texas.

Already, as the warm days begin, the inquiries are beginning to pour in, asking about vacation and fishing places for 1922. Some of these inquiries come from far distant points. South America frequently is represented. The other day, an inquiry came from Esthonia. Another came from Sweden. Another came from the Dutch East Indies. All wanted to know about vacations at the Minnesota lakes.

The majority of the visitors come by automobile. The number runs as high as 75 per cent, according to figures tabulated by the Ten Thousand Lakes Association.

"The visitor is bringing prosperity to the entire population in Minnesota," said State Senator P. H. McGarry, president of the Ten Thousand Lakes Association. "The hotel man, the garage man, the farmer and the gardener benefit. As new money is invested in the state, the merchant, the furniture dealer—the entire community benefits."



Minnesota has every variety of lake, from Lake Minnetonka, with its terraced homes, to the lakes in the wilderness along the international boundary. You may have a lake as far from civilization as you like, or you may have one with all the conveniences of the city at your door.

For those who like the wilder places, there is the great labyrinth of lakes along the northern boundary. This is a wild, uninhabited district, with mountains of rock and hills covered with spruce and pine. Moose, deer and beaver are abundant. The only means of travel through this region is the canoe. It has been described frequently as the greatest canoe country in the world. Hundreds of miles of canoe trails have been marked out. One may paddle for days and weeks and never see a habitation of man, passing on by easy portages from lake to lake in an almost endless cruise.

Farther west on the boundary, is the Lake of the Woods, with its countless wooded islands. Red Lake, in the north central part of the state, is the largest lake wholly within Minnesota. It is 30 miles in diameter.

Below Red Lake and extending down through the central part of the state is another great lake country. It includes the Bowstring country, the lake region along the divide between the waters of the Mississippi and the Rainy rivers, and farther south and west, Itasca state park, a virgin forest surrounding the source of the Mississippi River. Wild rice abounds along these lakes, and aquatic fowl make their homes in their waters. In the western part of the state, is the Lake Park region, a land of numberless lakes, with mixed forests, prairie and rolling hills. But lakes are found in so many places in Minnesota, it seems useless to designate the places. Only in a small area along the Mississippi River in the southeast part of the state are the lakes scarce.

Top—The lakes along the northern boundary of Minnesota offer an endless delight to the man who likes to follow the canoe trail through the wilderness. This is a view on Clear Lake. Center—Twenty-five thousand fishermen from other states journeyed to the Minnesota lakes last year. Bottom—One may paddle for weeks and days through chains of lakes in the wooded hills of the Superior National Forest. This is Lake Insula.

The summer home on the lake front proves inviting when the hot days come. This home is on Lake Bemidji.

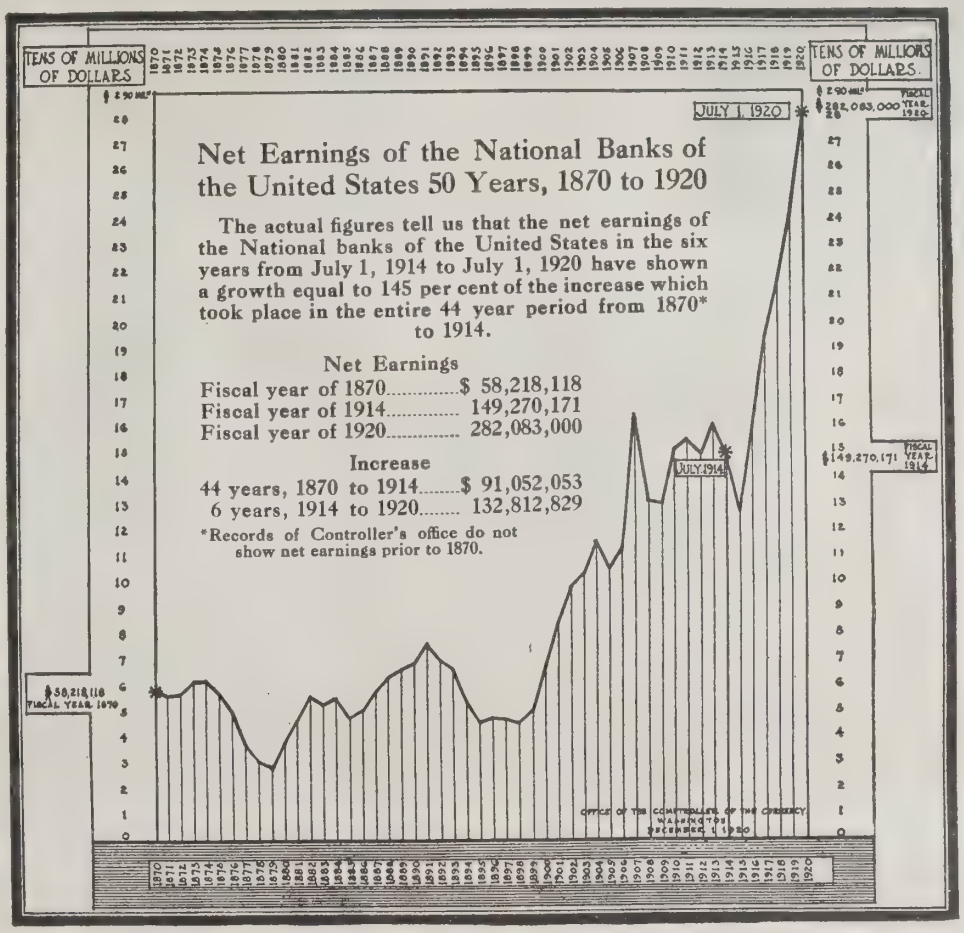
Wooded islands are a feature of many of the lakes in Northern Minnesota. This picture is of Burntside Lake.

John Skelton Williams vs. the Federal Reserve

All the Odds Against Banker's Fight With Powerful Banking Board

By A. R. PINCI

IT IS many years since I have seen Thomas W. Lawson, the Boston financier; it is only a few days since I have stood face to face with John Skelton Williams. These two men have had a common object —that of educating the people to a better understanding of misdirected or autocratic or evil manipulation of private and public funds. Both were participants or witnesses, in given ways, in the acts and deeds which they have wished to expose.



Lawson was the first man openly to challenge the "System," as the anointed and privileged financial group of New York is called; he bandied about in the public prints such names as Morgan, Rogers, Stillman and Rockefeller. Williams has been the first man to expose in detail the methods by which the Treasury Department at Washington played into the hands of that same "System," still controlled by the same men or their lineal survivors.

It is important, however, before proceeding further, to refer to a peculiar trait of what may be termed mass psychology, a trait that is encountered by independent editors and writers. The great public is said to be hungry for facts and not hearsay, records and not imaginativeness, yet when men like Lawson or Williams come forth to say a few things about which they know, and which they believe the public should know, and that the said public could never learn except through them, it is set aside with the feeling that such information is dramatic and interesting, but—

Lawson, as a speculator of great note, was necessarily a clever mass psychologist. Because of that, when he had concluded his recital about frenzied finance he indited, in 1906, this warning:

> I have explained to the readers of this magazine that there is at this moment little more I can do to rouse the American people to a sense of the dangers that surround them; yet until the people are further aroused I cannot disclose to them my remedy. For as soon as it is before the people, all the energies of the "System," supported by untold millions, will be bent to prevent its adoption; and once it is circumvented, it is dead, and for all time.

There is, however, a very great difference between the Lawson and the Williams campaigns *pro bono publico*. Lawson was dealing with private individuals at a time when the money of the people was not supposed to be, as now, under the direct and immediate control of the United States Government. The Federal Reserve System had not been devised. The national Treasury was supposed to be an adjunct of Wall Street. As a matter of fact, analyzing the charges of John Skelton Williams, former Controller of the Currency and ex officio member of the Federal Reserve Board, the Treasury is today an adjunct of Wall Street as of yore. There is, of course, no evidence of collusion, no evidence of double-dealing, no evidence of graft, but there is evidence that the results attained by the Federal Reserve Board, which is all that there is to the Treasury Department, have been of the kind that would have warmed the cockles of the hearts of the most predacious of last generation's famous financiers.

The above chart shows the National banks of the United States for the past six years have shown an average annual increase of $22,135,472 as compared with an average annual increase during the preceding 44 years of $2,069,365. The increase in the past six years has amounted to $41,760,776, more than the total increase which was shown in the preceding 44 years.

WHAT IS JOHN SKELTON WILLIAMS TRYING TO DO?

According to the Federal Reserve Board, he is trying to "prove the impossible but succeeding in convicting himself of inefficiency as Controller of the Currency."

According to Wall Street echoes, he is trying to foment distrust in the minds of the people by accusing others of that which he himself approved as a member of the board.

According to the unhonored voice of the little banker, he is publicly exposing mismanagement.

According to J. S. himself, he wishes to call attention to the fact that the Federal Reserve System is a national blessing, but its mismanagement a public calamity.

"I do say, and the plain facts plainly show, that exactly what the Federal Reserve System was intended to prevent has happened. It is the tragedy of artificial deflation. The collapse in prices of agricultural and other commodities was contemporaneous with the enforcement of the Federal Reserve Board's ruinous policies.

"We have to judge of performance by results. The board simply failed, in my opinion, to measure up to its responsibilities."

So has spoken Mr. Williams. He calls attention—mine, yours, and that of the Congress—to the "important fact that not a single one of the many criticisms and charges which it has been my unpleasant duty, in behalf of our Federal Reserve System, and in the public interest, to make against the administration of the Federal Reserve System has ever been refuted. They stand today unshaken and unshakable."

In several communications to W. P. G. Harding, governor of the board, Mr. Williams called the former's attention that he has made specific charges and complaints against the Federal Reserve Board, and a general denial could hardly be effectual. An analysis of the correspondence reveals that Governor Harding, acting for himself and his associates of the board, has not succeeded in disproving a single statement made by Mr. Williams.

It is no mean fight that Mr. Williams is waging. In fact, it is a tremendous war, bloodless, but nevertheless serious, and with all the odds against him. With the exception of Mr. Lawson, no other David ever ventured forth to smite a financial Goliath. And in this case the odds against Mr. Williams are even more numerous, because Mr. Lawson was sure to find popular approval in attacking the captains of speculation, but Mr. Williams is attacking more than that. He is going after the most privileged official body that is a part of the Government of the United States. Attacks upon a President or a Congress are regarded with equanimity, but going after the official money power is another story. It means going after the best organized system in the world.

Such a duel has its dramatic side. It is entitled to a graphic report. It carries proof that the vested interests of the country have subjugated the Treasury Department despite the Federal Reserve System, through no fault of this system but solely of its bad management.

With this end in view, I called upon Mr. Williams in his offices in Richmond, Virginia, he having resumed after eight years of nearly thankless public service his former pursuits in banking. For Mr. Williams, by the way, is one of those rare individuals who was appointed to office with a substantial background of constructive and related experience. For more than 25 years he was a director, vice-president, president, or chairman of trust companies and banks, both National and State in the South as well as in New York City. That his colleagues thought well of his ability is proved by his having been a member of the executive council of the American Bankers' Association.

He planned, organized and was president of the Seaboard Air Line System, operating approximately 3,000 miles of railroad. After a separation of three years or so he was urged to manage it anew, following difficulties traceable to the panic of 1907, and when the credit of the railroad company was fully restored, Mr. Williams retired again. This was several months before he was called to Washington by President Wilson and Secretary of the Treasury McAdoo.

In order to plumb thoroughly the exact official status of Mr. Williams—that is, the status exceeding the routine capacity of the office of Controller of the Currency—it is well to remember that President Wilson had some radical but thoroughly formulated ideas about the control of Wall Street, and his own selection of William Gibbs McAdoo as Secretary of the Treasury was due to his desire to take away from New York its hitherto unlimited financial power. Mr. McAdoo was no friend of professional metropolitan bankers and these were no friends of his. The next officer in importance in the Treasury was selected with a view of synchronizing, as it were, this feeling, until it would mature into legislation.

Now, to cover much ground in a few words, Mr. Williams' troubles with the Federal Reserve Board did not begin until after Mr. McAdoo had resigned as Secretary of the Treasury. It is perhaps true that the economic situation was still one of inflation at the end of 1918, but certain Wall Street bankers had not, despite their over-emphatic co-operation with the Liberty bond issues, attained the inner mastery of the Secretary's office, or that of the Controller of the Currency, which, of course, as then constituted, meant the Federal Reserve Board. Governor Harding in those days was the routine executive officer of the board, but he was not its master, as he has since become.

The opposition to John Skelton Williams as Controller of the Currency was ever formidable, but it did not exert its efforts against him until Mr. McAdoo resigned. Had any lesser power than President Wilson himself stood behind him his official head would have fallen in less time than it takes to tell. Upon the termination of his second term as controller, Mr. Williams was reappointed by the President and the nomination favorably passed upon by the Senate Banking and Currency Committee, but action in the Senate was prevented by a filibuster in the closing hours of the session. The renomination was sent by the President to each succeeding session of the Senate. The Republicans being then in control of the Congress, by a strict party vote the Senate Committee refused to report favorably. However, no unfavorable report was made. For about two years Mr. Williams was controller on the sole say-so of President Wilson.

It became known afterward that Senator McLean, chairman of the Senate Committee in question, agreed that Mr. Williams had made a good controller, and that, as far as he was personally concerned, he would be willing to report the nomination favorably and have it confirmed, but *that he had promised some one outside of the Senate that he would not do so,* and was therefore restrained from favorable action. *If the gentleman to whom he had given his promise would release him* he would make, in behalf of the committee, a favorable report!

For two years, therefore, Mr. Williams kept at his work in the face of growing and sometimes irritating hostility. Representative Carter Glass and Secretary of Agriculture D. F. Houston, successively secretaries of the Treasury, despite their being Wilson men, had little sympathy for the controller. Senator Glass is one of his bitterest opponents. Mr. Houston, now identified with Wall Street as the executive of one of its richest corporations, sits aloof in superior disdain. Both were and are "financiers" but neither is a banker except in an academic sense. In the office of Secretary of the Treasury the incumbent with a little theory is a dangerous official. With the retirement of Paul M. Warburg there remained no practical financier on the Federal Reserve Board except Mr. Williams, because "Piggy" Harding, as he is known in Alabama banking circles, is a routine small-town banker of the subservient type: this is to say, subservient to metropolitan banking.

Mr. Williams belongs to the constructive school. He is also a plain-spoken man, and it is this plain speaking that has made him the opponent of the Federal Reserve Board. It is true that he was a member during the period about which he complains now, but it must not be overlooked that Mr. Williams had the supervision of 8,000 national banks with 20,000,000 depositors, and that he was primarily Controller of the Currency and only secondarily a member of the Federal Reserve Board. The Secretary of the Treasury did not sit with the board very often, and Mr. Williams, with enough other work to keep him busy, had no time to attend meetings that dealt solely with routine matters. And the members of the Federal Reserve Board have been tempted to consider their meetings as of transcendent import; to the other members the absence of the "Controller" was unforgivable. What was his office anyhow? And that this disdain of the ancient office is not mythical may be read in a letter by Governor Benjamin Strong, of the Federal Reserve Bank of New York, to W. P. G. Harding, in which he asks why the office of the Controller of the Currency shall not be abolished, and if not, whether it may not be made subordinate to the Federal Reserve Board.

Saving Mountaineers From Blindness

Dodged Washing the Teacups and Found Her Mission

By HENRY DE QUESTIER

Miss Neville and one of her charges.

FAR and near in the mountains of Kentucky, Miss Linda Neville is known as "that 'ar lady who takes keer 'v th' cripples, an' th' blin' bratzes," the last word being primitive mountaineer for children. "Blin' bratzes," for the most part, whose shoulders are being warped out of shape, because day after day they keep one arm crooked over their eyes to shut out the light. They're well on their way to total blindness, and little or nothing is being done about it by their parents.

"It is an absolute failure to understand conditions in the mountains," Miss Neville says, "that makes writers think heartlessness is at the bottom of this want of medical attention. Remoteness is one reason for this. Remoteness that is overwhelming. Roads are absent. Mountain counties are very poor. Their population is scanty. Property values are low, in spite of the wonderful resources, because there is no way to get money out of the resources—no railroads; no roads. Aid in building roads is of little good, because the counties can't pay their share of the cost.

"And, these people are not shiftless. When the young men and women get an education at all they go away, because their sense of ambition cannot be satisfied there, and these counties are emptied of those who could do big things. People are going blind there all the time, for if they cannot pay their taxes, how are they going to pay for medicines?

"There is one county without a bridge in it. To reach it from the railroad you have to cross a river, which rises rapidly.

"Now, all the affection of its parents is of no assistance to a child who meets with a serious eye accident in that county. There is but one doctor. I remember one little girl who injured her eyes. She lived far back. There was no delay in sending for the doctor, but it was 20 hours before he could get there. He did the best he could, but he was a general practitioner—not an oculist. His help came too late—the little girl was totally blind in five months."

There you have the main reason blindness amounts to a plague in the Kentucky mountains. Another reason is that blindness actually is accepted as a plague by a type of illiterate highlanders, whose biblical lore is a second-hand, hell's-fire-and-brimstone variety.

"Fer haint hit a jedgment sent down by th' Lord," these highlanders argue from what they've heard, "an' haint hit a-strikin' people ever'whur? Hit is a jedgment."

There is no way of telling how many men, women and children responded to this talk, and "jes' set down fer t' be blin'." Mountain religion is harsh. They were "stricken," and that settled the matter.

Trachoma, a disease of the eyelids, is the great menace. Unless something is done to check the disease, 75 per cent of the cases cause total blindness. The remainder seriously impair vision.

Hill mother on her way back home with her purchases in a "poke."

There was so much trachoma in Kentucky mountain counties that a few years ago the Federal Government investigated. Twenty-five cases were discovered in a single group of 100 persons. Several counties showed from eight to ten per cent of their population afflicted. Since then the United States has set out to eradicate it.

Victims of trachoma suffer a great deal of pain. They are extremely sensitive to light. In its first stages, trachoma is curable with commonplace treatment. Even when it has gained considerable ground, treatment will relieve it. The disease has made terrific headway in the Kentucky mountains, because there has been no treatment. Trachoma is highly communicable. Big families live in one and two room cabins, with perhaps a lean-to. These highlanders do not know how to prevent the disease. Victims let it run its course, and passed it on to anybody who happened to be around. Naturally, it spread.

For a decade and a half Miss Neville has been searching the Kentucky mountains for trachoma victims, whose vision might be restored, or benefited. She has overlooked no victims of other diseases.

The people Miss Neville looks for she is likely to come across at any distance, from 10 to 50 miles, from the railroad — and a good many times the railroad is a logger's line, or one built to bring coal out to the main line of a through route. One coach carries the passengers. The coach is at the end of a long string of flat and coal cars, and the journey is a bumpy, jerky one.

A "jolt wagon," drawn by mules, is the customary vehicle into the heart of the mountains. Its route is over rocky beds of dry streams, and across rutty trails. When the wagon can make no headway, Miss Neville rides a mule. Because she is "plum common," in the vernacular of the mountains, which means she is not "plum stuck up," Miss Neville always is welcome to "stop an' light, an' take a night," in any cabin between Sore Heel Holler and civilization.

Miss Neville's journeys are businesslike. She scrutinizes every person she meets. She is not a doctor, but she knows the appearance of eye diseases. When she meets any one with "troublin' eyes" she gets the promise of the victim to go "outside" to Lexington or Louisville for treatment. Whether or not she finds trachoma victims in mountain homes, she stops and talks about the disease and its prevention. She lectures in schools, talks to school teachers, visits the jails and the poorhouses, carrying on a continuous campaign of education. And she always is on the lookout for crippled children to take "outside" for treatment.

Miss Neville meets her charges at the railroad. Getting them there isn't always an easy matter. One crippled boy lived 20 miles from the railroad. The start was made in a wagon. Before the first mile was covered, the jolting was too much for the boy, and a stop was made. The boy was placed in a chair, and two men carried him to the next cabin, where two others quit their work and started on. The boy was relayed from cabin to cabin to the railroad, over 19 miles of the roughest mountain trails.

It's a grim job, this taking at one time as many as seven or eight crippled and blind—men, women and children—to the "outside." The latter is a mysterious region. Many of the charges have never been away from home before. Timidity and joy are mingled. "Mountain folks" enjoy the train ride—the first in their lives. On the train Miss Neville is kept busy. She carries disinfectants, and watches to see that no passenger can possibly become infected. Once, she brought out, with a few other children, a baby. She carried it in a basket. The baby was alone in the world. It had been given shelter in the poorhouse. There Miss Neville found it, secured permission from the county judge to take it "outside" for treatment it needed, packed it in a basket and brought it along.

In Lexington, and in Louisville, Miss Neville has free beds in hospitals, and surgeons and oculists who make no charge for their services. Occasionally, she takes children to her own home, until they can be hospitalized. If clothing is needed, Miss Neville turns dressmaker.

"One little girl, whose father and mother were dead, stayed with me for 10 days," she said. "She was a cripple. Under orders of the county judge she had been living at the poorhouse, and receiving as good attention there as was possible. But she needed surgical treatment. She was sent to Lexington, and I met her at the train. She was a very sad and solemn looking little girl when I met her—did not smile, until I told her I was going to bring her to my own home. She had been worried by the questions of the passengers as to where she was going. She didn't know, but thought she was going to some orphans' home.

To help patients who can pay little or none of the expense, Miss Neville founded a fund. Early in her work she was given $25 for her patients. She placed the money in the bank, and named it "The Mountain Fund." It is now contributed to by a great number of persons.

She also leads doctors and nurses, with supplies, to hold eye clinics in remote places. The caravan is reminiscent of pioneer days—usually it is a wagon, pulled by four mules. Where use of the wagon is impossible, doctors, nurses, and Miss Neville stow the furnishings for the temporary hospital they set up wherever they go in "pokes." These are bags, tied at the open end, and the contents divided into the two ends of the bags, which are thrown across the backs of the mules.

"We made all of the arrangements for one clinic," Miss Neville said, "and while I was on my way there I noticed a blind man standing on a street corner. Of course, I stopped and talked with him. He had had cataracts for 12 years, and all of that time had been going about this small city, yet no one had ever stopped to find out whether he could be cured. I told him I would send him to a hospital, if he would go.

"Now, I always make it a point to talk to any sort of a gathering I can about prevention of blindness. Sometimes I get started, and find I have no right to talk. Once I found out that a woman's club was meeting, and after the clinic I went there. One of the leaders of the town was discussing a literary matter that wasn't of much importance, one way or another. But the room was crowded with women—and this clinic had been going on, caring for people who had been under the noses of these women for years. When I talked, I told the club about a blind man I met on a street corner, and about prevention of blindness. While the club members admitted they passed the blind man every day for 12 years and that at times they were hard up for something to do to uplift the town, but hadn't seen that any thing was amiss. The blind man was sent to the hospital and cured. His daughter, 18 years old, he had not seen since she was six."

This is a sketchy glimpse of what has been done toward the prevention of blindness in Kentucky, particularly in the mountain section. It has been done voluntarily, without pay, and, until lately, unofficially. Recently, the Public Health Service and the Red Cross have stepped in, and lightened the work considerably.

Miss Neville smiled when asked her reason for interesting herself so deeply in people who are about to be blind.

"Because I did a mean thing," she said. "I used to do a great deal of social entertaining. I invited a group of ladies up for tea one Monday. Sunday I was invited for dinner with some friends in the country, and was told that I could get home in time for the tea. When I left, preparations for the tea were not made. The cups were to be washed.

"Selfishly, I stayed in the country until it was possible for me to get home only five minutes before the tea. My sister had had to wash the teacups. But during the time I was in the country I heard the story of a blind girl, who had been brought from the mountains to Lexington for treatment, but brought too late. We were sitting out on the lawn, and the thought that any one should be blind, and unable to see the beautiful Blue Grass country stirred me. It didn't seem fair. Within a year, I gave up my teaching, and devoted myself to the blind."

Community Players Are Americanizing the Drama

Believed the Little Theater May Yet Supplant the Commercial House

By J. OLIN HOWE

WHAT with one thing and another, the most significant development in American dramatics is the community theater. Not "amachure" theatricals. Those are quite out of vogue in the nineteen-twenties. In their stead we have little theaters, neighborhood playhouses and groups of community players all about this broad land.

Sometimes these have their own buildings. More often they do not. Not infrequently their performances are given in the town hall or even in the basement of a country church. Their habitat ranges from our largest cities to towns so small one not familiar with the movement would be amazed to meet it there. They are one with the summer theater in the vacation country and a multitude of pageants.

Always the community theater is of vital consequence in its own locality, socially and sociologically. Its players act for the love of it. Its audiences know themselves leading factors in the ensemble. Its effects are gained simply and at no great expense. It is neither commercial nor professional. It gives expression to that high instinct for the dramatic so definite in the American temperament and so near the American heart.

With the decadence of the commercial theater in this country there must come some substitute with a wide appeal. The local stock company affords dubious relief, is scarcely in keeping with the times. The movies can never be more than a complement of the speaking stage. It is unthinkable that they should take its place. It may be the community theater is the answer.

Already there has been no slight infiltration from it to the professional stage of stage directors, costume designers, scenic artists and experts in lighting, as well as actors and actresses.

To say naught of playwrights. The Great American Drama may yet make its way to fame from the community theater. Indeed, perhaps the community theater is itself the great American drama.

Having so said, we hasten across the continent to the beautiful Hollywood Theater in California, where Mary Austin, novelist, playwright, publicist, is sitting with Professor Alfred G. Arvold, whose Little Country Theater is the sociological experiment station of the North Dakota Agricultural College, absorbed in a characteristically delightful performance by the community players. Mrs. Austin is a pioneer of the community playhouse and what Professor Arvold is we shall see.

In the course of the Hollywood play a great water lily arose out of the depths and slowly its dazzling petals began to unfold. Lower and lower they drooped until there was disclosed within a lovely fairy group which made its entrance in this unusual way.

"Fine!" whispered Arvold. "That's a splendid thing, and I can use the idea in North Dakota. Only there the water lily will have to be a cabbage."

It is a strong point with community theatricals to be locally convincing. To be a success, they must be. There is much in the commercial drama as it comes from New York that is outside the experience of people elsewhere. A Portia in bib overalls and with her hair tucked up would look outlandish on Broadway, but in the mining town where she actually wore this costume a gown would have seemed as strange. The local justice of the peace who played the judge was similarly garbed, as it was his custom to be every morning in his own court, and she who pleaded before him must dress in keeping if the effect was to get across the footlights.

So Professor Arvold went back to North Dakota and staged a scene in which the Hollywood water lily became a cabbage instead, to the delight of northland audiences.

"Instead of making the drama a luxury for the classes," he says, "make it an instrument for the enlightenment and enjoyment of the masses. Just imagine what a tremendous force the drama would be in North Dakota in getting its 700,000 people to express their higher and finer instincts. As an art, a literature and a social force it would then be an aid in making life what it is supposed to be, a precious existence between birth and death. A home talent play not only affords people one way of finding themselves, but it also unconsciously introduces a friendly feeling in a neighborhood. It develops community spirit because it is something everybody wants to make a success regardless of local jealousies or differences of opinion."

So has this college professor become an instigator of social betterment on many a Main Street in his state in carrying out his purpose "to use the drama and all that goes with it as a sociological force in getting people together and acquainted with each other so they may find out the hidden forces of life itself." He teaches those students in his English classes who go in for this phase of the work everything which goes into the presentation of a play—making scenery and costumes as well as how to act—and even to write their own.

He persuaded university officials to give him the use of a discarded chapel at Fargo and there the students first produce the plays in which they later appear in various parts of the state and whose presentation by local players they aid and abet as they may. Ever they strive to develop means and methods applicable to local conditions.

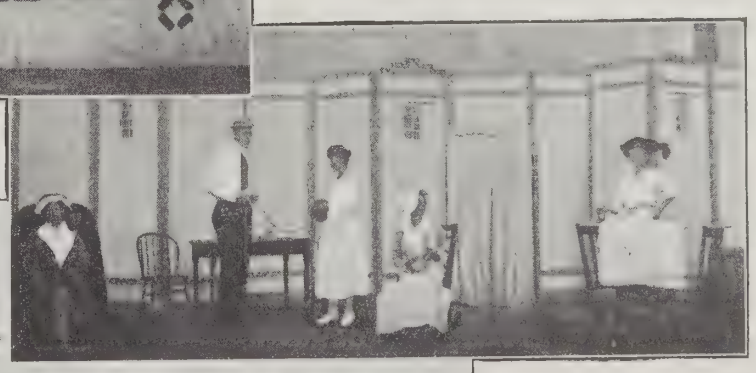
Arvold has even used harvester trucks placed end to end for a stage, and at a railroad junction flat cars have been made to serve the same purpose. He used to utilize farm lanterns for lighting, which gave many in the audience a personal interest in the show; now the world has moved and automobile lamps take the place of oil lanterns, but the personal interest remains. He also has been known to pour kerosene on ashes to make flares, possibly not unlike those in use in Shakespeare's day.

Down in North Carolina there is another man who is doing valuable work along similar lines, Frederick H. Koch, professor of dramatic literature at the University of North Carolina, who got his earlier training with Arvold. He and his students in English have gone far in the development of folk plays, North Carolina being especially rich in material for that sort of thing.

Arvold's Little Country Theater has a repertory of wide range among the works of professional dramatists; it is in no sense limited to those who have written for the community theater, and it includes as well fine examples from the pens of his own students; but Koch's Carolina Playmakers are devoting themselves to building up a native literature in their own state. In three seasons they have gained no little fame for their original folk plays.

Characters are drawn from the young playwright's observation or experiences or from that wealth of folklore which pervades the very atmosphere of the Tar Heel State. The results are most interesting; and, more than that, they point the way. Koch is blazing a path which may mean much to the American drama.

The profits of the Carolina Playmakers' tours thus far have been applied to the remodeling of the old law building at the university for a playhouse and laboratory.



Nor does this mean that community plays and pageants have been thrust into the background in North Carolina. Far from it. Local players have always at their command all the resources on Chapel Hill and whatever aid Professor Koch and his student players can give. Besides, he and they have given special attention to pageants, many of which, of most ambitious

New York's "Curb" Limbo of Lost Investments

Medium Through Which All Types of Crooks Loot the Speculating Public

By CHARLES ALBERT COLLMAN

FOR close upon half a century, the New York "Curb," the so-called outside market in securities, has been the *enfant terrible* of Wall Street, and its least commendable institution. Yet it is the second largest stock and bond market of the country, subject only to the New York Stock Exchange, its transactions being about 15 times larger than the combined totals of Chicago, Philadelphia and Pittsburgh, including Boston, the primary mining market of the United States.

The Curb has never been an inspiring spectacle. A mere mob of shrieking, howling men, it occupied the center of Broad street, where its status was ever in doubt. Cheap buildings on either side housed brokerage firms, which looked more like dens than reputable business offices. In the open windows, pallid youths called or signaled orders for stock purchasers to the members down in the mob.

Representatives of the Department of Justice in Washington, and of the offices of many conscientious criminal prosecutors have been warning the public that unconscionable brokers have been defrauding the country of hundreds of millions annually. Yet the amount of money that the master minds of the Curb have devoured out of public savings during that unscrupulous half century, makes those warning figures shrink into insignificance. It may be said truthfully that the New York Curb represents a cloaca, into which billions of the people's savings have been poured, and only an infinitesimal amount has ever been returned to the original owners. Figuratively speaking, the residue has always been devoured by that species of immense rat that infests the lower part of Manhattan Island.

Members Largely of Alien Race

A CASUAL glance at these rodents will show the observer that they are not indigenous to American soil. Their characteristics prove them to be of an alien race, and this in overwhelming proportion. Until a few years ago, the so-called "Father of the Curb" was E. S. Mendels, a Jewish broker. Old man Mendels was square and honest. In the years gone past he often bewailed to me the fact that the acts of members of his own race had made the Curb a byword throughout the country.

If a list were drawn of all the crooks, scalawags, confidence men, potential jailbirds, ex-convicts, plunderers, imposters, falsifiers, robbers, schemers and fugitives from justice who preyed upon human credulity through the medium of the Curb, and if it were printed in diamond type, this page would not begin to hold a small proportion of their number.

Most of the old gold and silver mining swindles of the past generation, the copper, zinc, wireless, motor and oil impostures of a later period, have found their beginning on the New York Curb. One successful mine, such as the Nipissing, gives rise to a score of spurious mining companies; one industrial success, such as the telephone or the cash register, induces hundreds of schemers to inflame the imagination and gambling spirit of the inexperienced to place their money into worthless stocks which have no reason for existence.

The campaigns of these tricksters are conducted throughout the length and breadth of the United States and Canada. There is scarcely a city, town or hamlet that escapes their circulars, local representatives or traveling salesmen.

The young man who has saved his first thousand dollars, won through individual effort, holds the future in his hands. Yet there are persons mean enough to make it their life's business to prey upon Young America and demoralize his ideas of thrift. For years I have received communications and queries from young men regarding the status of "investments" they had been induced to make with their first $700 or $800. It is a fact not alone distressing but alarming that 99 7/8 per cent of such investments are made in valueless securities of the New York Curb. In the long history of Wall Street, I have failed to learn of a single protest raised against this practice. One looks in vain to efforts on the part of eminent Wall Street bankers, their high-priced publicity agents, and their trained economists, the graduates of leading colleges and universities, to correct this wrong.

The One Time the Oil Came

IT IS doubtful whether these young men could be induced to part with their money so readily, if they knew into whose greasy hands it would lodge, and if they would learn the lesson that even though some mining property may have intrinsic value, its stock is probably worth less than blotting paper.

Some years ago there occurred an incident, with a curious moral, that caused a laugh on the Curb, although at its own expense. Five so-called brokers opened offices in New street and began selling a Curb stock in an alleged oil property. To guard against future trouble, they had first sent one of their number down to Oklahoma. He bought up at random some cheap acreage, far from oil-producing territory. Then he engaged some Swedish workmen to start a pretense of drilling operations. He returned to New York, confident that he and his pals could assert a claim to possessing some real property in case any of their victims should squeal.

But the methods of the schemers were so crude, and their claims so extravagant, that the Federal authorities began an investigation into the affair. The books were seized, the brokers were placed for trial, convicted, and finally landed in a Federal prison.

Far off in Oklahoma, the honest Swedes knew nothing of the closed New York offices or of the fate of their employers. They industriously kept on drilling for oil, and unexpectedly they struck it—a couple of rich gushers. It was long, long afterward that this news trickled into the cell house of the prison in which the brokers were lodged. Their useless rage may be contrasted with the previous anger of their customers whom they had victimized with worthless shares.

The history of the outside market is supposed to date back to 1792, when two score men were accustomed to meet under a buttonwood tree in Wall Street to trade in securities. They got under cover in 1820, and gathered in the Merchants' Exchange. But some of their number objected to meeting under a roof, and from this group of dissenters, the Curb was gradually evolved.

The outside market could not have maintained its long existence unless it really fulfilled in part some useful purpose. It has a legitimate use as a market for stocks and bonds of corporations that decline to comply with certain regulations of the Stock Exchange, and, consequently, are not listed on the big board. For years the only place where Standard Oil shares were traded in was the Curb, and many smaller companies have financed their requirements there.

When the World War began in 1914, and the Stock Exchange was closed, the Curb flourished as the only open market. Since the war it has become the trading place in vast issues of foreign bonds.

The Curb has been the birthplace of millionaires and rogues. It has been the fruitful field of more swindles and scandals than any other association of men in the country. It was not organized. Anybody had the privilege of stepping from the sidewalk to gamble with the mob if he could induce others to trade with him. It was the scene of "wash sales," false quotations and every conceivable form of financial crookedness.

Until quite recently, Wall Street's foremost statistical organ, the *Financial Chronicle,* headed its list of Curb quotations with the following stereotyped paragraph:

> Below we give a record of the transactions in the outside security market. On the "Curb" any security may be dealt in and anyone can meet there and make prices and have them included in the list of those who make it a business to furnish daily records of the transactions. The possibility that fictitious transactions may creep in; or even that dealings in spurious securities may be included, should, hence, always be kept in mind, particularly as regards mining shares. In the circumstances it is out of the question for anyone to vouch for the absolute trustworthiness of this record of Curb transactions, and we give it for what it may be worth.

To anybody familiar with Old Polonius, as the conservative *Chronicle* is known in the street, these words were scathing in their condemnation.

Investigated in 1919

THE scandals of the outside market became so notorious that, in 1919, Governor Hughes, of New York, appointed a special commission to investigate it. The commission recommended an amendment to the Penal Code for the punishment of fraudulent tipsters and crooked financial advertisers. Then a movement was begun to clean up, under the leadership of Mendels, the "Father of the Curb," which resulted in the organization of the Curb Market Association. Some form of regulation was enforced, but it availed little.

From the year 1880 until the middle of last summer, the Curb market was conducted in the middle of Broad street. Then the Curb finally decided to assemble under a roof, and since last July it has occupied its own building between Rector and Broad streets, west of Trinity churchyard. It charges a high membership fee, and asserts that it is on the path of reform. Undoubtedly, Mr. E. R. McCormick, its president, and his immediate associates are sincere in their intentions. The result of their efforts has been disappointing. During the last four or five months, 60 brokerage firms have failed in Wall Street. Many have been charged with "bucketing" and other wrongful acts. A large proportion of these firms were members of the Curb.

One is compelled to reach the conclusion that Wall Street never changes; it merely develops.

There has been no let-up to the vicious practices pursued by Wall Street brokers in trying to market valueless shares which are listed on the Curb. Their touts and tipsters swarm everywhere. Last autumn, one of these thick-lipped rogues, fashionably clad and sporting gold-rimmed glasses, earnestly besought me to join a pool in a certain oil stock. It was a small, exclusive operation. The stock was then quoted at 26 cents. A group of brokers, he said, were putting up $30,000 to "hoist" it to five dollars. But the oil stock never went to five dollars. It steadily declined, and today it is selling for 12 cents.

Later this tout confided to me the plans of his campaign to sell shares in a new oil proposition put out by the same group. He was going to Pennsylvania provided with a list of well-to-do men in the smaller towns, who were supposed to have gambling proclivities. His mission was to represent himself as a wealthy oil man, strike up acquaintanceships in hotels and banks, and persuade his "prospects" to join a pool similar to the one in which he had tried to inveigle me. I was pleased to learn upon his return to New York that his design had been unsuccessful. Oil stocks were temporarily out of favor owing to stories of salt water invading the Mexican oil fields.

Curb brokers, convicted and sent to prison, generally reappear upon the scene of their former operations. It is a strange fact, but true, that they are welcomed without question by most of their fellow brokers. One of the most notorious of this type, who, by his own confession, has a shady past, is Simon Jacob Herzig, better known by the Christian alias that he uses, of George Graham Rice. This man has the reputation among his craft of possessing extraordinary talent in writing the sort of prospectus that will lure the inexperienced to hand over their money.

It is probably due to this trait that Herzig, alias Rice, has won the distinction of having foisted upon the foolish and unsuspecting as many Curb stocks as any of the master minds of his own type. A once prominent American magazine exploited this person with the publication of a serial story entitled "What I Did With Your Money." This lack of journalistic intelligence cost the publication dear. Herzig later gave a job to the editor of the magazine.

Emma Silver – Cent a Share

IN 1916, Herzig was the principal figure on the Curb in a spectacular gamble which revolved about some of his mining properties and brought loss to thousands. These were Emma Consolidated and the Old Emma Leasing. Emma Consolidated was sold at $3.75 a share. After shipping a few hundred tons of ore, it went into the hands of a receiver. Today both stocks are worthless.

I quote from the official mines handbook:

> Emma Consolidated Mining Company.....Dead
> Old Emma Leasing Company.....Dissolved

The residue of these miserable properties was turned into the Emma Silver Mines Company. The other day Emma Silver was quoted at one cent a share.

The impudence and arrogance of Herzig, alias Rice, are beyond belief. He was arrested in 1920, and tried in the Court of General Sessions, charged with the theft of $721 from a farmer in Ohio. During the progress of his trial he assailed the prosecuting attorney. But perhaps it may be best to give the record of this man in his own words, as published in the New York *Herald,* January 16, 1920:

> "Rice took the witness stand, and after admitting that his real name is Simon Jacob Herzig, he told of having served terms in Elmira Reformatory and Sing Sing Prison. He also admitted that he was arrested on several occasions for accepting wagers on horse races.
>
> "He declared that in 1917 and 1918, his office, which was at No. 27 William street, did a business of $35,000,000 in stock transactions, few of which concerned stocks dealt in on the Stock Exchange, and that the yearly expense of his office was $1,000,000. Orders for less than $40,000, he said, did not receive his personal attention.
>
> "He declared that the head of the correspondence bureau of his office was Trumbull White, a one-time editor of a magazine, at a salary of $26,000, and that Frank Stockbridge, writer, was his assistant. He also said that William Barrett Ridgely, Controller of the Currency under President Theodore Roosevelt, was another of his employes."

This statement, with the names mentioned, illustrated the demoralizing influence that the financial success of persons of this type exerts upon American life. Herzig was sentenced to three years in Sing Sing Prison. That was in January, 1920. Today he is still free. He is appealing his case, living meanwhile in an expensive New York hotel.

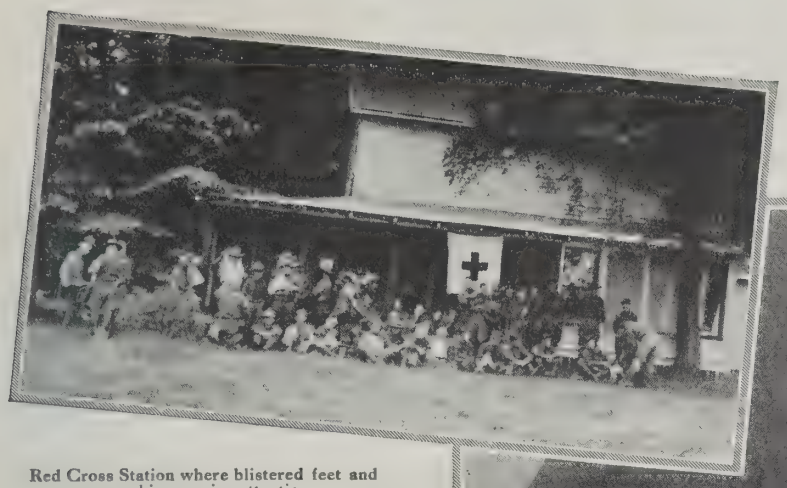
The "Wolves of Wall Street"

IT IS a difficult task for public prosecutors to imprison men of the ilk of Herzig, David Lamar and "Nicky" Arnstein. These Wolves of Wall Street, amply fortified with the "fat money" they have made in their peculiar ways, are able to engage ingenious counsel.

Year after year new mining stocks are listed upon the Curb. In a short time they vanish, to be replaced by others. A glimpse at a few of those in which country-wide investors have dropped their money may be enlightening.

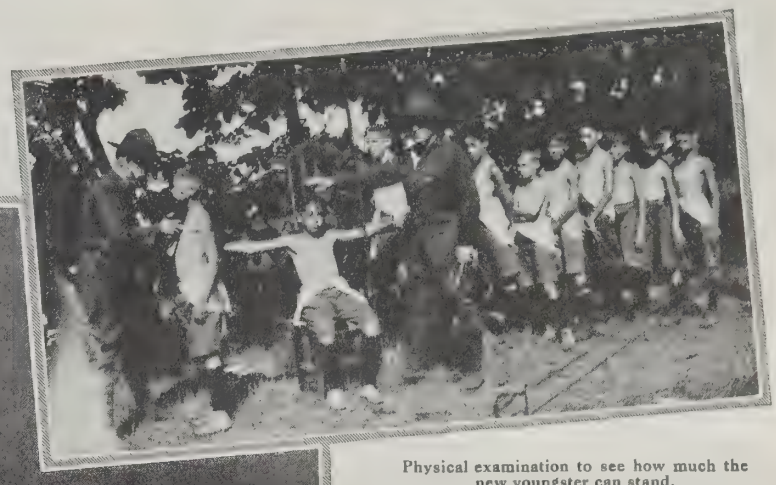
Ely Copper Company. Idle since 1907. Unfavorably regarded.

Ely Consolidated Copper Company. S. M. Levy, president, at last accounts. Stricken from the New York Curb in 1918, but still quoted there at three cents a share. No work done in recent years. Some of its copper below commercial grade.



Butte-Balaklava Copper Company. I. Freimuth, president. Stock sold in 1910 at $14.50 a share. Interest on bonds unpaid since 1917. Property idle. Foreclosure proceedings by bondholders expected. Company has had a checkered career.

First National Copper Company. Thomas W. Lawson, president. The stock was manipulated to $10 a



(Concluded on page 14)

In Camp Roosevelt Even School Is Pleasing

Chicago Boys Learning That Play and Study Go Hand in Hand

Red Cross Station where blistered feet and sore shins receive attention.

Physical examination to see how much the new youngster can stand.

Really studying in the Camp Roosevelt school under canvas.

NOW we know that the world is rapidly changing, for the meaning of common words that have been landmarks have altered their meanings. Your dictionary says that work and play are opposite in meaning. But in a certain large camp in Indiana they are synonyms.

It sounds paradoxical to say that boys study better and harder during vacation than at any other time, but the statement is justified. It is proved by the progress made by the boys who go to the Camp Roosevelt summer high school.

The outdoor school which is but a part of this great camp for boys was launched with considerable misgivings even by the public-spirited men and women who were back of the Camp Roosevelt idea. Experienced educators were skeptical of the chances of getting boys to study when there were many opportunities for diversion. When Camp Roosevelt began the constructive summer plan of boy-building in 1918, the outdoor high school was also started. From the very beginning it has been successful. This much is certain, boy-building has a habit of upsetting many preconceived notions. The young fellows who have been students of the school in camp have shown themselves able to proceed with thoroughness and greater rapidity than students in the regular high schools in Chicago. Standards of scholarship for the camp school have been high and the venture has shown it possible for backward boys to straighten out many kinks in education.

The boy wants to get next to the fundamentals. He likes his dry bits of theory sugar-coated with the liquid of outdoor life and physical exercises, games and stunts. But putting sport into study is not the only achievement of this camp. Conducted by men who have not forgotten some of the lessons of war, they have a fourfold motive in physical training, recreation, patriotism, and educational advancement.

Camp Roosevelt had its inception in the mind of Major F. L. Beals, supervisor of Physical Education in the Chicago high schools. Major Beals enlisted the aid of the War Department to equip the camp with cots, tents, mess kits and things of that nature. In turn he interested Chicago business men in contributing funds to carry on the work. The camp is wholly philanthropic but is controlled through the Chicago Board of Education.

Major Beals outlined his plan to Superintendent Mortenson of the Chicago public school who made the camp an auxiliary of the Chicago summer school system. Credits received in the camp are honored on the same basis as the other summer schools within the city. The athletic directors and physical instructors, as well as the entire staff of the summer school, are selected from the public schools of Chicago.

The city-bred boy, behind in his studies at the close of the school year, may wish to advance more rapidly so he enters the summer school division, knowing that he is going to have recreation in the form of swimming, shooting, baseball, football, basket ball and a score of other sports. The boy who wishes to learn printing or woodworking or automobile construction finds at the camp a completely equipped workshop built of logs with competent instructors. Zoology, botany and other sciences are taught and natural resources for laboratory analysis are found within the camp. Stand-bys like English and algebra are taught in a wholesome, healthy environment where the mind is fresh and clear and quick to grasp the problems.

Charles H. Smith, assistant principal of the Hyde Park high school of the Chicago school system who is principal of the camp high school, says that pupils learn their high school subjects more readily in the informal environment of the camp school than in the more stilted surroundings of the city schools.

It isn't necessary for every boy to go to the camp school in order to enjoy Camp Roosevelt. He may have a genuine vacation and build up his physical body. The physical course is prescribed for every one in the camp, which is the big thing. Boys from 10 to 14 years may go and find suitable companionship in the Junior division where the mysteries of woodlore and camp fire are delved into. Any boy from any part of the United States is eligible.

Camp Roosevelt spent its experimental years on the shores of beautiful Lake Harbor. This location is a day's ride from Chicago, and five miles from Muskegon. This year the camp is on its permanent site near La Porte, Indiana. The Camp Roosevelt Association secured a tract of about 250 acres, near La Porte, upon which had been erected and used for several years the buildings and equipment of a boys' school including a gymnasium, mess hall seating 1,000, kitchens, electric power plant, deep well, modern sewerage system, large hospital, and classroom buildings, bungalows, dormitories, and recreation rooms. The tract includes and surrounds Silver Lake (about 80 acres in extent), with sandy beaches, diving platform, and so on. Large fields provide for tentage, sports of all kinds, and parade ground. The ground is rolling, well wooded and drained, and the surrounding country affords opportunity for hikes in every direction.

Although Major Beals is an army officer he does not conduct the camp on strictly military lines. The terms are military as are the terms of the Boy Scouts. There is a regular program that calls for obedience and guidance and attention to detail.

The first introduction is interesting. There is a stiff physical examination. A large cottage shaded by oak trees has been converted into a hospital and is kept in readiness for the first-aid cases. Sick-call is part of the officer's routine for every day, but the records show that nothing more serious in 99 per cent of the cases than blistered feet, sunburn, and minor afflictions ever puts in an appearance. However, first aid is a part of the training of every boy.

Health has proved contagious to many of the boys at the camp. They have found themselves infected with it and have carried it home with them. Toothbrush drills, daily bathing, moderation in eating, are a few of the things that make an impression upon the none-too-careful lad coming from the canyons of Chicago.

Under Major Beals are the commissioned and non-commissioned officers of the Army. These are detailed by the War Department. The leaders among the boys themselves are those who have won promotion through merit. Each boy is under constant supervision. The boys rise at reveille and go to bed at regular time. Democracy and a sense of responsibility are the first lessons taught. Cleanliness is a camp virtue that is soon learned. Obedience comes to be a natural qualification and alertness goes along with the training because the dullard has to overcome his dullness to keep step with his fellows, and intolerance for authority is soon displaced by admiration for good leadership.

Freedom from nagging is another step in the boy-building plans. The under-managed and over-managed boys leave camp with a new conception of their fellows.

Two of the most important secrets of Camp Roosevelt and its success since 1918 have been "keep busy" and "responsibility." These are old formulas equally potent at home as in the camp but in the latter they are administered by practiced hands which is not always the case in many homes.

The boys are kept pleasantly busy, but there is the full quota of pleasure and diversion. The energetic youth does not find time hanging heavy on his hands. There is always something going on. There are studies, or drills, or hikes. There are swimming classes, band concerts, motion picture shows and programs at the Y. M. C. A.

Good food plays its share in efficient development. The buglers waste a great deal of breath in running out the mess-call to its last ultimate note. And watch them eat! What a panacea for dyspepsia. If all the dyspeptics in the world could get a glimpse of what an appetite can really amount to they would be so shamed by their own digestive shortcomings that they would find some way to overcome their handicap.

A part of the routine of camp work is guard duty (neither dangerous nor onerous) but the responsibility is exceedingly helpful. Standing guard means watchful service and attention to details. Woe to the young fellow who attempts to skip camp for an unauthorized stroll or an outsider who would enter without proper authorization.

It so happened that one time a prominent banker-publisher sought to take a carton of ice cream to his son. He was promptly halted by a 12-year-old sentry. The publisher was forced to admit his attempt to smuggle the ice cream into camp without special authority. The young sentinel hated to see anybody deprived of ice cream but he was determined to do his duty as he saw it, so he turned in a call for the officer. That young gentleman, likewise zealous, supplied the banker-publisher with a special guard and escorted him to headquarters where the eminent visitor was able to explain things. By the time the affair was settled the July sun had played havoc with the ice cream.

Athletic instruction is regularly given. The plan of instruction includes active participation in swimming, baseball, rowing, and so forth. Swimming is given particular emphasis on a most inviting beach. All are taught to swim.

Major General Leonard Wood, in looking over the camp previous to his sailing to the Philippines, said:

"The work being done here has proved a surprise to me. The military and civil work are so well combined that the boys get enough of both, without too much of either. The camp site is especially good. The water is good and the setting is beautiful. Captain Beals (now Major Beals) and the officers under him are doing a wonderful work and the way in which they do it is proof that they understand boys."

As school must be in heaven.

JUST BEFORE THE START OF 500-MILE SWEEPSTAKE IN 1921.

Indianapolis 500-Mile Race Proving Ground for Automobile Engineering

By W. D. EDENBURN

MORE than 135,000 persons paid to see Jimmy Murphy, a Los Angeles lad, flash across the wire in the record time of 94.48 miles an hour and win the Indianapolis 500-mile sweepstakes on Memorial Day. The crowd was gay and happy. Although no accidents had furnished excitement the battle between the drivers had been keen, with Murphy out in front for more than half the race.

The average American attended the race to see the monster spectacle, the "world's greatest" in the speed sport. They came because it was a national event. Little did the average speed fan know that the race was a proving ground for automobile engineering and that the men who design and improve the cars that the owners drive were studying the results of the speed test.

Murphy's drive was unique in that he was able to jump the average almost five miles an hour on a brick course, comparatively flat, which was designed for a maximum of 85 miles an hour, a matter of 12 years ago. The Los Angeles lad was out to beat Ralph de Palma's record average of 89.84 made in 1915 and he topped it by exactly 4.64 miles an hour.

Harry Hartz, another Los Angeles youth, crowded Murphy all the way, finishing second at an average of 93.53 miles an hour. It was the first time in the history of the annual classics that the cars showing the fastest speeds in the eliminations were able to withstand a gruelling pace and finish in the order they qualified. Murphy averaged 100.50 in the trials and Hartz 99.99 in his trial.

The only foreign car to figure in the money was the French Ballot, driven by Eddie Hearne. In the last four races Ernest Ballot has made every effort to win. This year his cars were not so fast as the American productions, but if Jules Goux had not met with misfortune early in the race without a doubt he would have had third or fourth positions, if not second place won for Ernest Ballot.

Ralph de Palma, for the first time in three years, did not have the fastest car in the race. He held on to front row position at the start but was not among the first 10 at the halfway mark. It was unusual for De Palma to be so far behind as twelfth at 250 miles. For three years he has lead at this point. De Palma, like many others, did not believe that the leaders could keep their cars running at a pace better than 95 miles an hour and planned to save his Duesenberg in the first half, driving very conservatively. In the last half he pushed his car and climbed from twelfth to fourth, but was not equal to catching the flying Murphy, Hartz and Hearne. The first four drivers drove the entire 500 miles.

This race taught the engineering fraternity one thing, if nothing more. That was that they had concentrated on engine faults and neglected the chasses. Of the 12 cars to go out of the race eight were eliminated through chassis defects. Six were rear axle defects, the "freezing" of differentials and the breaking of axle shafts. One was a broken frame, while another threw a front wheel, breaking the front axle spindle. The other four were minor engine defects, two being valves, another of broken gas line, and one, general engine trouble.

Three cars finishing the race had steering arms break, luckily all on the right of left-drive cars, so that the right wheel would caster and the driver could manage the car with the left wheel still connected to the steering. Joe Thomas' car, which finished tenth, had this misfortune early in the race. Ralph De Palma had a double arm and only one broke, so he was not forced to stop. I. P. Fetterman, driving his car into seventh place, tooled it around the last 10 laps with the tie rod and the steering dragging. He had good control on the stretches and eased up on the turns. This again proves that the metallurgists must give more attention to the chassis metals, especially those that get the full force of vibrations.

JIMMY MURPHY, winner of 1922 race.

In the last few years the main trouble has been the engines, principally lubrication, which results in almost every instance in the melting of connecting rod bearings and the breaking of connecting rods. In not a single instance of elimination was a connecting rod or lubrication at fault.

The chasses are not standing up for the reason that the engine speeds are much greater and the amount of power applied greater in proportion, due to the lightening up of the chasses for the smaller engines.

The Indianapolis race has done much to refine the mechanism of the motor car. This two and one-half mile brick track has always been the world's most difficult course to drive. It is rectangular, with four turns and four stretches. The turns are only slightly banked, making it almost impossible to drive a car wide open. The 12 years' "weathering" has made the track rough. To the eye it is smooth but at 100 miles an hour it is far from smooth. This results in heavy strains on metal parts, as the constant vibration results in crystallization.

Indirectly, the automobile engineer has been able to use the track to test the metals of his individual car, by observing results of the races. Speed and its attendant crystallization try the metals and prove the durability of steels and alloys.

In wire wheels the weight of a car is carried in suspension, while in the wood wheels the weight of the car is carried on a column under compression. After two 500-mile races the wire wheel began to appear in these events. It proved its worth in the reduction of tire wear and for several years no driver has attempted to use the wood wheels. The wire and other metal wheels also aid in radiating the heat of the tire, generated by friction, and contributing to longer life in competition, through this radiation. Wood is a non-conductor and the heat, generated with the wood wheel and demountable rim, can only be radiated by the steel rim, while with wire or metal wheel the radiating surface is multiplied many times.

The first American cars used light wire wheels for stock production, but soon the manufacturers turned to the artillery type of wood wheel, because it was much more substantial. When wire wheels gained popularity in races, they became popular for stock cars also. The same holds good for the steel wheel.

When racing was young the majority of the cars had chain drive and in the early events on the Indianapolis course they still predominated. Soon after the brick track became the crucible of the industry the

MORE THAN 135,000 PERSONS WENT TO INDIANAPOLIS FOR THIS YEAR'S RACE.

makers learned that the shaft drive was the most efficient and today chain drive is limited to heavy-duty trucks.

The steels and alloys used in the race cars had much to do with developing the alloy steels, such as vanadium and molybdenum used in stock production today, which makes it possible to increase the economy of car operation and tire consumption by lighter construction without sacrificing the strength of the car. This is particularly true of the steering knuckles and other steering mechanisms. A decade ago they were massive drop forgings, while today they are finger size and possess more strength than the massive units of yesteryear.

The race car has had its effect on body design. The drivers learned that by smoothing out the angles and giving the car a continuous smooth surface from radiator to tail, that it increased their speeds. In racing body design a pointed tail is used at the rear to conceal the oil and gasoline tanks but in stock cars this is not necessary, although the angles and sharp corners have almost universally been done away with.

Racing at Indianapolis has had a lasting influence on engine design. It has probably had more to do with the improvement of engine design and with increasing its efficiency than with any other unit.

Beginning with the first two 500-mile races the engine was limited to the 600-cubic inches-or-under class. This means that the cubic content of the cylinders totaled not more than 600 inches. In those days (1911 and 1912) the engines were almost square, which is to say that the bore equaled the stroke and the average engine never "turned over" more than 2,000 revolutions a minute. The 75-mile-an-hour car was the speediest of this era and its gasoline consumption was many times that of the car that the owner handles in this day and age.

The owners of the speedway, at the suggestion of its president, Carl G. Fisher, announced, after the 1912 race, that the next year the maximum engine size would be 450 cubic inches. This was the beginning of the reduction of the bore of the engine and the longer stroke, that the power might not be sacrificed. After two years of 450-cubic-inch engines the 1915 race saw the size reduced to 300 cubic inches. When the announcement was made in late 1914 the calamity howlers maintained that the race was ruined, from a speed standpoint, and that there would be a dearth of cars, due to the lack of 300-inch engines.

The Daimler factory in Germany built 300-inch engines for the 1914 French Grand Prix and made a sweep in winning this famous road race. It sent one of its cars to America and Ralph de Palma triumphed over the French Peugeot, of Dario Resta, winning the 1915 event with the record average of 89.84 miles an hour. This performance had a lasting influence on American design, particularly when this country later faced a fuel shortage, due to the war.

Beginning with 1920 the race was cut to 183 cubic inches and the tenth race was the last for this class, as next year cars of not more than 122 cubic inches will be eligible. In 10 races the engine size has been reduced to one-fifth of the power plant limitation in the initial event.

In the 1919 event Ernest Ballot, a French engine builder, constructed his first cars and sent them to America for the race. They were eight-cylinder engines with the cylinders in line, instead of the V-type then popular in this country. It meant that the crankshaft must be very long and still light enough not to reduce the engine power. This construction permitted turning the engines to 3,800 and 4,000 revolutions a minute, also an increase in power.

The next year Ballot duplicated the type for the Indianapolis race in the 183 class and Fred Duesenberg adopted the same design for his fleet of racing cars. This means that the bore of the cylinder must be approximately two and one-half inches and the stroke four and five-eighths inches. The stroke in the running of 10 races has been increased to almost twice the size of the bore, the engine is more economical in fuel consumption, while the horse power has been increased, with the engines weighing one-third of what they did in 1911.

The Official Times and Prizes

The official times, averages and division of the race purse for the Indianapolis sweepstakes were:

Driver	Car	Time	Average	Prize
Murphy	Murphy Special	5:17:30.79	94.48	$20,000
Hartz	Duesenberg	5:20:44.39	93.53	10,000
Hearne	Ballot	5:22:26.06	93.04	5,000
De Palma	Duesenberg	5:31:04.65	90.61	3,500
Haibe	Duesenberg	5:31:13.45	90.58	3,000
Wonderlich	Duesenberg	5:37:52.84	88.79	2,200
Fetterman	Duesenberg	5:40:55.54	87.99	1,800
Vail	Duesenberg	5:48:19.16	86.15	1,600
Alley	Monroe	5:55:53.46	84.20	1,500
Thomas	Duesenberg	6:03:24.23	82.50	1,400

HARRY HARTZ,
Who finished second.

EDDIE HEARNE,
Who finished third.

The engine materials have also been refined in this racing crucible, along with the knowledge of metals gained during the war in the construction of airplane engines. The Germans showed the Americans the worth of cast steel cylinders or cylinders drawn from steel tubing. This was the type of cylinder used on their engine in the winning of the Grand Prix and the 1915 Indianapolis race. The knowledge of the steel cylinder was utilized by the designers of the Liberty engine for our airplanes. They found for production purposes that the water jacket could better be welded on the cylinder drawn from steel tubing, instead of casting the jacket with the cylinder. The efficiency of the steel cylinder was demonstrated in De Palma's 1915 Indianapolis victory. Back in 1912, driving another Mercedes with cast-iron cylinders, he burned out a connecting-rod bearing with five miles to go and wrecked his engine. In 1915, with a lap to go, one of the connecting rods broke off at the wrist pin, where the rod connects with the piston, and in a twinkling had smashed the piston. The tough steel cylinder prevented the wrecking of the engine and De Palma won the race.

In the cooling of the engine the racing events have taught the engineers many things, which are reflected in ordinary stock cars the owner can purchase. In lubrication it has been learned that pressure feeding is the most effective and the majority of the engines in the race had pressure feed to all bearings with oil forced through leads drilled into the crankshaft. Almost every engine had what is known as a "dry crankcase." In other words, the oil from the bearings was not pumped back from the case direct to the bearings, but was pumped through a filtering device to a reservoir tank and then to the bearings. This aided in cooling the oil and preserved its viscosity, also in taking out impurities which might injure the bearing surfaces. This is not necessary in the stock car today but may be looked for in the future, when the fuel question necessitates the further reduction of piston displacements and the increasing of the engine speeds, to obtain sufficient power.

The 122-cubic-inch class, or two liters as it is designated in Europe, is the requirement for the French Grand Prix in July and will be the order at Indianapolis next year. This will mean that a four-cylinder engine will have a theoretical bore of three inches and a stroke of four and one-quarter, a six-cylinder would be two and five-sixteenths by four and three-quarter inches while the eight would have such a small bore that it is not thought the engineers will attempt to continue the eight.

Jules Goux, who drove a Ballot in the race, in discussing the smaller engine, stated that the European manufacturers were planning to run the engine speeds up to 5,000 and 5,500 revolutions a minute. Thus the speed of the engine in a little more than a decade will have been increased two and a half times, while the engine size has been reduced to one-fifth, the same horse power having been maintained in the average engine.

Another improvement and one of the greatest services the racing event has rendered to the car owner is the improvement in tires. When racing started on the bricks at Indianapolis the cord tire was only constructed in England, where Palmer was perfecting his manufacturing processes.

The tires were made of fabric and the treads were heavy. Back in 1913 the cord tire, with its increased mileage, made its appearance at Indianapolis and while it was not perfect it so far surpassed the fabric types that the drivers swung over to the cords almost immediately. The tire makers by testing their products on the bricks at Indianapolis, and on the board speedways, were able to produce rubber which would stand the terrific strains of racing and give the car owner the benefit of these discoveries.

In the first 500-mile race, Ray Harroun imported inner tubes from Italy and used casings especially aged for his car. As a result he went through the race at less than 75 miles an hour and only changed four tires. Contrast this with the performance of the late Gaston Chevrolet in 1920 when he drove his Monroe the entire 500 miles on the same set of cord tires and tubes at an average of 88.50 miles an hour.

Withal the average car owner owes much to the men who take their lives in their hands to drive for fame and money in tests such as the 500-mile races, for they subject all the units of a car, from the lock nut to the complete engine, to strains that an owner would never give them in a car, and the brick course in the Hoosier metropolis has for the last decade truly deserved the appellation, "the crucible of the motor car."

John Skelton Williams vs. the Federal Reserve

Concluded from page 7

It was through the instrumentality of the controller that irregularities were found in certain institutions which the Federal Reserve Board failed to investigate and report to the Federal Reserve banks at interest. The most conspicuous example of this negligence was that at the end of December, 1919, the amount which the Federal Reserve Bank of New York was furnishing on loans and rediscounts and through the purchase of its acceptances to one banking institution in New York City, was about $130,000,000. This institution, by the way, had been conspicuous for its speculative operations, most of which have since come home to roost. Mr. Williams has said, and the official figures will prove, that "many millions of dollars of the funds of that particular debtor institution were being used and employed in loans to executive officials of the borrowing institution and to syndicate enterprises in which they were heavily interested. For this borrowed sum of $130,000,000 exceeded by $16,000,000 the total amount of loans and discounts plus "bills and acceptances purchased" in the open market by the Federal Reserve banks of Dallas and Minneapolis.

Representative Ogden L. Mills, of New York, seeking to learn whether the Federal Reserve bank, provided paper eligible for discount is presented, would have the right to deny credit to a particular bank, elicited this reply:

Determining Money Rate

"BANKS all over the country, whether they have the right or not, are denying credit to customers who present eligible paper. Whether they have the right or not, they are doing it. There is nothing in the law that requires a member bank to take every loan that is offered to it. It is supposed the bank will be run with some intelligence and discretion. The system would go to wreck and ruin on any other hypothesis." Elsewhere, Mr. Williams added: "It may not be practical to identify the purposes for which each particular loan is intended, but I regard it as the duty of a Reserve bank to inform itself in a general way in regard to the purposes for which the money which it hands out to member banks is used.

"If the Federal Reserve Board finds that the Federal Reserve bank is in the hands of inefficient or incompetent men it can remove its officers or refuse to approve their salaries. The board can exercise a moral suasion which would be very effective. If the Federal Reserve Board should have knowledge of any rotten condition in any particular bank, and should find that that particular bank was being heavily favored by a reserve bank anywhere, I think it would be the duty of the Reserve Board to take action.

"A loan may be legal and rotten. If it is not rotten it may be unfair."

Mr. Williams advised Governor Harding that the excessive loan already referred to "is a concentration of the funds of the reserve system with one debtor bank, conspicuous for its speculative operations and promotions which, in my judgment, is not only not justified but distinctly dangerous, and I feel it my duty to register my strong dissent from a continuance of such conditions as these by writing you, as I am doing, as an ex officio member of the board." As the bank in question was not a national bank and therefore not under the supervision of the office of the Controller of the Currency, Mr. Williams believed that he had done all that could be incumbent upon him under the circumstances.

Wall Street leaders have denied time and again that their banks either control or hold the bulk of the money of the United States, in spite of the Federal Reserve System, which as managed has been virtually inoperative in this instance, but the fact is, as has already been stated in the columns of THE DEARBORN INDEPENDENT, that commercial banks in many parts of the country have been seduced by unnatural interest rates in New York City into sending funds away from home to be loaned in Wall Street at those exorbitant rates. I have, of course, Controller Williams' word in support of this allegation.

It seems that every business day a group of brokers, members of the New York Stock Exchange, get together for consultation on the floor of the exchange, or by telephone, and determine what, in its view, is the proper rate for the renewal of all street or brokers' call loans for that day. As soon as the rate is agreed upon it is posted and then sent over the ticker to all the banks. This rate is binding upon the out-of-town correspondents unless other special arrangements exist. Banks everywhere mark up or down, as the case may be, upon virtually all of their brokers' loans.

Of course, it is often imagined by the people that the usury laws are drastic enough to prevent high-interest abuses, but such is not the case. Under the New York banking law, it is lawful for a lender to charge any rate of interest which may be agreed upon with the borrower on a demand loan for $5,000 or more secured by stocks, bonds, or other securities. This provision enables lenders to escape penalties for usury which exist in nearly all of the other states. Is it any wonder that money gravitates to New York?

That is why money legitimately belonging to a small community is manipulated by the bankers so that it shall find asylum in the metropolis, to the detriment of the local depositors and their financial requirements.

87½ Per Cent Per Annum!

SMALL banks are subjected to penalties or special charges. Controller Williams has called the country's attention to a little member bank in Alabama, temporarily deficient in reserve, and because of this technicality was forced to pay penalties which in one instance meant 87½ per cent interest per annum. Other instances are mentioned in the official records where member banks borrowing heavily from the Federal Reserve Bank of New York at six per cent were exacting interest rates ranging from 20 per cent to 100 per cent from customers at their mercy.

This, too, while the New York Reserve Bank loaned to TWO member banking institutions in that city, both conspicuous for their speculative activities, $250,000,000, while—mark this difference—six other Federal Reserve banks (Districts 1, 2, 3, 4, 5, 8) had loaned to about 4,000 member banks $15,642,000. This means that these banks obtained an average of $3,875 loans against the ratio of $125,000,000 for each of two privileged New York banks.

It has been alleged by apologists for the Money Trust that these New York banks borrowed in order to lend to correspondent banks. Theoretically, yes, but actually, no. Mr. Williams has said that one of the borrowing banks was lending to its own chief executive officer and his immediate family, largely on speculative securities, more money than his bank at the same time was lending to all of its national bank correspondents throughout the United States.

In many cases, as Mr. Williams has attempted to expose, secret methods have been adopted by the officers of these banks in using the funds of their institutions. His examining force was constantly discovering new means and methods whereby the officers and directors of banks sought to camouflage or conceal their heavy borrowings, such as "family" corporations, dummy loans and private "syndicates."

Spending Money for Palaces

OF LATE, the public has sporadically heard about waste of money for banking palaces. They have not heard that Mr. Williams has said that five or six millions could have been saved in the administration of the New York Reserve Bank last year, "if it had been run with a proper regard to intelligent administration and economy, and of the amount to be saved, 90 per cent would have gone into the Federal Treasury."

It is probable, from what I know of Mr. Williams after an acquaintance of nine years, that he would not have gone very far into a discussion whose object would have been the building of a $25,000,000 bank in New York with public money. Nor that he would have approved an expenditure of $50,000,000 in four cities at a period when the Congress ceased authorizing new public buildings. At the end of last December the Reserve Bank of St. Louis numbered a staff of 517, while that in Cleveland numbered 598, with this difference—that it cost the St. Louis bank $987 per capita and the Cleveland bank $14,063 per capita to house their respective employes. Mr. Williams emphatically declares that surely there is "something rotten in Denmark."

Yet the national scandal, as it has been termed, has been headed for oblivion. "What is the reason the newspapers ignore it?" one of Mr. Williams' correspondents wanted to know. "Believe me, they would not have ignored it 25 years ago; nor the magazines 15 years ago.

"The fact of the suppression is more momentous than the scandal that is suppressed, tremendous as it is. These are disquieting conditions."

A few thousand dollars involved in any sort of mismanagement, public or quasi-public, was sufficient for editors a decade ago to devote pages of space to it for months, under the direction of their star reporters. One may ask—what has become of these star reporters? What are they writing about today?

New York's "Curb" Limbo of Lost Investments

Concluded from page 10

share by Boston interests in 1915. Selling on the Curb today at 60 cents.

Tonopah North Star Tunnel & Development Company. H. Zadig, president. Since 1916 the company has made sundry shipments, but not sufficient to meet expenses.

La Rose Mines Company. Shares $5, reduced in 1917 to $1. La Rose is a liquidating property. Shares selling at 25 cents.

Jumbo Extension Mining Company. Idle save for work at its subsidiary, Jumbo Mountain Mining Company. Reported that the company was recently about to abandon the latter mine, as the owners demanded $50,000 due on the purchase price.

Yukon Gold Mining Company. President, William Loeb, Jr., one-time secretary to President Roosevelt. Dividend payments suspended 1918. Report for 1919 showed deficit of $1,108,684. Marketed by a Boston operator at $7.50 a share. Selling at about 75 cents a share.

Some of the Oil Stocks

SO MUCH for Curb mining shares, some of which have been producing properties, some having paid dividends, but all of which have proved unfortunate to the investor. American mining management has always been subject to criticism. Promoters run the initial stock issues up to ridiculous figures. The purchasers, although they may receive dividends for a period of years, rarely obtain their capital back by the time the mine is exhausted. The English adopt a more equitable system. It is their custom to retire a certain amount of the stock with every dividend, on the theory that the more you take from a mine, the less remains.

It is said that nearly 50 per cent of the active members of the New York Stock Exchange obtained their training on the Curb. Also back in 1917, it was estimated that approximately 90 per cent of the business transacted on the Curb came from Stock Exchange houses. Of course, this is no longer true today. But it is a fact that very many of the Curb stocks have been sponsored by Stock Exchange firms, this is more especially true in the oil shares.

We may take the case of Simms Petroleum. Incorporated in 1919, the stock of the company was marketed by a reputable Stock Exchange house on the Curb at $71.50 a share. Later it was sent still higher. Two years afterward, a Texas lease, carried at a cost of $6,700,000, was abandoned, reducing the book value of the original Texas acreage to $3,200,000. The income account of the company showed a deficit on December 31, 1920, of $2,426,300. Today this stock is selling at from $9 to $10 a share.

In other words, wealthy men, willing to adventure into a great oil gamble, asked inexperienced persons to advance the money for financing the game.

Next we may cite the Island Oil and Transportation Corporation, which was incorporated in 1917. This concern also was sponsored by a Stock Exchange house of established reputation, and the shares were sold at $10 on the Curb. They were listed on the Stock Exchange in 1920. No dividends were ever paid. The company passed into the hands of receivers in 1922. The most recent statement is that the stockholders may lose their all. Today this stock is selling at 65 cents a share.

The Invincible Oil Corporation was fathered by a group of the Stock Exchange and sold on the Curb in 1919 at $49.50 a share. It has never paid any dividends. Today it is selling at about $13 a share.

The shares of the Allied Oil Corporation represent one of the scandals of the Curb. It is needless to go into the details. Claims were made against the company by a Curb broker for marketing its shares, and these claims could not be met. This stock was marketed in a blatant way in 1919 at $1.50 a share. Today it is selling at two cents a share.

To Young Man With $1,000

BOONE Oil was listed on the Curb in 1917. The shares were marketed for $16.50. No dividends have ever been paid. The management stated its inability to redeem the notes which it had sold. Today, Boone Oil is selling at about 12 cents a share.

The young man who has saved his first $1,000 may find it trying to shut his eyes to the tempting bait of speculation. But it should be easy to prove to him the folly of placing his initial capital at random in the mining or oil shares of the Curb.

The tables as given below illustrate the losses suffered by the small investor who gambled. They also show what his capital would have amounted to today had he placed his money in a savings bank, or in a sound investment:

Gambling vs. Thrift	What his account would show today
If he had placed $750 in the savings bank at 4 per cent in 1916	$ 930.00
If he had bought 200 shares Emma Copper for $750 in 1916	0
Advantage of the investor over the speculator	$ 930.00
If he had deposited $1,000 in the savings bank at 4 per cent in 1915	$1,280.00
If he had bought $1,000 worth First National Copper in 1915	60.00
Thrifty man's profits, compared with the speculator's	$1,220.00
If he had bought Liberty bonds at 4 per cent in 1919	$ 829.40
If he had bought 10 shares Simms Petroleum at $71.50 in 1919	100.00
Difference between investment and Curb speculation	$ 729.40
If he had bought a bond in 1917 at 4 per cent.	$1,200.00
If he had bought 100 shares Island Oil at $10 in 1917	65.00
The investor's gain over the gambler's	$1,135.00
If he had bought $900 in 4 per cent bonds in 1919	$1,044.00
If he had bought 600 shares Allied Oil at $1.50 in 1919	12.00
The gambler's potential loss	$1,032.00
If he had put $1,650 in the savings bank in 1917	$1,980.00
If he had bought 100 shares Boone Oil at $16.50 in 1917	12.00
Where oil speculation does not pay	$1,968.00

These examples should leave little room for further comment over the difference between gaining an assured competence or hazarding one's savings in speculation.

Lincoln's Home Fires Kept Burning at Cost By "Brother Charley" Bryan

Profiteering in Coal Ended by Nebraskan's Activity

By H. T. DOBBINS

THE home fires in the city of Lincoln, Nebraska, were kept burning during all the past winter at cost. The reason was that on October 1, 1921, the city itself entered the local field as a retailer of bituminous coal after Commissioner Charles W. Bryan had found no disposition on the part of the 21 dealers to readjust prices.

During the winter the municipal yard sold 6,907 separate orders totaling 8,484 tons at a price averaging a little more than $10 a ton. It did a cash business in six months of $85,440, and not only saved to the people who patronized it approximately $34.000, but it saved for those who patronized the local dealers, who were forced by city competition to shave their prices to leave little or no profit.

This has not been the first time that a municipality in America has sought to use a publicly operated yard as a regulator of competitive prices of fuel, but this experiment was attended by so many spectacular features that it constitutes a tale worth telling. Commissioner Bryan is a brother of William Jennings Bryan. In all the years of the latter's political activity it has been "Brother Charley" who has plotted all his political strategy, who has been his confidential agent and who has planned many of his campaigns. He lacks the readiness of speech that characterizes his brother when it comes to making public addresses, but the fertility of his mind and the activity of his brain are evident in even the most casual conversation.

From 1915 to 1917 Charles W. Bryan served as mayor of Lincoln. He entered the contest to put across a number of municipal government reforms. During his campaign he announced that he proposed to give the city dollar gas. Nine years before the city had passed an ordinance fixing the price at a dollar, but the company, one of the Henry L. Doherty syndicate properties, had held it up by injunction process in the Federal courts. Mr. Bryan proposed to put in a city plant. Before the election the company capitulated and put in dollar gas. Five months after Mr. Bryan's term expired it put the price back to the old figure. Only a few months ago, following a Federal Supreme Court decision upholding the ordinance, the company paid several hundred thousand dollars of overcharges back to its patrons.

During January of 1921, Mr. Bryan, after an investigation of the cost and selling prices of coal in Lincoln, recommended to the city council that it establish a municipal yard. He said he was convinced that a first-class bituminous coal could be sold for $4 a ton less than the current figures. The members of the council backed and filled on the proposition, but finally refused to embark in the business.

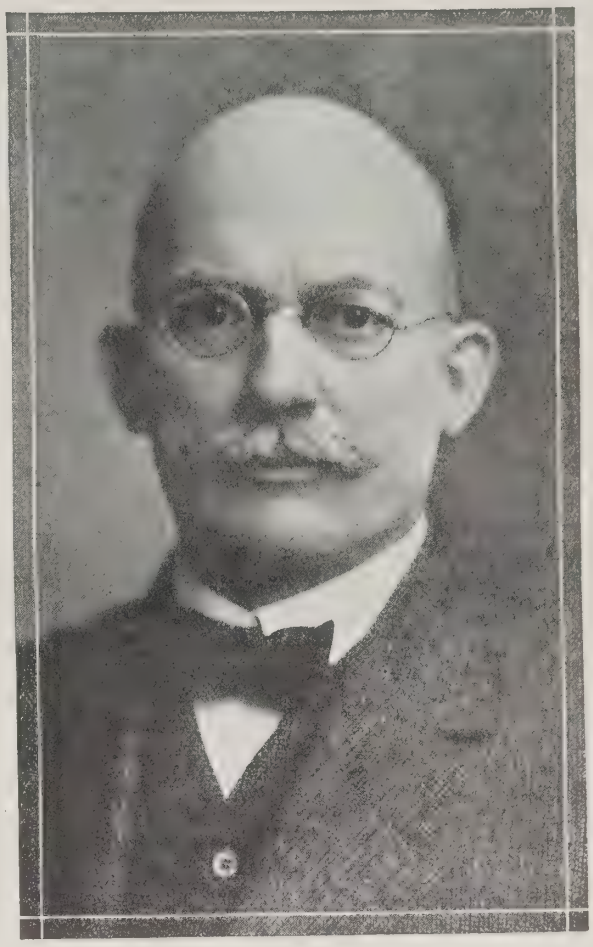
Thereupon Mr. Bryan announced his candidacy for mayor on a platform that provided for a municipal coal yard, a municipal public market and a municipal ice plant, after he had been unable to induce several well-known business men to make the race. Immediately he became the center of a very active fight, financed largely by the coal dealers, he says, and backed rather solidly by the business interests. Half-page advertisements in the city newspapers warned the other business men that if Mr. Bryan were successful they might expect to see municipal groceries, municipal dry goods stores and so on down the business list.

At the election in May, Mr. Bryan received 652 more votes than did his opponent for mayor, but the council seated the latter as mayor and gave him the position of commissioner of streets, the object being, as Mr. Bryan firmly believes, that this would retard or make impossible his municipal ownership program. This arbitrary sidetracking of Mr. Bryan was made possible by the fact that Lincoln operates under the commissioner system, by which five men are elected as commissioners and from their number the five choose a mayor. Mr. Zehrung, who ran against Mr. Bryan in the popular contest for mayor, was made chief executive because he also was elected as one of the five and the other three did not want Mr. Bryan to be at the head of affairs. The matter aroused great indignation among Mr. Bryan's supporters, but while they could have ordered a recall election upon Mr. Zehrung, they were unable to obtain a desirable candidate to make this race.

"As the city commission stood four to one against the municipal ownership program," says Mr. Bryan, "it was deemed necessary to organize public sentiment to bring pressure to bear on the members to induce them to give to the people what they had declared for in the election. Before introducing the municipal coal yard ordinance in the council, petitions were put in circulation under the initiative and referendum to establish such a yard by direct vote. At the same time petitions were drafted to recall two of the city commissioners and replace them with men pledged to my municipal program that it might have the backing of a majority.

"While these were being presented to the voters the ordinance was introduced, and after being voted down one week was brought forth again at the next meeting. Public sentiment had been aroused by the first defeat, and manifested itself so plainly that at the second meeting all five members voted for it. The four that opposed it but who yielded to the public demand placed it in my department and made me responsible for its success or failure."

The coal dealers at once applied to the district court for a writ of injunction. They denied the legal right of the city to compel them to pay taxes for establishing a yard created for their undoing, and attacked its power under the charter to engage in such an enterprise. The district court denied the injunction, and held that the city had the right to buy and sell coal. The dealers appealed to the Supreme Court, and there the case rests at the present time.



Meanwhile, Mr. Bryan organized his buying and selling forces. He found himself hampered at the beginning in securing the supplies necessary. The private dealers sought by various means, he says, to prevent his buying coal from any of the mines or from the big jobbers, but he soon found a wholesaler who, in consideration of the big trade promised by a city yard, agreed to furnish him the kind of coal he wanted, and did so during the entire six months of its operation.

Mr. Bryan established a price of $10.50 a ton delivered for Franklin County, Illinois, coal. Immediately the dealers began a campaign against it. They attacked its quality, declaring that it was not as represented, and that they were offering just as good coal for the same or less money. Mr. Bryan, while refusing to disclose where he was buying his coal, declared that it was exactly the same kind of coal that before he began operations was being sold by the dealers at $14.50 a ton. He said that at that time, a month after he began, the dealers had already reduced their price on the same coal $2 a ton, although the price at the mines had been advanced from 50 to 75 cents a ton since the February, or spring, quotations.

The city council had appropriated, at the beginning, a revolving fund of $15,000, but this was never used, the price at which the coal was sold yielding a profit that enabled the city to finance its own operations. The first of January, finding that this profit was larger than was necessary, he reduced the delivered cost from $10.50 a ton to $9.90, and continued it until the winter season ended.

The municipal yard handled but the one grade of coal, although during the winter there was a big demand for it to sell semi-anthracite, and later steam coal. Mr. Bryan says that the dealers made this unnecessary by reducing the price of the semi-anthracite, a large amount of which is used in home furnaces.

Mr. Bryan was too busy with the municipal coal yard to embark upon either the municipal ice plant or the public market. Indeed, the ice company—there is but one in the city—did not wait for him to turn

CHARLES W. BRYAN

his competitive business batteries upon it. Before his coal yard had been fairly started a meeting of business men was held at the chamber of commerce, and acting upon the advice of those who were in attendance, the company announced a schedule of prices that met in every respect the figures at which the Omaha municipal ice plant was selling, and which were low enough to make city competition inadvisable.

A conservative estimate of the saving to Lincoln people during the past season on their coal bills would be $150,000, says Mr. Bryan. It will be reopened October 1 next unless the Supreme Court forbids.

Since the yard has closed, the dealers, by an attorney, have made a demand for the inspection of the city's list of customers. Mr. Bryan has refused this. The dealers declare it is a public document, and intimate that if he does not produce it they will resort to court proceedings. He says he will not comply with the request because he fears that it will be used as a weapon of boycott against patrons should there be a shortage following the coal strike.

Community Players Are Americanizing the Drama

Concluded from page 9

character, they have written and staged, with local talent, in Carolina towns and cities.

There are secondary schools in the East, though, which have gone the way of the community theater and which give high-grade plays under competent direction. One evening high school in New York has a group of juvenile players who even write some of the plays they put on and who have a workshop in which they make scenery and costumes.

At the same time, it is in the cities that the community theater has had to stand quite on its own feet and make a place for itself in the face of whatever the odds might be. It does stand there, securely and serenely; it has more than made good; and the future can be but one of growth and accomplishment.

Even the summer theaters have become settled institutions whose work in the warm months each year is well worth attention, as instance those at Mt. Kisco, New York; Peterboro, New Hampshire; Ogunquit, Maine, and the Playhouse-on-the-Moors at Gloucester, Massachusetts; not to mention the Provincetown Players, which organization began in that summer resort of the talented in art and letters and now has an established position and its own theater in New York City. It produces only original plays, moreover.

Before considering the situation in New York, there is New England to think of. The Theater Guild in Boston is a flourishing example of what the little theater can become; the Providence Players have their own playhouse and Hartford and Bridgeport, Connecticut, have successful little theater guilds.

Art is not to be thwarted through lack of a roof, and several other little theater groups in Greater New York command large followings in rented theaters, among them the Stuyvesant Players, the Mummers, the Portmanteau Theater and others in Manhattan; the Institute Players, of the Brooklyn Institute of Arts and Sciences; the New Brighton Players, of Staten Island, and the Gardens Players of Forest Hills.

In the New York suburbs there are similar groups. The Beechwood Players, of Scarborough, in Westchester County, have their own theater. Then there are the Fireside Players, of White Plains, and over in New Jersey the Little Theater Guild and Barringer's Thespians, of Newark; the Summit Players in Summit, and the Montclair Players in that fine suburb.

Among organizations of the kind which have made their mark across the country are Plays and Players, of Philadelphia; the Amateurs, of Rochester, New York; the Guild Players, of Pittsburgh; the Vagrant Players and Everybody's Playhouse in Baltimore; the Little Theater, of Richmond, Virginia; the Little Theater, of New Orleans; the Players and the Artists' Guild in St. Louis; the Little Theater Society of Indiana in Indianapolis; the Little Theater at Miami; the Little Playhouse, of Cincinnati; the Ypsilanti (Michigan) Players; the Art Academy Players, of Colorado Springs; the Little Theater in Denver, and the Arts and Crafts Little Theater, Detroit.

Santa Fe, New Mexico, has a particularly flourishing community theater, which is managed by the Drama League and is open to any group of players in the city. This even includes Santa Fe's numerous Spanish-speaking population, groups of which give Spanish plays in this playhouse. Revivals of old Spanish dramas have been so successful as to excite no little interest, especially in the case of three of considerable importance, "Los Pastores," "Los Comanchos" and "The Lady of Guadalupe."

Among the California community theaters which stand out are those at Carmel, Bakersfield, Montecito, Mt. Tamalpais, Point Loma, Pasadena, Hollywood and the well-known Berkeley Theater at Leland Stanford University. Their ways differ, and somewhat the scope of their activities, but each is of real potency in the life of the community and much more than merely a group theater.

The famed Hilltop Theater, on Mt. Tamalpais, a day's pilgrimage from San Francisco, is owned by the theater society and is ever at the service of the public. The lovely Forest Theater at Carmel is in the hands of a stock company formed of the literary folk, of whom so many make their home there. Truxton Beale built that at Bakersfield, which is held in trust by trustees and may be used by any coterie of players. The Berkeley Theater was given to the public and to be conducted under the university's auspices, and this is sometimes used for professional performances approved by the latter.

U IV OF ILLINOIS
URBANA ILL

BRIEFLY TOLD

A temperature of more than 50,000 degrees—20,000 degrees higher than that of the hottest stars—was obtained in a recent experiment at the University of Chicago by discharging a large quantity of electricity from a condenser through a very fine wire. The metal tungsten was actually changed to helium by means of this enormous heat.

A silk floss cotton or silk cotton, known as Kapok, is obtained from the fruit of a tree found in the Dutch East Indies, Ecuador, Brazil and India. The yellow silky mass is taken from pods and dried on cement floors.

Thomas R. Marshall would disfranchise all who cannot speak, read or write the English language. He said, "I'm for the melting pot, but if there are any lumps in the pot that won't melt let's get rid of them."

Chinese students attending the University of Chicago avail themselves of 20,000 books of Chinese, Japanese, Mongolian and Tibetan literature, history and philosophy in the library. This library reports the possession of 401 books printed prior to 1500.

The Philippine Islands were dry April 29, 1922, for the first time in history, under a law passed by the last legislature prohibiting the sale of spirituous liquors on registration and election days.

Quail are classed as songbirds by the Minnesota State Humane Society. The executive committee of the society has adopted resolutions urging the farmers of all states where there are quail to feed and care for them because of the fact that the small amount of grain expended would be abundantly repaid in the destruction of seeds of noxious weeds and insect pests.

Chauncey M. Depew, aged 88, states he never played golf, never rode horseback, never played tennis, never went hunting and never even saw a baseball game.

The climate of South Africa is particularly adapted to fruit-growing. Pears, apples, plums, peaches and grapes are extensively and profitably grown on the highlands as far north as Rhodesia, and tropical fruits are found along the west and east coasts.

The art of pottery and basket-making is being taught various Indian peoples of Mexico by means of the motion picture. Many tribes know the art in an extremely crude manner, and the government wishes to teach them more modern methods. The pictures are supplemented with lectures because of the large number of illiterates.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

A group of capitalists has submitted a scheme to the British Government for using five lighter-than-air airships for a weekly passenger service to Australia and India. A new carburetor, using gasoline or oil combined with hydrogen, is a factor adding strength to the feasibility of the scheme. This will permit the shipload to be increased 40 per cent. The journey to Bombay would be reduced to five and one-half days and to Australia to 11½ days. The fares would be 85 pounds to India and 130 pounds to Australia. This is 30 pounds less than first-class mail steamship accommodations at present rates.

The picture of the man shown in the issue of THE DEARBORN INDEPENDENT of May 6, page 6, as that of J. F. Jones is that of J. G. Rush.

In China any citizen who abandons any of his lineal ascendants shall be liable to penal servitude for life or for a term of from five to 15 years and shall upon conviction be deprived of all civil rights.

Tonga, a little kingdom of 100 isles, is the one remaining independent state in the Pacific, and, though under British protection, it still flies its own flag. It is a limited monarchy and the British consul is the real power. There is no poverty or wealth in Tonga, as the tribal system is altogether opposed to any member of the tribes accumulating property. Tonga is said to be the only country in the world without a national debt. Every one of the 20,000 adults in the kingdom can read and write their language.

The waters of the River Jordan in Palestine are to be developed into power to turn the wheels of new industry. The British Government has granted a concession for the utilization of the river for 70 years. The energy obtained will be used for house and street lighting, pumping, water supply, railways and many other purposes.

To force tax dodgers out into the open, the Nebraska State Farm Bureau Federation has made arrangements for representatives in each county in the state to make a copy of the personal tax returns made by every taxpayer and to post these lists in conspicuous places in each district. This plan is approved by the state tax commissioner.

A forest ranger in Northern Minnesota, seeking authentic information of the approximate number of fires that will kindle from cigarets, walked one mile throwing lighted cigarets along the rail. Twenty cigarets were used in this manner and upon his return he found that 19 of them had started small fires. This experiment was tried in the dry peat country. When peat is dry it kindles very easily.

After baffling mountain climbers for years, the great Mount Alagheuz, in the Caucasus, has been ascended by two American college athletes. This mountain rises 13,800 feet from a broad plateau 30 miles east of Alexandropol, Armenia.

Indians from Montana, California and British Columbia will join the Yakima Indians during a big fish carnival held at Prosser, Washington, to celebrate the victory of the Yakimas over the state of Washington. For years the state has tried to exclude the Indians from spearing salmon at the falls as the fish are on the way up the river to spawn. The Indians, beaten in state courts, went to the Supreme Court of the United States and their case was upheld by the highest court in the land. Salmon caught in this manner is dried and smoked for winter food.

One hundred new missionaries have been sent out to Japan, China, the Philippines, Alaska and other fields, by the Protestant Episcopal church during the last year.

The wheat crop of India is estimated at 9,500,000 tons, as compared with 7,000,000 tons last year. There will be a surplus for export.

Cuneiform inscriptions of 2400 B. C., found in the ruins of a Babylonian town in Asia Minor, reveal that the city was ruled by a prince and a princess, together with a male and female prefect. The powers of the princess and the prefectess were precisely equal to those of their male colleagues.

Phonograph records are being used by the Linguistic Survey of India for preserving the native tongues, many of which have never been put on paper. Sets of these records will be deposited in British university libraries, in the British Museum and at the Institute of France in Paris.

Where Great and Near-Great Become Human

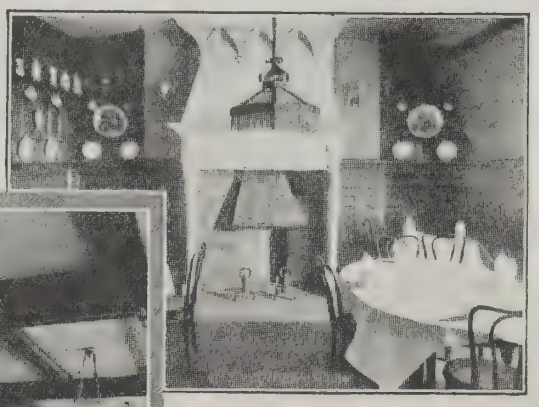
A Glimpse of the Rendezvous of News-Gatherers in Washington

By AARON HARDY ULM

THERE are clubs which boast of their "dignity" and "exclusiveness," clubs which are taken with great seriousness by their members and which treat august guests, such as public men of note, as if said guests were institutions rather than human beings. There is one club, which is the leader of its kind, whose lexicon does not include the word "dignity," and doesn't know the meaning of "exclusiveness." Yet among its members are many of the most distinguished men of the world and it has entertained more famous persons than any other club in America has done in recent years. And it as readily gives a "blow out" to a prize fighter as to a famous statesman, and will treat either just alike—as a human being and nothing more.

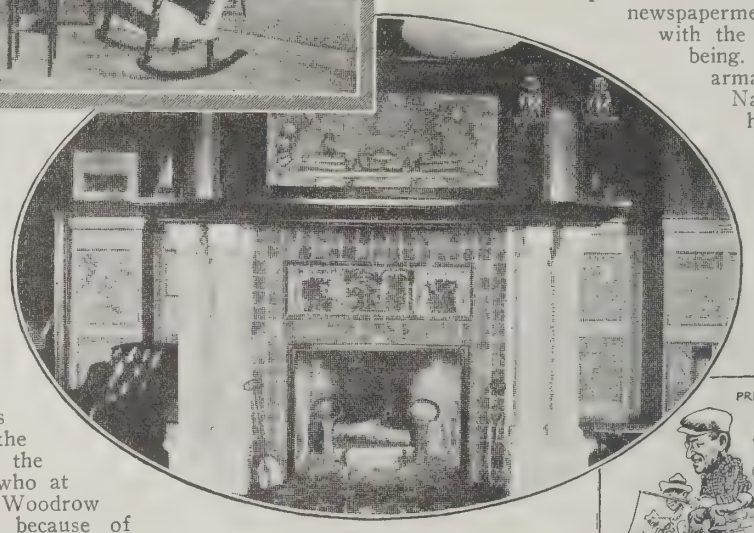
The club is the National Press Club of Washington, D. C., the largest newspapermen's social organization in the world.

The National Press Club is unlike the famous Gridiron Club in that it is more inclusive. It is an all-round club, with a club house that never closes, while the Gridiron is only a dining club, has no club rooms, and exercises no functions other than its two or three dinner entertainments each year.



Most of the limited number of members of the Gridiron Club also are active members of the National Press Club, whose active membership is not limited except by occupational requirement. All active members must be active newspaper workers or writers at the National Capitol. There are nearly 500 of them. Although they have control of the club, being the only members entitled to vote and hold office, there also are a few hundred non-active members and several hundred associate members and a large number of non-resident members. The non-active members are former newspaper workers or writers who have drifted into other lines of activity. The associate members are laymen who come in close contact with newspapermen, and the non-resident members in the main are editors and writers located in cities other than Washington. All told, the club has about 1,500 members, nearly 1,000 residents of Washington and more than one-half of them active or one-time active newspaper workers.

The National Press Club, unlike most press clubs, few of which are rousing financial successes, is absolutely independent. It has never "passed the hat"—that is, appealed to outsiders for help in making ends meet and, it is controlled wholly by working newspapermen and other writers.



One reason for that is the large and growing number of working newspapermen domiciled in the national capital. Another is the practical worth to them of an occupational club. A third reason lies in experience gained from a long series of failures of attempts to develop and sustain a real press club in Washington—failures that have been rather common to the journalistic world elsewhere. The present press club of Washington is the descendant of several organizations, some formed as long ago as Civil War times, which seemed to prosper for brief periods and then were shattered on the rocks of disaster, through many causes. It is not a "lineal" descendant, for it was born, wholly anew, as recently as the year 1908, when the police headquarters reporters for the local Washington newspapers got together early one morning, while awaiting "closing time," and planned its beginning. At a later and larger meeting, held at a fire house, William P. Spurgeon, then and until his death managing editor of a Washington paper, was elected president and an organization campaign begun. From modest beginnings by way of membership list and club quarters, the organization grew until a few years later it was able to take over and occupy its present quarters, which comprise most of the top floor and the roof of one of Washington's largest and most centrally situated office buildings.

The Assembly Room.

The Flemish room.

The Fireplace.

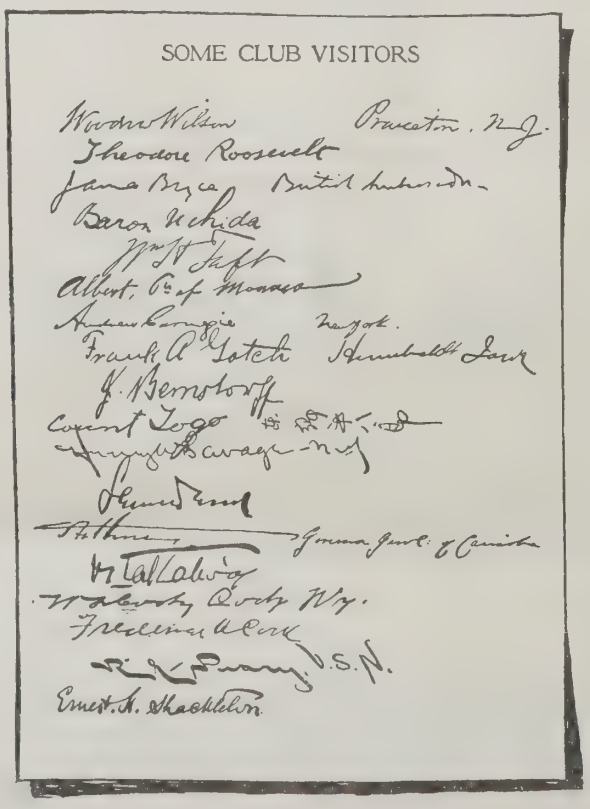
When the club's quarters as they now stand were opened in 1914 the "feature" of the occasion was an address by the President of the United States, who at that time was Woodrow Wilson. It is because of such "features" in its life, as well as other characteristics of general interest and significance, that the Washington organization of news-gatherers and writers is worthy of this "write-up."

The Woodrow Wilson "feature" mentioned is among the best of the numerous classical "stunts" that have given the National Press Club wide fame. It consisted of a man-to-man talk on how it felt to be President of the United States. It was an extemporaneous address and Wilson, not expected to be quoted, let himself go in the most intimate way. He told of how he never expected to see much of Washington until his term ended, for the reason that whenever he went out to look around he became an object of curiosity like the Washington monument and was so attended that he couldn't see anything except his attendants. That was the occasion when President Wilson said that he often was tempted to put on a false beard and otherwise disguise himself and thus be able to knock around and be knocked around like a human being.

The speech, having nothing whatever to do with public questions, created something of a sensation because it was an unusual one. Although it wasn't delivered to be published, President Wilson was induced to "release" it.

In that the National Press Club differs from the Gridiron, which as a rule never gives those who speak at its dinners even the permission of "releasing" copies of what they say. At the press club reports of speeches made there are published only when the speakers give consent.

During the war many talks of which no reports went out to the country were made at the National Press Club by important personages. When, on our entrance, the allied governments sent their war missions, many of the biggest figures in Europe visited the club and talked over the situation confidentially with the correspondents. Balfour, who headed the British war mission, visited the club twice. Later, while he was serving temporarily as British Ambassador, Lord Reading delivered there an address that was published. On that occasion former President Taft presided. Recently, on his visit to this country, Marshal Foch, accompanied by General Pershing, gave an evening to the correspondents. As an indication of National Press Club catholicity it may be noted that on the occasion of the *Marechal's* visit Foch was preceded on the evening's bill of entertainment by a distinguished sleight-of-hand operator. The Prince of Wales on his visit to Washington likewise visited the press club, gave out there a prepared "message" to the American people but made a different speech—and a very human one—to the newspapermen and afterward mixed with the boys like a real human being. During the recent Disarmament Conference, the National Press Club was headquarters for visiting correspondents, general writers and diplomatic attachés from all over the world. Nearly every prominent American public man has at some time been the guest or the "subject" of a National Press Club "blow out."



The peculiar standing with important personages of the newspapermen's Washington club isn't due to any "intellectualism," as you might imagine would pervade the atmosphere of a rendezvous of writers. Nor is it due to any particular social prestige enjoyed by the club. There are in Washington other clubs, such as the Cosmos, which appeal more distinctly to the "intelligentsia" and numerous others that are more popular with social climbers.

The press club is distinctly one of workers. While it is doubtful if the members of any other similar organization in America exercise so great a power over the thought of the nation, it would be difficult to find one where there is less of that sort of atmosphere that goes with "heavy thinking." Dominoes figure much more prominently than do books in the daily life of the club. And when a statesman is dragged forth to provide edification for club members, he is more likely to be assigned for discussion such a subject as "The Merit of Bowlegs Over Knock-knees" than such a one as "The Trend of the Times."

In fact, the most famous of National Press Club affairs have been debates of frivolous subjects by big men, or "hobby nights" when prominent personages were brought forward to tell of their lighter and least serious interests.

Imagine two ponderous United States Senators debating with two long, lean and hungry-looking Congressmen the question of whether it is better to be fat or to be skinny and you have a vision of a most typical National Press Club affair. A debate of that kind was pulled off in one of the Washington theaters last year. Speaker Gillett, of the House of Representatives, presided and a Justice of the Supreme Court opened the occasion with a reading of a serious poem. On another occasion, a "hobby party," even Sir Auckland Geddes, the British Ambassador, and President Harding made

What of the Carnival "Under Auspices of–"?

Declared Grave Menace to Communities They Visit During Season

THE CIRCUS, THE BOY AND THE "CARNIVAL"

The circus as we know it is peculiarly an American institution. The boy follows every step with the keenest interest and after the performance rigs up a trapeze in his back yard. Bruised shoulders and a bumped head cause him to have renewed respect for the men and women of the circus ring. This influence is wholly good.

The carnival has a similar appeal. But that which is under the canvas is vastly different. At most of the carnivals he sees the cheap fraud show with its lewd appeal. He sees gambling going on under the auspices of his father's lodge or his brother's war veterans organization. Just as thousands of boys would never have seen an elephant had it not been for the circus, so thousands would never have known of the roulette type gambling had it not been for the cruising carnival.

The "lot" of a typical cruising carnival.

By ROBERT KENTON

This is the first of two articles on the "Cruising Carnival"

THE popular mind judges civic morality largely in terms of density of population, and in a measure it is right. However, there are some things for which the moral consciousness of the big "immoral" city won't "stand" but for which the small town or small city or rural community will. Recently, for example, 10 men were bound over by a New York City police court for trial in a higher tribunal on the charge of operating an improper amusement venture. Yet the kind of amusement for the production of which they were held as criminals is not only permitted in the vast majority of small towns and cities but is welcome at places, such as agricultural fairs, where rural people come chiefly for diversion and entertainment.

The 10 men operated what is known as a "carnival show." Although it operated under the "auspices" of an American Legion Post, the New York police arrested the principals who, as stated, were held under bail for trial.

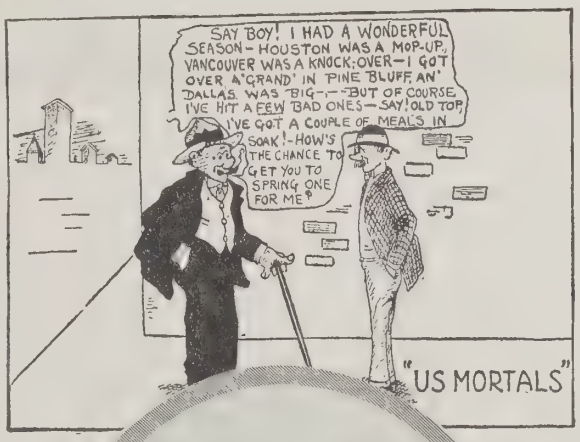
"A heated discussion materialized between Samuel Goldstein, attorney for the prisoners, and Inspector Dominick Henry, who supervised the raid, when the case was called for trial," says a theatrical paper's report of the event.

"Goldstein maintained the carnival was being conducted for the purpose of raising funds for disabled veterans and that he could produce plenty of witnesses to verify that all the material was supplied by members of the Legion. with 80 per cent of the proceeds going toward Legion purposes."

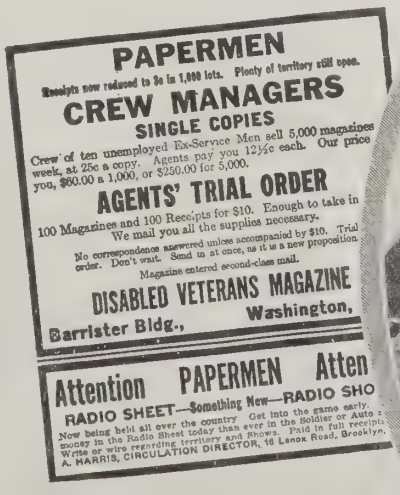
Inspector Henry stated that both the governor and the mayor had directed that such affairs be prevented. He "added that he was supplied with authentic information . . . . that the men operating the various devices were turning over only 10 per cent of the proceeds." He declared that 99 per cent of the attendants were children under the age of 17. "As a result of this condition," the inspector said, "carnivals are a great menace to any community for they are invariably improperly conducted."

"The real reason why traveling carnival companies always come to a town under the auspices of some local popular organization is because they all violate one or more sections of the state laws which prohibit lotteries, games of chance, gambling and indecent shows, and they need the influence of some local organization to protect them from police interference." That statement comes from O. R. Miller, superintendent of the New York Civic League, which has made extensive investigations of "carnival shows" and as a result has been endeavoring to have them outlawed—as they have been in a great many communities and, partially, in one state. Parenthetically, it is interesting to note that that state, South Carolina, outlaws them except when they operate at agricultural fairs, where, all agree, their worst features generally are in greatest evidence! The law protects the "boobs" of the town and city, leaving those of the rural districts to the tender mercies of the sharps who operate the "concessions" which are inseparable features of traveling carnivals.

"In our long experience in fighting these evils we have never known of a traveling carnival company which was not largely a combination of gamblers and lewd women," declares the aforesaid Mr. Miller. "The demoralizing effect of such carnivals is seldom realized by the people of the town. The disastrous results to the moral and physical health of the young men, where one of the carnivals spends a week, cannot be eradicated by the efforts of churches in a whole year.



In a Pennsylvania town, it is stated, the physicians traced 342 cases of certain types of disease to a traveling carnival company!



"How often you have known or heard or read of some girl being enticed away by a carnival or fair show," says an ex-concessionaire in the "Confessions of a Fair Fakir" published in *The Country Gentleman.* "Hundreds of farm girls have disappeared that way, swallowed up in the unhealthy, degrading life of the lowest type of carnival show . . . ."

Such disappearances have not been always wholly voluntary on the part of the girls, if what has often come out in court is true.

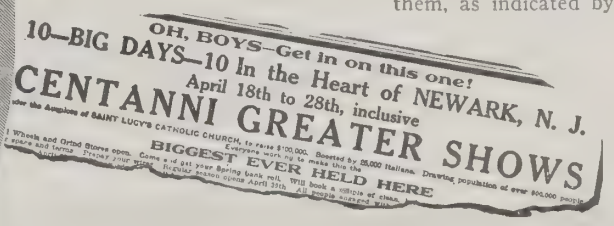
Last year in Chicago, a carnival show operator was fined $4,000 and given a 20-year sentence in the penitentiary for violating the Mann (white slave) Act. Four girls, all from small towns in the Middle West, were involved, all being with the man at the time of his arrest.

"Men of your type are a menace to the community at large," said the judge in passing sentence. "You should not be permitted to come into contact with society and it is only too bad that the law covering your offense is not more drastic. The death penalty is none too good for men of your ilk and caliber. But it might be a lesson to men of your vocation and business who have been plying this nefarious trade.

Some of the advertising that appears in the performers' publications makes interesting reading. A cartoon from the *Billboard* is at the top and in the oval is the "knock the baby" concession of a carnival.

"You go into communities, fill up young and unsuspecting girls with embellished tales of the wonders and opportunities of the carnival show business; you tell them how they will make money in abundant quantities and how jewels and fine clothes will be showered upon them by the thousands of admirers they will meet in towns they visit. They listen to your tales, do not know any better, fall and then come into the trap to be held at your mercy.

"I will sound a warning to men of your business in the most drastic terms I know, and that is by giving you the limit under the law, and I hope that this warning will echo throughout the carnival world and that it will be heeded to the extent of keeping these men away from this part of the country unless they want to take the consequences which may be worse than those you have to take."



Such is not an isolated case, as you easily can find by reviewing the files of *Variety,* a theatrical publication which for long has been denouncing the "carnival shows" as "the sewer of the show business." There you will find reports of numerous crimes against girls, even against little children, committed by the followers of "carnivals."

And it is to children that these "shows" pretend to make chief appeal! Aside from the merry-go-round and the other "rides," which happen to earn most money when operated most honestly, few of them make more than visual appeal to children. One visited by the writer is an exception—it has several good features that are maintained for small children only and, according to its management, at a loss. It was the one and only one where clean entertainment dominated all activities on the "lot."

What the average one of small-town caliber is like may be visualized from the following paragraph clipped from an Ohio newspaper:

"The ———— Shows, sailing under the name 'carnival,' are like boils on your person. A snake show, a wrestler who couldn't put down his own supper and a couple of boiled prunes that called themselves 'hootchy-kootchy' dancers in 'The Garden of Allah.' These two were well ballasted with hootch. The whole gang was a loving bunch—accusing each other of every crime, except murder—and in their spare time gave each other love taps with chairs and other things."

Often when cities forbid them, near-by suburban communities welcome them, as indicated by

the following which also comes from an Ohio newspaper:

"———— has officially recognized the carnival business and outlawed it. Still it anchors outside the city limits, populated with gambling devices and violating the spirit and the letter of the law. Each carnival is attended by a motley crowd of leeches that live on the weakness of others. Each has its quota of

Zero in Accomplishment

FOR utter void in the way of achievement, the history of Congress has no finer example than the soldier bonus bill.

The proposition to give the veterans of the World War a bonus has been discussed almost since the armistice. The present Congress has theoretically at least been giving the subject the most earnest consideration since the day it was organized. And the proposition has got nowhere.

Days, weeks and months have been devoted to the subject. A dozen different plans were suggested, considered, rejected. The President's views were sought, and obtained. It was stated in fairly clear language that he would not approve a bonus bill that did not carry provision for raising the necessary funds.

Despite this pronouncement, members of the Lower House of Congress kept up a futile bombardment on the White House, seeking approval of the most impossible schemes. This Congressman or that was daily announcing that this or that new bill would receive the approval of the White House. The President remained silent. Finally, the House passed a bill providing a bonus, and leaving the problem of taxation to kind Providence.

On the presentation of the measure to the Senate, it was confidently announced that the Senate Finance Committee would produce promptly a workable bill which would merit the President's approval. But the process was similar to that in the House previously. Now, after many weeks and months, the committee has reported a measure similar to that passed by the House. There is absolutely no assurance that the President will give it favorable consideration. Yet the Senators expect to pass it, and then preen themselves before the soldier voters this autumn as statesmen who gave their time and thought and *sincere* effort to obtaining *a bonus.*

As the matter stands, unless the President does a complete reversal, there will be no soldiers' bonus this year, at least. Veterans who hear Senators and Representatives mention the bonus during the campaign speeches this fall, should laugh them out of the meeting.

Similarly, any attempt to capitalize politically the other side of the question, should be accorded a similar laugh. There is a large element of the electorate opposed to any bonus, because of the burden of taxation it will impose. Senators and Representatives seek the support of this element on the theory that they have passed no bonus *providing taxation.*

There is little doubt that 99 per cent of the veterans would like to have the matter settled, passed in a workable form, or rejected finally.

There is little doubt that 99 per cent of the persons opposed to the bonus would prefer to have it passed or rejected.

But 99 per cent of the Congressmen seem quite happy in fatuous belief that by passing the bonus unworkably, they are pleasing both friends and foes of the bonus.

Selection at the Source

THE ease with which the diplomatic problems in connection with the establishment of a selective immigration policy have been solved should set at rest completely the arguments that an attempt to stem the current of undesirable aliens would bring us into controversy with foreign powers.

So quietly that almost no national notice was attracted, has come the announcement of E. J. Henning, Assistant Secretary of Labor, that through arrangements for "co-operation" with other governments, the United States will establish immigration outposts in other countries where prospective immigrants may be scanned and in effect sorted. Ticklish questions of international law had rendered such outposts doubtful. The result had been that hordes of undesirables were able to reach Ellis Island, where the force of their presence added strength to the pleas of sympathy, the demands of politicians and racial influences which were brought to bear to break down the barriers against undesirable aliens.

Mr. Henning, speaking at a luncheon of shipping men, some time ago, expressed his strong disapproval of the admission of aliens who come solely to make money, with no intention of becoming citizens, and who return to the land of their nativity with the great proportion of their earnings.

The justice of his opposition to such aliens is clear. They contribute to the country only an unintelligent labor product, valuable only in boom times. In return, they lower American standards immeasurably. In times of low productivity they are sheer burdens, often criminal burdens. Mr. Henning's speech seems to indicate that one of the factors in the undesirability of such aliens is their determination to return to the land of their birth. To us, that is the only encouraging feature. The sooner, the better. The longer they remain, the worse it is for America.

Mr. Henning quoted statistics showing that 70 per cent of the immigrants from a nation, credited with supplying cheap labor to this country, are persons of a mental age of 11 years or less. He designated another nationality whose immigration included 20 per cent of low-grade morons with a mental age of nine years. No comment on such a condition is necessary.

The only element of importance is this: There must be such a renewal of national interest in the subject of immigration that will compel Congress to enforce additional safeguards against the alien peril.

We call attention to the first of several articles taking up the problem with which Canada is dealing in handling immigration. It is not unlike our own, but there is a sanity in officialdom in Canada that refuses to be swayed from a righteous path by the sickly sentimentalism that so often characterizes interference by well-meaning but uninformed Americans.

Hurry

HURRY is a chronic American disease, an evil habit that has fastened itself, cancer-like, on our life, and has sent its roots deep down into our vitals.

Hurry is not speed. It is not energy. It is not the opposite of slothfulness. It is not a means by which great ends are accomplished.

A study of the men of affairs, who have made, or are making, history, will demonstrate that hurry is not a characteristic of the man who is doing things worth while.

There are exceptions, of course, but almost invariably the man of affairs is deliberate. He accomplishes much, but he does it calmly, measuredly, and according to schedule.

His schedule is so planned, perhaps, that every moment of the working day is assigned, but there is sufficient time for each task when its time comes. He does not hurry.

The hurrying man is one who, with immature plans, is trying to keep up with a poorly arranged schedule, and is always a little behind.

Hurry, because it involves lost motion, makes for inefficiency.

Some men imagine that hurry is a virtue, that their feverish activities help to keep them in the limelight.

Such activities may impress some persons, but not those who read below the surface.

Among the most reprehensible of the hurry tribe are those to whom traffic rules are anathema, and who are willing to take long chances to save 10 minutes in a trip to or from town.

It is this class that furnishes the daily menu of automobile casualties.

Perhaps the most effectual punishment for this type of individual would be to give the traffic officers authority to order every speeding car to the side of the road, and there padlock it for half an hour, or more, according to the gravity of the offense.

Another class of the hurrier who, however, injures only himself, orders and eats his meals with a rush.

One chef is quoted as saying that the curse of American cooking is the injunction, "Rush this order, please." Neither good preparation of food nor good digestion goes with such an order.

Whoever is living a hurried life is living a poorly planned, disordered, nervous, inefficient life, *and is meanwhile rushing the undertaker!*

The Profession of Librarian

FROM the aged "bookworm" of ancient times has recently emerged the "butterfly" of today, commonly known among the youngest of the coming generation as the "libary teacher." This is a curious phenomenon when isolated from the course of events which has brought it about, yet a perfectly natural one when we consider the ideals of democracy as they have been translated into the library.

In ancient times it was only the small minority of highly educated persons who used the libraries; the librarian seldom enters into our concept of libraries of that period. If in imagination we do people the library of Alexandria, for instance, with librarians, they are venerable ancients, bent with much poring over musty books, stealthily prowling through the vast, book-lined rooms of that splendid edifice.

At a later period studious monks in cloistered libraries guarded the precious and much-loved volumes, and even the audacity of a Mark Twain could not imagine a woman within those sacred precincts, much less place in her custody as librarian the priceless volumes.

But a new ideal has come to realization, the ideal of Democracy and its inseparable companion, Universal Education. As an indispensable aid to education the Library has come into its own, and with it has come a new, vital and worthy profession, or possibly it would be truer to say a very old profession become revitalized and broadened, that of librarian. The rank of the librarian is universally recognized; she is the medium between the reader and the books, through whom the vast storehouse of information and enjoyment is placed at the disposal of every person of this broad land.

As a live profession constantly broadening, the work of the librarian has gone beyond the mere dispensing of books, important as that service is. A servant of the reading taste, the librarian has also successfully essayed a leadership of that taste. To stimulate interest where it lies dormant, and to guide it as it rises to zest, are all tasks within the librarian's field of service. The children's story hour in many libraries, when the "libary teacher" leads the open-eyed children into unexplored realms of make-believe, and satisfies that persistent demand of all inquisitive and normal youngsters, "Tell us a story!" is at once a beautiful humanity and a strong preventive and corrective of the abnormal tendencies incident to our new ways of living. Beyond that comes the librarian's service to specialists in science and the trades, in music, art, sociology and economics.

Consequently, a conclave of librarians is today a most interesting and diversified group of persons. Together they comprise a living index of all human knowledge and of all the avenues of intellectual effort. Such a conclave honors Detroit the last week in June, when the American Library Association will hold its annual convention in that city.

The American Library Association "was founded in 1876 by a group of far-seeing librarians who were concerned with educational progress and who saw the great possibilities for self-education in the founding and development of libraries." Its chief purpose is "to assist in making books a vital, educational force in American life, and in making libraries easily accessible to all the people."

That this purpose has been abundantly fulfilled is shown by the magnificent libraries that now outshine most other edifices in our cities, by unnumbered multitudes of library patrons, and by the splendid personnel of the profession of trained librarian.

We Lose an Ambassador

THE pleasant relations between the United States and the Kerensky Government in Russia must close. Announcement has been made at Washington that Boris Bakhmeteff will retire as Ambassador Extraordinary and Plenipotentiary.

Mr. Bakhmeteff is unquestionably the most extraordinary ambassador ever accredited to our country. For five years he manifested the most extraordinarily diplomatic silence. If, during that period, he had opened his mouth for public utterance, the chances are that someone would have noticed he was here, and he would have lost his job. By keeping his own counsel, he succeeded in retaining the valuable perquisites of ambassadorial rank, though the government which accredited him had disappeared shortly after his credentials were accepted.

It was not until Senator Borah challenged his status several weeks ago, that the country as a whole knew that Ambassador Bakhmeteff was still with us. The Kerensky ministry was in such a hurry when it retired from office in Russia, that its failure to recall Mr. Bakhmeteff is entirely excusable. But notwithstanding the involved explanations at Washington, the mystery of why we kept him is too deep to understand.

Mr. Ford's Page

THE sign of superiority is service. Whether in race, class, individual or group undertaking, the only justification for any claim of exceptional worth or standing is that the claimant can prove a superior service in some particular to mankind. "Whosoever would be greatest among you, let him be your servant." This is the law of life. The only mastery is not over individuals, but over laws and processes and materials for the benefit of individuals.

But this sounds like moralizing. That is one of the greatest difficulties in bringing men to a realization of the true basis of progress—it sounds like moralizing. Men's minds have become so accustomed to the use of the word "service" in the accents of idealism that they find it almost impossible to break through to reality. They think that "service" is something they may render as extra measure over and above what they practically ought to do, a sort of generous gesture added to their proper work. Instead, service ought to be the very characteristic of all that they do, and even the man who works for wages should see to it, as a part of common prudence, that his efforts in shop or store or office are performing a real and needed service for the people.

But there is an overtone in service after all. Wherever superior advantages or opportunities have become the possession of any race, nation, class or individual, the very possession is an obligation to greater service. And it is in the failure to realize this that we may trace all the stupid dislocations of our time.

Here is the race difficulty solved. The inferior race does not rebel against its inferiority, nor does it rebel against the helpful honest service rendered to it by its superior; it rebels against a condition of affairs where the superior race regards its superiority as a license to cruel exploitation and to foolish assumptions which humiliates the natural human dignity which all men share in common. History is largely a series of big blunders (although in writing it is made to appear something quite different) and the biggest blunder of all, in the contact of the races, has been a false reading of the obligations of superiority. For superiority is an obligation, and nothing but an obligation. "For unto whom much is given, of him shall much be required." That is the law. The superior servant of mankind does not have to prove his superiority; it is gratefully acknowledged. All the world needs help, and the helpers have their crown unchallenged.

Here also is the law of international relations. We have lately seen at Genoa the old, old game of the stronger trying to compel service from the weaker, the greater from the lesser. More ruthless than the ruin wrought by invading armies, more devastating than all the material destruction brought by war, has been the vainglorious overriding of the rights of the smaller nations by the mighty; not by force of arms, but by force of gold, that most conscienceless weapon of all, to wield which is a coward's joy. If the United States is keeping herself out of the European welter because she sees that no self-respecting nation can even be a witness of the international financiers' game, then we have done well. There was once a time when the proud boast of our own nation was that we were a friend of the little nations, when our glory was that we were helping struggling nationalities less fortunate than ourselves. We don't hear that boast so much nowadays, because we are not extending the help we once so freely gave. Our own small taste of imperialism brought us perilously near the tactic of the oppressors of the old land. Not, to be sure, because our people have grown hardened, but because now even our American affairs are no longer responsive to the American conscience, but to the policies of the international financiers who have no country and who profit from the distresses and exploitation of the people of all countries. There is no need to defend by force of arms the superiority of a nation that serves its neighbors. Its protective and progressive leadership is readily and gratefully acknowledged by all its beneficiaries.

This is also the law of class distinction. There will always be classes, based not on the constantly changing accident of the possession of goods, but upon the differing mental and moral caliber of men. Our classes do not run down family lines; classes are erected upon natural gifts which are highly employed only in the service of the others. The world is a scene of jealousies and hatreds simply because the so-called "fortunate classes" have regarded their good fortune as being solely for their own enjoyment, and have not regarded it as being an obligation laid upon them to strive to bring all families up to their own standard of security and opportunity. Had the Russian nobility and the Prussian aristocracy served as they could have served, they had not been destroyed—and American classes may well ponder the judgment that overtook these victims of their own selfishness and of others' hate.

This is also the law of individuals. If a man is given the gift of music or of management, if he has mastered the art of healing or of leadership, it is not his, and his possession of it is not acknowledged, until he shares it widely. The individual who conceives his special gift to be his own, to be used for his own advantage, is committing the supreme sin against the dispensation of destiny by which he has his gift. And the law of retribution shall not be long in overtaking him. In the arts and crafts, in manual toil and in management, the law of unchallenged possession and honor is based on service and on nothing else.

Some of our professions—at least two of them, medicine and the law—are under question now as never before. Why? Surely not because the Law has rendered the service of wisely directing men in their relations; surely not because Medicine with a skilled hand has brought healing to the world; not because of service at all; but because, upon the attainment of a certain degree of success came a thirst for overlordship, came an emphasis on "our rights" instead of "our duties"; came organization to "place the profession on a proper footing," which appeared to the people very much like an attempt to switch the relationship, making the people the servants of the professions. This and this only is responsible for the mist of distrust which is rising. It is only right to say again that this change of professional attitude is not American: our professions also are being poisoned, as our finances are, by alien ideas which regard Service as an idealism of old women. We ought to get back to the principles which made these professions great in unchallenged greatness—the principles by which they rendered Service, and first of all Service.

Gifts are not given to the individual who happens to exercise them. They are given through him to the community in which he is placed. That is, the gifts are not his; *he himself is the gift given to the people.* He does not *have* it, he *is* it. Nothing was given to Lincoln for Lincoln's use; Lincoln himself was given to the people, an embodied gift to the nation. The only way the God of the People can give gifts to the people is to wrap them up in men, and give the men to the people. It is this fact which makes it so terrible a thing to see gifts used to oppress, or to minister to the selfishness of the bearers of them.

Service is the law of life, the practical law of practical life, and there is no field of activity where this is an exception.

THE gifted man bears his gifts into the world, not for his own benefit, but for the people among whom he is placed; for the gifts are not his, he himself is a gift to the community. That is the way Life gives gifts to the people; it wraps them up in men, and sends them forth. If then the bearer purloins the gifts for his own use, and turns his ability to serve into an excuse for overlordship and exploitation of those who need him, he is a traitor to the Universe. Every kind of ability or superiority is an obligation. Here is the solution of all racial, national, class and individual problems. Service is the badge of the great. There is no greatness without it.

A volume of 346 pages, durably bound, containing 98 of these articles under the title of "Ford Ideals," will be sent postpaid for $1.00.

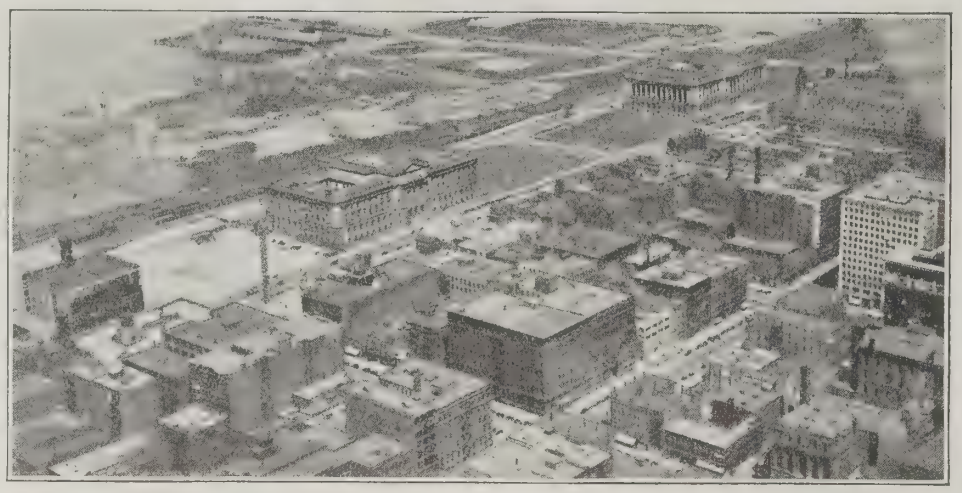
Why Is the Cleveland Union Station in a Hole?

Scheme to Place Terminal on Mall Ratified But Not Carried Out

By FRANK HILL

VISITORS to Cleveland generally wonder why that metropolis should offer such miserable depot accommodations for the traveling public. The Union Station serves three of the principal railroads—the New York Central, the Big Four and the Pennsylvania. More than 50 trains take on or discharge passengers at this station each 24 hours. It is a terminal point where many travelers must change cars for the East, West and South.

And yet for more than 50 years this station has been a wooden affair, literally set down in a hole at the base of a ridge running along the south shore of Lake Erie. The tracks are cramped into a narrow strip between the ridge and the water front.



Approaching this station in a street car or an automobile from the city, the first impression one gets is that the Union Station is nothing but a big sprawling train shed down in a gully. And that impression is about right. To get into the depot after leaving the street car, the traveler is obliged to walk down a covered incline or runway, provided with long wide steps which seem to have been constructed solely to wear the foot passengers out as quickly as possible. Then a street must be crossed before the bridge leading to the depot building can be reached. The street is on a side hill, it is paved with rough cobblestones, and often obstructed with taxicabs and automobiles. In rainy weather it is quite an adventure to get over without slipping down or being hit by a vehicle rushing up or down the sloping street, or backing around before the entrance. The bridge leading to the depot is on an incline, from which the wide steps have been mercifully omitted.

There are two main floors to the passenger station proper—one on the ground for baggage and a restaurant, and a second floor for ticket offices, waiting rooms, rest rooms, the usual magazine and candy concessions and telephone booths.

Trains are reached by walking along a covered extension of the second floor which reaches out over the tracks in the direction of the lake. Stairs lead down from this platform to the various trains which stand on tracks under train sheds.

The general impression created by this passenger station is that it is a very cheap affair, utterly unworthy of the railroads or the city. It is ugly, inconvenient and dangerous. Being made entirely of wood which has become highly seasoned, it is a veritable fire trap. Once started in that inflammable structure, fire would quickly spread and destroy life and valuables before the fire fighters could possibly get into action. It is too small to care properly for crowds that visit the city on great occasions. During the war it was constantly jammed with masses of soldiers and their loved ones, the mass of humanity often being so dense that travelers had to fight their way through, to and from the trains.

The Nickel Plate, Baltimore & Ohio, Erie, and the Wheeling & Lake Erie roads have separate terminal stations in other parts of the city. None of them is very creditable. They are small, out of date in their architecture, and are plainly a hang-over from the big-town period in the growth of Cleveland.

If the station went on the Mall, it would take the vacant ground shown here.

In contrast with their terminal stations several roads have creditable up-town depots. For example, the Pennsylvania depot at Euclid avenue and Fifty-fifth street is a modern structure of brick, concrete and steel; light, airy, and equipped with every convenience including telephone train annunciators. The New York Central Station, at East 105th street, is also a credit to the city and the railroad. When a distinguished visitor is coming to Cleveland, the reception committee generally plans to meet him either at the East 105th Street Station on the New York Central or the Fifty-fifth Street Station on the Pennsylvania line. Thus they avoid the gloomy wooden shed known as the Union Station. Mention should also be made of the Nickel Plate Station at Euclid avenue and East 123rd street. This is modern and superior in structure and design to the Nickel Plate Station, which, like the Union Station, is "down in a hole," but in the southern part of the city.

Ever since Cleveland got out of the "big town" class and began to feel the growing pains of a metropolis, there has been intermittent talk about the need of a "great union passenger station." The idea, of course, was to bring all the trains into one terminal, where passengers could conveniently change to other roads, the interurban cars, or to the street cars.

After 25 years of talk nothing has been done. The Union Station is still in a hole, and Cleveland has become a hissing and byword among the cities of the nation because of her ugly old Union Station. Thousands of persons are asking:

"Why the delay?"

"Who is blocking the game?"

"Is it due to rake-off among the politicians?"

"Can't the railroad officials agree on how the details should be worked out?"

Apparently, the delay was caused by the inability of the city officials and the railway authorities to get together about locations, land titles, and so on. Finally, the negotiations took form in an ordinance approved by a referendum vote in November, 1915, of 51,400 for, and 17,000 against, providing for the erection of a union passenger depot on the lake front at what is called the Mall site, to the east but not far from the present station. This arrangement was accepted by the New York Central, the Big Four and the Pennsylvania lines. Everybody felt that the right thing had been done, and that in the course of time a union station would rise commandingly at the gateway to the city.

The Mall is the pride of Cleveland. It originated with Mayor Tom Johnson. It consists of a strip of land running from the public square to the lake in which all public buildings are to be located. Already a part of this immense plan has been carried out by the erection of the post office, the courthouse, the city hall, and the municipal auditorium. Work is now under way on the new public library building which is part of the Mall group. Outstanding features of this plan are uniformity of architecture in the buildings, and the effect of having so many fine structures massed together.

The city hall and the courthouse are located on the elevation overlooking the lake front, about half a mile apart and are very imposing. A union passenger station, something like the Baltimore & Ohio in Washington, D. C., set midway between the city hall and the courthouse, would fill the eye and complete the picture, and thus the Union Station would be out of a hole at last. But not yet. Shortly before this country got into the Great War the railroads notified the city that they were not in a position to begin construction.

Meanwhile, O. P. and M. J. Van Sweringen, who had developed a suburban residential district on Shaker Heights, were active in promoting a rapid transit line for the benefit of home builders to whom they had sold property. A part of their plan was the construction of an electric road giving a 20-minute service between the Heights and the public square. They also acquired control of the Nickel Plate. In working out their purpose they developed a plan to build a stub-end passen-

Witt: Cleveland's Champion

PETE WITT, traction expert, is one of the outstanding "institutions" of Cleveland. He has been a storm center in that city for many years, and promises to live up to his reputation for many years to come. He is an iconoclast who has no respect for sacred images of any sort, and he is never happier than when he is smashing something that affects the welfare of the people. Enemies dread his scathing tongue, and his ever-ready arsenal of facts which he knows how to use with deadly effect. Among the pet names by which he is designated are: "Soap-box orator," "paradox," "dreamer," "bulldog," "anarchist," "socialist," "single taxer," "free trader," "idealist," "jawsmith," "packing house rough neck," and so on.

He is often characterized as "vitriolic," "genial," "courteous," "coarse," "lowbrow," and so on, according to the viewpoint of the speaker. His opponents sometimes employ terms that it would not be nice to use in this article. Packing house rules are Witt's choice of weapons, and when he raises his raucous voice in a call to combat, there is a general movement in the direction of the storm cellars. Bitter as gall is this man in attacking public wrongs, utterly without fear, and a hater of precedent and tradition. His humor is acid and his satire savage. Few men have such a collection of dum dum bullets available in the form of up-to-date information with which to shoot holes in the operations of big business. There is a biting quality to his speech in attack or criticism, that generally gets under the hide. For example, in referring to golf he made the comment:

"Golf is a game that needlessly prolongs the lives of our most useless citizens."

Of course, it is a play on words, but it carries a sting that goes home. His favorite name for the Chamber of Commerce is the "Plunderbund." Referring to this organization, he said:

PETER WITT

"Whenever I am in doubt as to where I should stand on a public question, I wait until the Chamber of Commerce has acted. Then I take just the opposite position, for I know it will be the right one."

Naturally, Pete is about as welcome at a secret session of the Chamber of Commerce inner circle as a colony of wasps would be at a wedding party.

And yet there are persons in Cleveland who are dead sure that Pete Witt is a pretty decent sort of fellow. They make up the enthusiastic throngs who pack the Opera House and the Hippodrome when he announces that he is going to take off somebody's hide and hang it on the wall. It is this popularity with the people that makes Pete Witt invincible.

Witt is a compact, rugged man of 52. He is five feet, nine and one-half inches tall, and weighs 155 pounds. His coal black hair has scarcely been touched by the frosts of age. There is a merry twinkle in his mild brown eyes even when he is lambasting somebody. He generally wears a dark suit and a black, brown or blue bow tie. He walks a great deal to keep himself in condition. He owns a collection of pipes from clay to meerschaum, and greatly enjoys smoking them turn about. Once and only once he tried to smoke cigarets. He took a package home and used all of them up in one evening. That finished him as a cigaret smoker.

Politically, he is a single taxer, and religiously, he classes himself as a "heathen." He enjoys the poems of Bobby Burns in his moments of relaxation, but his regular campaign diet is "Progress and Poverty."

While Witt has always been an oratorical and political fighter, he fights for principles, and does not assail individuals, except as they embody the evils he is attacking—or get in his way. What he does is for social purposes—for the good of all the people. He is the champion of certain ideas and ideals which in his mind rise far above personalities. Like all such prophets he is much maligned and misunderstood. But that does not worry him in the least. He regards such an attitude as a necessary part of the game.

Witt has been city clerk, city street railway commissioner, and once he ran for the office of mayor, his opponent being Harry L. Davis, now governor of Ohio. Last autumn Witt headed the campaign committee of 100 organized to promote the city manager plan for Cleveland. The plan carried by a large majority, and on January 1, 1923, it will become effective. Witt has been accused of an ambition to be the first city manager, but he declares that he does not want any political office. However, he will be active in setting up the machinery for the selection of a high-grade city manager. Incidentally, just now Witt is leading a fight in opposition to the erection of a union passenger station on the public square. He has put in a lot of time and expended $600 of his own money in personal expenses, all to defeat a project that he considers injurious to public interests. Pete wants the depot on the lake front at the end of the Mall, or group of public buildings.

Early influences had much to do with making Witt what he is today. Perhaps if he been differently placed at the outset he might now be at the head of a corporation that would be engaged in doing some of the very things that he is fighting. He is a man of large

25 Years of Talk and Plans Are Still Held Up

Real Estate Holdings and Transfers Involved in Complicated Deal

ger station on the public square for all the interurban lines entering the city, and for three steam lines—the Nickel Plate, the Wheeling & Lake Erie and the Erie. With this in mind they organized the Terminals Company.

Then on the suggestion of the United States Railroad Administration, the Van Sweringens evolved a plan to erect a union passenger station on the southwest corner of the square, and handle the trains on underground tracks after the manner of New York. All railroads entering Cleveland together with the interurbans were to use this terminal. An ordinance providing for the erection of such a station, the opening of a new route, and for certain improved freight facilities, was submitted to the people in January, 1919, and approved by a vote of 30,758 for, to 19,916 against. A big factor in the campaign was the oft-reiterated promise that the depot construction would give employment to hundreds of returning soldiers.

Thus the proposed new union passenger station was picked up and moved from the Mall to the public square in one day.

In April, 1921, the New York Central applied to the Interstate Commerce Commission for authority to join with the Big Four and the Nickel Plate in an agreement with O. P. Van Sweringen to acquire the entire capital stock of the Terminals Company, at its par value of $10,000, 71 shares to go to the New York Central, for $7,100; 22 to the Big Four for $2,200; and seven to the Nickel Plate for $700. It also sought other agreements essential to the development of the project. A very important part of the deal was the proposal that the three railroads named be permitted to guarantee bonds to the value of $60,000,000 by the sale of which the Terminals Company expects to finance the union passenger undertaking. Furthermore, the agreement of the railroads to purchase all the capital stock of the Terminals Company contained the unusual provision that the railroads would deliver proxies to O. P. Van Sweringen authorizing him "until completion and tender of a portion of the union passenger terminal to the railroads as aforesaid, to vote the stock of the Cleveland Union Terminals Company at any general or special meeting of the stockholders of said company for the election of directors."

In short, the New York Central, the Big Four and the Nickel Plate railroads proposed that they be permitted to buy the stock of the Terminals Company, guarantee its bonds, and turn the voting power of the stock over to O. P. Van Sweringen, the chief promoter of the terminal station. However, there was a string to this proposition. The Terminals Company was required to consult with the three railroads in the matter of salaries and heavy or continuing expenditures. On the surface this looks as if O. P. Van Sweringen was to become merely the agent of the three roads in looking after the erection of the union passenger station. Where do the Van Sweringens get off in the deal, you ask? Wait a moment.

They had formed two other companies—the Cleveland Terminals Building Company, and the Cleveland Traction Terminals Company, the latter with a prospective capitalization of $25,000,000. The purpose of the building company was to erect a large and handsome office building over the Union Station, from which the Van Sweringens and their associates would derive a profit. In exchange for these "air rights," the Terminals Company would receive a perpetual easement in the lands required for the east approach to the station. It was claimed by the New York Central that the net cost of acquiring such an easement would be $2,954,438 and that the air rights were worth $2,209,741. In passing it may be remarked that full use is made of the air rights over the New York Central Terminal in New York City, but the revenue goes to the railroad.

This group of buildings will be torn down if the station is erected downtown.

On April 19, 20, 21 and 22, 1921, a hearing on the application of the New York Central and associated roads was conducted in Washington by W. A. Colston, director of finance. He advised that the application be allowed, and on his recommendation the matter was taken up for further consideration by the finance committee of the Interstate Commerce Commission, consisting of B. H. Meyer, J. B. Campbell, and J. B. Eastman. During the hearings C. C. McChord, chairman of the commission, and Commissioner J. J. Esch sat with the committee. Mr. Esch is the joint father with Senator Cummins of the Esch-Cummins Act for the governmental regulation of railroads. The roads were represented by distinguished attorneys, while William B. Wood, director of law, and Mayor W. S. Fitzgerald appeared in the interests of the city, which had approved the plan of the railroads. Peter Witt was there in his own behalf and at his own expense. He was the only representative of the public present.

He showed that while the proposed plan to erect the Union Station on the square would cost $60,565,818 it could be built on the original Mall site for $42,179,387, and would be equally serviceable. Notwithstanding the higher cost the New York Central favored the former plan. Mr. Witt further called attention to the congestion of street car and vehicular traffic that would result from the closing of 48 acres of streets in the heart of the city south and west of the public square, which would be necessary to give space for the union passenger station.

After the hearings in April, further consideration of the case went over until August 2, on which date the final oral arguments were heard. Newton D. Baker, as the representative of the railroads, spoke for two hours in favor of the station on the square, and Peter Witt occupied the same amount of time in opposition to the plan. He insisted that the Mall was the only proper and logical location for the Union Station.

On August 13, 1921, the commission rejected the application of the railroads for permission to acquire the stock of the Terminals Company and guarantee the bonds for the erection of the union passenger station.

In summing up the case the commissioners said, among other things:

"From what has already been stated, it appears that the project for which the people voted is not in all respects the project which is now under consideration. Morever, there is evidence of a sharp division in both public and expert opinion. Nor are we persuaded that the reservation of air rights in the hands of private interests is in accordance with sound public policy."

In dismissing the application the commission left the way open for a rehearing on the presentation of further evidence or a modification of the plans.

Steps were taken at once by the railroads and allied financial interests in Cleveland to reopen the case.

Accordingly, Commissioner J. B. Campbell went to Cleveland on September 22, 1921, to preside at the rehearing. When it appeared that the interested railroads had not produced further evidence or modified their plans, Peter Witt moved that the application be dismissed, but he was overruled. The hearing occupied seven days, in which the only new matter presented by the applicants was that the cost of building could be scaled about 20 per cent, as the previous figures had been based on war prices, which had dropped considerably since the estimates had been made up. Finally, Commissioner Campbell announced that the case was

(*Concluded on page 12*)

Defender of the Underdog

capacity, and intense feeling. To this must be added his uncanny insight into the sinister methods by which money and brains can be used to ride the poor for a profit.

Witt was born in Cleveland. As a boy of 13 he quit school and went to work in a basket factory. Later he became a molder, and worked in foundries for 10 years. His ready tongue and intellectual ability made him a leader, and when his associates wanted their wrongs presented Pete was always the spokesman. He gained such power that the Cleveland foundries blacklisted him, and he had to walk the streets in search of work. While thus out of a job he sold insurance, worked for newspapers, and wrote books on single tax. At this period in his career he suffered from what Tom Johnson later characterized as "the blacklist of the criminal rich and the distrust of the ignorant poor."

"What particular influences had most to do with shaping your life and purposes?" I asked.

"My feeling that workingmen were being ground down by employers, and a determination to make better conditions for men and women who toil," he responded. "I was a member of the Knights of Labor, and by many of the exclusive East End people I was looked upon as a menace to society. Three men came into my life whose influences still live with me. All of them are dead, but I shall cherish their memories as long as I live. They were Dr. L. B. Tuckerman, physician and surgeon, Tom G. Fitzsimons, and Tom L. Johnson. Dr. Tuckerman was also a member of the Knights of Labor. He was a single taxer, and devoted his spare time to a fight for political independence. He preached his doctrines from a soap box on the public square. I learned much from him, both as to ideas of government, and the way to get those ideas over to the public. Early in my career I discovered how to get up before a crowd on the square and obtain a hearing. Dr. Tuckerman won the allegiance of men of the most diverse social and political views. When he died there were 16 men at his funeral service who could not possibly agree upon anything. They represented the Chamber of Commerce, Central Labor Union, the orthodox church, the Free Church society, preachers and agnostics, and so forth. Fitzsimons was also one of the early soap-box orators. He later became a builder of railways and made a fortune and died a wealthy man. Tom L. Johnson was a rich man who did his best to help the poor. He gave his fortune and his life for his cause, and I am proud that I had the opportunity to fight by his side all through the stormy years that he was mayor of Cleveland."

Pete Witt and Tom Johnson met in a very dramatic way. Johnson was running for mayor to drive through his ideas about three-cent car fare. One night in a tent meeting he was constantly heckled by a young man in the middle of the audience who persisted in asking very embarrassing questions.

Finally, Johnson paused and inquired:

"What is your name, may I ask?"

"Witt—Pete Witt," came the defiant reply.

"Oh, you are the young man I have been hearing so much about. Your questions are fair, and indicate intelligence, but you are at a disadvantage out there. You could be heard better from the platform, and as I believe in giving every man a fair chance, I invite you to come up here with me."

Taking the hide off 'em.

Instantly there was a howl in the audience. Some wanted Pete to keep his seat, and others wanted him to accept the invitation. Finally he went up, and he and Johnson had a lively time discussing the questions at issue. It was a clever thing to do. I wondered what effect it had on the young agitator. So I put the question to Witt:

"Did Johnson's courtesy tend to modify any of your opinions? Did he win your good will on that occasion to such a degree that you let up in your fight?"

"No, that did not change me a particle, but later I came to see that Johnson was different. It was several years afterward that we really got together."

Eventually, Witt became city clerk during the Johnson administration, and Newton D. Baker came into the family as city solicitor. While Witt was characterized as the "rough neck" of the administration who was always ready for a fight, Baker was classed as a "high brow," who used smooth words, and quotations from the classics in his addresses. In one respect Witt and Baker are alike—both have voices of wonderful endurance and carrying power. Their social ideals are similar, but their methods are utterly different. Baker is now president of the Cleveland Chamber of Commerce and an attorney for railways, while Witt is still just—Pete Witt.

Johnson's first act after his election as mayor was to create a "tax school" and put Pete Witt in charge of it. The purpose of this school was to equalize the appraisal of property for taxation. Witt found that the rate varied from two per cent of the real value of property to 68 per cent above. He established a system of valuations that is still in use. While he was

Canada's Problem With the New Immigration

Both Asiatic and European Undesirables Seek Entrance to Dominion

By A. R. PINCI

IF THIS country faces a serious immigration problem now and in the future, Canada's actual and prospective immigration problem is critical. In some ways it parallels American difficulties, but, fundamentally, because our northern neighbor is so industrially advanced in relation to population, it exceeds them.

Travel throughout Canada and close contact with her people will convince any one that the possibilities of that unlimited and virgin and mainly unexplored territory are beyond man to imagine. Every school pupil in the United States has read something about Hudson Bay and the Hudson's Bay Company, but few on this side of the border realize that it is figuratively possible to go from Chicago to the North Pole in a straight line over Canadian territory and Canadian waters.

Canada is larger in area than the United States, including Alaska, by 112,000 square miles, the approximate area of the Philippine Islands. Preliminary census data released by the Dominion Census Bureau, April 1, 1922, shows that the population is 8,769,489. The Canadian citizen is the world's richest man, on the basis of individual average bank deposits, and for his benefit the largest proportion of railway mileage to population is being operated. The national wealth is estimated at $2,100 per capita, with national development still in its infancy.

Canada Has Double Problem, Too

THIS will sooner or later be understood by the emigrating classes of Europe and the Far East, and it goes without saying that when the habit starts of emigrating to Canada, Canada's influx will be heavy. The Dominion Government long since found it imperative to restrict the process of indiscriminate welcome to all aliens, and it is well to bear in mind that Canada has had its quota of adventurers, as distinguished from adventurous beings, of wars, and of internal strife. Having, therefore, successfully overcome the sociological ills that accompany the formation of an undying nation, she is now between the devil and the deep sea.

The restrictive process is retarding the growth of population and because of this the intensification of what has been so far a man-made miracle is slowing up. In this regard there is a difference of opinion—and an honest one—between the governing officials and the great leaders of local thought, with the odds at this time in favor of the latter. And this concerns the United States for many reasons.

Canada is, of course, agriculturally successful. There are more than 700,000 farms, each averaging in value about $10,000. As an example of prospects, more than 12,000 farm settlers from the United States settled in Western Canada last year. Last fiscal year nearly 50,000 emigrants from the United States entered the Dominion and about one-third of these declared their intention of going on the land. This year (March, 1921 to April, 1922) emigration from the United States dropped to 29,345.

Agriculture being carried on after the most modern process and the land itself being of maximum fertility, it is evident that Canada, like the United States, is about to approach—if she has not already approached—the highest degree of marketable agricultural production. The next step is reducing the cost of producing it.

It is clear, therefore, that immigration that is to be allocated or deflected to the country must be in reasonable proportion to a corresponding degree of consumption. The question, therefore, resolves itself to this:

How many industrial or semi-industrial workers can Canada assimilate safely?

Behind that question there is another:

How shall they be classified and selected?

Canada has its Asiatic immigration problem, its European immigration problem, its unemployment problem.

Orientals Try to Get In

OFFICIAL Canadian reports state that determined efforts are being made by orientals to secure admission, "practically every method being tried in turn." Particular attention is drawn to the extremely heavy increase in the Chinese work recently, which has been due to the influx of alleged merchants, and the determined efforts made to evade the Labor Exclusion Order made it necessary to prohibit the entry of labor, an order in council being issued accordingly.

Oriental immigration, however, while of some importance to the authorities in the West, does not seem to assume the importance of the corresponding eastern problem—that of a preponderantly European immigration. I have heard it complained about from Quebec to Windsor, the latter a vital point, being just across the river from Detroit. Everybody, official and layman, seems to perceive some kind of premeditated campaign to facilitate the migration of these *unassimilable* classes.

Their objective seems to be that rather rich territory that borders along the United States—Quebec and Southern Ontario, although that is not necessarily their destination.

The main cause of alarm is the fact that this type of immigration does not represent the stock so essential to Canada at this time. They are frail of physique and congenitally incapable to meet the forces of nature in any productive or constructive pursuit. They belong, in the main, to the consuming classes, and just now this category is overburdened.

Said one of the most prominent Canadians in private life to me:

"You have visited some and will visit other large Canadian cities. Look about you, and except for certain local external signs they will look like any cities of the same type of the United States. Not a few are American stores. You will find American goods everywhere, and no matter what the particular brand or quality of the article you have been accustomed to, you are sure to find it here.

"But after you have looked at the cities, and especially as you traverse country that has never felt the pressure of man's foot, and miles are reeled off by the scores and the hundreds, you can easily figure out the type of inhabitant we are most in need of.

"We don't want an all-rural population any more than we want a predominantly urban population. We wish to maintain the normal average, whatever that may be. It is not possible to reduce it to actual figures and to attempt to bring it about by law.

"What Canada wants now is the type of inhabitant that finds its own level, but mark the word, its natural level. Just now this type is in the minority. The fellow that we want most may want to come, but while in a few cases he is unwilling to move just now, in most cases he is kept at home by our present law.

"The literacy test is regrettably inadequate, unequal, unscientific and unjust. Our minister of immigration and colonization has authority under the law to exempt at his discretion persons or classes of persons from the literacy test, but we want something less circuitous.

"We have no place just now for the man who knows how to read 'not less than thirty' words and is not much better at anything else. If the immigrant happens to know 13 words only, it is necessary to ask the minister to issue permit A, if otherwise desirable.

"In other words, our idea of the test of fitness is not literary at all. *It is moral and occupational.* The man who meets those two primitive qualifications is the man for us. And he is the man for you, too."

Statistically, the picture is not alarming. The latest table indicates that for every clerk and trader there were two laborers, three mechanics and four farmers admitted. There is a growing suspicion, however, that under the general classification of either farm or general laborers, or the more elastic one known as "not classified," there are admitted aliens who claim an avocation for their occupation.

"Flash Rolls" Aid Incomers

THIS claim is all the more feasible when the immigrant has the requisite funds, that is to say, 250 Canadian dollars, plus 125 dollars for every member of the family over 18 years of age and 50 dollars for every child over five years of age. Yet these money requirements served as a new field of operations for sharpers who are ever on the lookout for quick profits, the "bankers" who lend "flash rolls" for a consideration. This evil, by the way, has been discovered at immigration stations of the United States as well, resulting, if it has not already done so, in regulations that will prevent incoming immigrants from coming within reach of any outsider until *after* they have been cleared by the authorities.

Meanwhile, the Canadian authorities have recognized the unilateral efficacy of the strict application of the money requirements of an immigrant. A recent order in council provides that this particular regulation may be left entirely to the discretion of the inspector, who in turn must be satisfied that the applicant for admission within the Dominion is capable of earning his living in the occupation he claims, and this, of course, implies that there exists a fair opportunity to find such employment in the place where he intends to reside.

It is evident, thus far, that the Canadian authorities are awake to the necessity of making elastic legal provisions in a movement of population that cannot always be safely or satisfactorily governed by means of fixed rules. The literacy test is the one that is still most difficult to surmount.

In considering Canada, not only as to her immigration, but as to her other vast interests, so closely bound to the identical aims in the United States, it is possible to refer only to the most representative facts. It is out of the question to indulge in details, illustrations, comparisons.

To be precise, so far as North America is concerned, immigration is not a separate question to either the United States or Canada. On the contrary, it is interrelated, concomitant, homologous. Their immigration policies and laws being almost alike now, they should be, so far as the new crop of emigrants is concerned, both reciprocal and fool-proof.

There is no reason why, if this desirable arrangement can be formulated, the Canadian-American boundary may not be obliterated, and permit the free movement of peoples from one nation to the other. Mexico does not figure seriously in our immigration troubles today, but in every probability will in the future, and it is much more important for the Canadian and American governments to keep close watch over the outer or sea gates than along the international border.

Canada, however, has found a quick and safe way to attain her aims by co-operation. For too long a time, especially in the United States, there has been a miasmatic suspicion that transportation companies are organized to beat the law, if necessary, in order "to boost traffic." Whenever the number of deportations from our ports increased there has been a voice, usually in Washington, that has charged this or that transportation company with a desire to force immigration.

No American railroad or steamship company, with the exception of the United States Shipping Board, which is governmental, has been given credit for common sense and considered as worthy of co-operating with the Congress in helping out in immigration matters. The net result has been that these companies have found it futile to become interested in producing desirable immigrants.

Canada, on the other hand, pursues no such policy. What there is to Canada depends, after all, upon the railroads, and an industry that means 40,000 miles of track and more than $2,000,000,000 of capital is entitled to respect. Let's see what this respect means, in hard facts.

Recently, there arrived on board the "Montcalm" a group of 15 families, aggregating one hundred and seven persons, personally conducted by a representative of the London staff of the department of colonization and development of the Canadian Pacific System. This group constituted the largest party of landseekers ever brought out, but what is more important is that the average wealth per family in the party—and they were all from the British kingdom—was in excess of $10,000, to be invested in farming enterprises in Western Canada.

Only One of Many Such

THIS party is only one of many that constantly arrive at Canadian ports, and although the financial importance of this group of immigrants exceeds the average, it goes to prove what can be done by personal contact and careful solicitation on the part of experts. Now, in dollars and cents, it is probable that the outlay gathering together such a party far exceeded the net gain to the company for carrying them and safely seeing them settled at their destination.

Last year the same company was instrumental in bringing over five personally conducted parties, which means that the British Isles gave Canada 228 new families of 460 persons and a wealth of more than $600,000.

One of this company's steamers arrived at Quebec late in May with 665 third-class passengers, mostly Italians. They were all of the farmer class and all physically fit. A few had plenty of money while others had just enough for immediate requirements. Sixty per cent could speak French and not a few could speak English. With the exception of previous residents of Canada most of these young married couples or single men and women were practically given the "once over" by the company's representatives. They did not act for the government, of course, even though they were obliged to consider the law, but the greater benefit lay in the opportunity to meet the emigrant in the native country, under normal conditions, when the best and most dependable tests can be undertaken.

The provincial government of Quebec is about to offer practical aid to colonists by making it possible for the new arrival to start both producing and housekeeping at once.

"Hon. J. E. Perrault, minister of colonization, mines and fisheries," said Edmond Robert, the newly appointed colonization agent at Montreal, "has informed me that if possible he will establish a system whereby the government will clear at its own expense fifteen acres of land on each colonization lot, and will also build a house and little barn thereon so that the colonist on arrival will be able immediately to commence farming on part of his lot, have a home for himself and family, and a barn for his animals."

Meanwhile, activities are carried on in other ways. Every Saturday afternoon there will be a lecture on colonization given at the government office on St. Antoine street. The first gathering of the series, which began early last May, was attended by 40 prospective colonists, 14 of whom at once indicated their intention to take up farming.

Dominion and U. S. Co-operate

"OUR work in this regard will be mainly among the sons of farmers who have come into the city during the last few years," explained Mr. Robert. "They still retain their knowledge of farming and their love for the soil, and are the best possible material for colonists in the newer sections of the province. Present conditions are favorable for propaganda work of this kind, for the unemployment conditions have convinced many of them of the advantage of establishing themselves on the land and becoming their own masters."

As already hinted, as soon as Europe's migratory population begins to get what may be termed "the Canadian habit," mainly upon learning of these wonderful opportunities, the pressure upon the United States will be relieved somewhat, at least numerically, but the United States will not be relieved of difficulties.

It is very true that the Canadian and American immigration authorities co-operate with marvelous smoothness either at the boundary or at Canadian ports, but it is equally true that in general their work is a useless or, at least, a preventable duplication.

With politics playing such an emphatic rôle at Washington it is hardly probable that Congress will take up immigration problems in the near future and attempt to solve upon scientific and modern lines in conjunction with transportation and industrial requirements, by following wherever possible the Canadian idea.

Next week The Dearborn Independent will publish a close-up view of this problem by a Canadian journalist.

Animal Myths Abound in "Unknown America"

Tales of the Negro Cabin Once Told by the Indian Priests of Tradition

By HARRY E. BARNET

Ambitious buildings remain in the larger phantom cities.

IN THE wild uplands of Eastern Kentucky and Tennessee, the Western Carolinas and Virginias in Unknown America, there linger the weird traditions which were told in the days before the white man saw the continent.

The Indians, who once listened in ghostly fear to the camp fire tales in which their priests of tradition told the stories of the beginnings of the earth, and of life, have gone. But in the sentimental minds of the Negroes, and even among the white inhabitants whose forefathers have been mountaineers for scores of years, the fantastic tales are still whispered.

Among these tales were some that accounted for various animal traits. As Indian tales, however, these stories never got into general circulation beyond the mountains of the South. But it is said that they form the basis of the Negro stories of the "Uncle Remus" type. This claim arises from the enslavement of coast Indians before the Revolutionary War. The Indians were worked alongside the Negroes in the lowlands. Stray mountain Indians who wandered into the coast country were enslaved. They repeated the animal stories prevalent in the mountains to the Negroes, who handed them down. In the course of time, these Indian stories became known as Negro stories.

The rabbit is the central figure in most of the stories told by the Indian priests, perhaps because the rabbit is the commonest of all game. The rabbit is prominent in the animal stories of all primitive peoples. Everybody knows that the rabbit has only a tuft of hair where his tail should be. But it's dollars to doughnuts that in our day no hunter has figured out what became of that part of the rabbit's tail that he doesn't now carry along behind him.

These priests in Unknown America, however, settled that question long before there was a white man in this country. Their explanation began with the statement that the animals were of different sizes, and wore coats of various colors and patterns. Some wore long fur and others short fur. Some had rings on their tails, and some had no tails at all. Some had coats of brown, others of black and yellow. They were always disputing about their good looks, and they finally agreed to hold a council to decide who had the finest coat.

The animals heard a great deal about the otter, who lived far up the creek. It was said that he had the finest coat of all, but no one knew just what it was like, because it had been a long time since any one had seen him. No one even knew exactly where the otter lived; they only knew the general direction. But the animals knew he would come to the council when the word got out.

The rabbit, who wanted the verdict for himself, schemed to disqualify the otter. By a few sly questions he learned the trail the otter would take. On the trail he met the otter, and saw his coat of soft dark-brown fur.

The otter was glad to see the rabbit, and asked where he was going.

"Oh," said the rabbit, "the animals sent me to bring you to the council. They were afraid you might not know the road."

The pair traveled along. That night the rabbit selected the camping ground, because the otter was a stranger. He cut down bushes for beds, and fixed everything. Next morning they started on. In the afternoon the rabbit picked up wood and bark as they passed along. When the otter asked him what this was for the rabbit replied that it was that they might be comfortable that night. At sunset they made their camp near a river. When supper was finished the rabbit got a stick, and shaved it down to a paddle.

"I have good dreams when I sleep with a paddle under my head," explained the rabbit.

When the paddle was finished the rabbit cut away the bushes to make a clean trail down to the river. The otter asked why.

"This is the 'Place Where It Rains Fire,'" replied the rabbit. "Sometimes it rains fire here, and the sky looks that way tonight. You go to sleep, and I'll watch. If the fire does come, as soon as you hear me shout, you run and jump into the river. Better hang your coat over there so it won't get burned."

The otter did as he was told. The rabbit kept awake. After a while the fire burned down to red coals. The rabbit called to the otter, but he was fast asleep and made no answer. In a little while the rabbit called again. Then the rabbit filled the paddle with hot coals, and threw them into the air.

"It's raining fire!" he cried. "It's raining fire!"

The hot coals fell all around the otter, and he jumped up.

"To the water!" cried the rabbit. "To the water!"

The otter ran and jumped into the river. He has lived in the water ever since.

The rabbit took the otter's coat and put it on, leaving his own coat in its place. Then he went on to the council. All of the animals were there, every one looking out for the otter.

"The otter is coming!" they said at last.

One of the smaller animals was sent to show him to the best seat. They were all glad to see him, and went up in turn to say something to him. He kept his head down, with one paw over his face. They wondered that he was so bashful, until the bear came up and pulled the paw away, when lo! there was the rabbit. He tried to escape but the bear struck at him, and pulled off his long tail. The rabbit got away. Since then, however, he has had only a tuft of fur where his tail should be.

In those days the opossum had a long bushy tail, and was so proud of it that he combed it every morning, and sang about it at the dances. The rabbit was envious and resolved to get even. Two days before a great council and dance at which all of the animals were expected to be present, the rabbit stopped at the opossum's place to ask him if he intended to be there.

"I will come if I can have a special seat," replied the opossum, "because I have such a handsome tail that I ought to sit where everybody can see me."

"I agree with you," said the rabbit, and he promised to attend to the matter. At the same time he offered to send somebody to comb and dress the opossum's tail for the dance. This pleased the opossum. The rabbit went to the cricket, and told him to go next morning and dress the opossum's tail for the dance. He told the cricket just what to do, and went on about his business.

Next morning the cricket went to the opossum's house. The opossum stretched himself out, and shut his eyes, while the cricket combed his tail, and wrapped a red string about it to keep it smooth until night. But all this time as he wound the string he was clipping off the hair close to the roots.

That night the opossum went to the community house where the dance was to be held, and found the best seat was ready for him, just as the rabbit promised. When his turn came in the dance he loosened the string from his tail, and stepped into the middle of the floor. The drummers began to drum.

"See my beautiful tail," the opossum began to sing.

The animals laughed so loudly that the opossum wondered what they meant. He looked down at his beautiful tail, and saw that there was not a hair left on it, but that it was as bare as the tail of a lizard. He was so astonished and ashamed that he could not say a word, but rolled over on the ground, and grinned, as the opossum does to this day when taken by surprise.

Shortly after this time the animals got into a discussion, and concluded to settle it by a contest. At that time the deer had no horns, but was a great runner, and the rabbit was a great jumper. The animals were all curious to know who could go farther in the same time, and they talked a great deal about it. At last they arranged to match. A large pair of antlers was the prize for the winner. The rabbit and the deer were to start together from one side of a thicket, go through it, turn, and come back. The one who came out first was to get the horns. On the day fixed the animals gathered. The antlers on the ground at the edge of the thicket marked the starting point.

"I don't know this part of the country," said the rabbit while the animals were admiring the antlers,

Near Big Stone Gap, Virginia.

The Talking Disease That Afflicts Congress

Forty Million Words a Year Is Vocal Output in the Two Houses

By GEORGE H. DACY

SUCH stirring orations as "Spartacus to the Gladiators" and "The Charge of the Light Brigade" must have had a most profound effect on the then embryonic Congressmen during their schoolboy days, for oratorical pyrotechnics of that type are constantly on tap on the floor of the House of Representatives and in the United States Senate. There are many varieties of speechmakers. Some are short-distance sprinting orators, others are marathon speechmakers while others are ponderous, bombastic talkers who demonstrate great power and prowess.

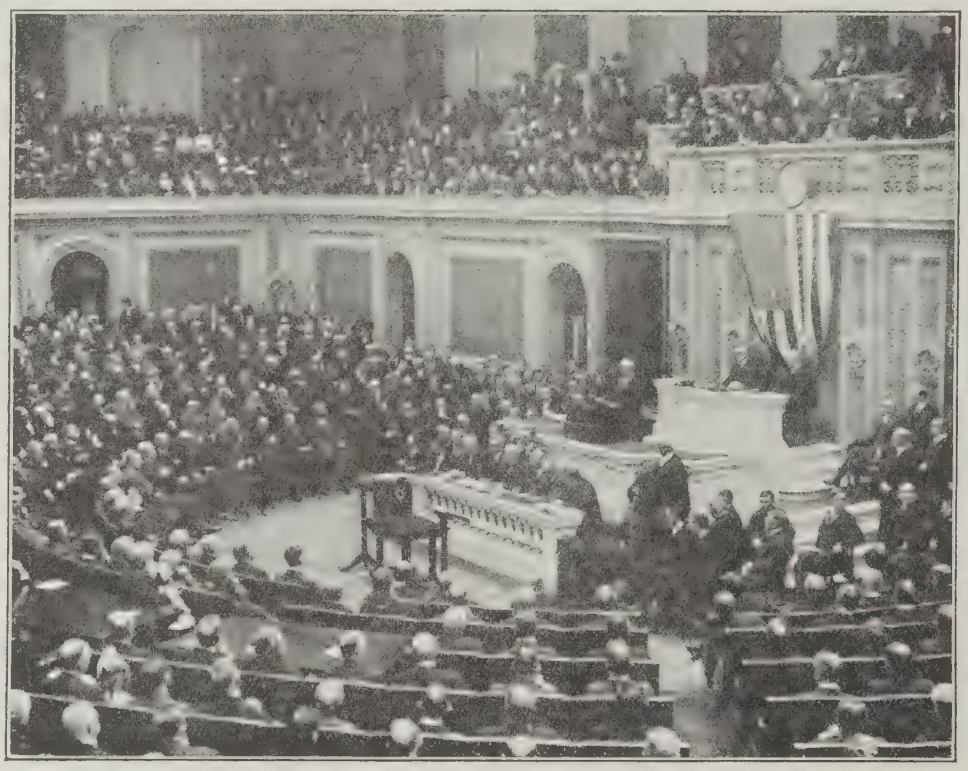
Anyone anywhere who classified the American people as a silent, reticent race should visit the august halls of Congress. The Congressmen annually use 40,000,000 words in the course of arguments, debates, discussions, controversies and the hundred and one other causes which may set off the speechmaking. Whether we send our best minds to Congress, we certainly send some of our most fertile and prolific vocabularies. The average layman who tries to decipher some of the speeches needs a dictionary, a literary reference library, several mythologies, a couple of histories of Rome and Greece and Egypt and an intensive college education.

Albeit, governing and lawmaking bodies, the world over, since the beginning of time, have been long on talk. Hence it is not surprising that our Senators and Representatives are ardent disciples of the talking habit. The astonishing thing is the transformation which occurs in some of the quiet and modest Congressmen who appear from the prairies of the Dakotas or the alluvial lowlands of Mississippi. To begin with, these newcomers are ideal auditors. They take it all in and say nothing. Finally, they feel called upon to rise and speak on some local measure. Perhaps it is with pounding hearts and shaking knees, they make their maiden speeches. But thereafter, they are lost. There is a thrill in standing up and talking to an audience. Once they have felt this thrill, the timidity, modesty and diffidence, which formerly held them silent, evaporate like fumes of gasoline. The talking habit, one of the most dangerous and incurable diseases, annually runs amuck among our Federal legislators. That is why it costs so much to keep Congress going.

One of the best informed men in Congress recently said that approximately 90 per cent of the speechmaking on the floor of the House of Representatives could be dispensed with. Just think of it, 90 out of every 100 words spoken in official capacity by our national Representatives consists of repetition, duplication or superfluous subject matter. In different language, Mr. Smith, of Georgia, Mr. Brown, of Texas, and Mr. Jones, of Indiana, say precisely the same things about the same bill. In many cases, 25 or 30 of the Representatives take a hand in an extended round-robin discussion and their arguments, boiled down, are nine-tenths duplication.

What Congress needs more than anything else is the best corps of expert surgeons to perform a major operation and remove the surplus conversation and discussion from this organization of legislators. There have been cases on record where leading Senators and Representatives have talked to empty rooms. Quorums have to be called very frequently because everybody gets fed up on too much talk. A Congressman may like to talk himself but he will not listen to his colleague.

The *Congressional Record*, which publishes verbatim the various speeches, ranges in size from about 10 to 200 pages—at present it is running about 64 pages an issue. The printers who handle the *Congressional Record* do not know how large each issue will be until the presses are busy turning out the finished copies. The work has to be done at night and the papers must be distributed by 6 a. m. to 32,700 subscribers. Everything may be quiet at the G. P. O. until about midnight and then a mass of material pours in unexpectedly, involving a complete change of plans relative to the size and make-up of the next issue. Sometimes, Congress sits until 1 or 2 a. m. and delays the printing. Preparedness for anything and everything in the way of printery abnormalities is practiced religiously at the G. P. O.



One night last summer, all the material did not reach the Government Printing Office until 2 a. m. and a printing record was established which will long stand in the annals of the modern newspaper world. The *Congressional Record* of 64 pages aggregating 136,192 words was set up, printed and delivered in four hours. It is doubtful if there is a metropolitan daily in the world which could duplicate this feat.

There are 96 Senators and 432 Representatives in Congress. These legislators are paid a total of $4,392,000 annually. In return, in addition to performing service in committee, they utter more than 40,000,000 words. The mathematician may figure that this official conversation of our lawmakers costs us more than 10 cents.

Representative Hampton P. Fuller, of South Carolina, a new member, summed up the situation admirably in his initial speech, April 28, 1921, when he said, "Mr. Speaker and Gentlemen, I have been trying very hard since being sworn in to keep out of debates and speechmaking. In fact, to do that is in line with the doctrine which rules my course. During the campaign last summer, I told my people down in South Carolina—that little but nonpareil state of the Union—that next to appropriations for the army and navy, the largest drain on the pockets of the taxpayers of the United States was because of the lost motion of Congress—speechmaking, the shooting of 'hot air,' the playing of politics, the Nero-like fiddling while Rome burns. And, gentlemen, I have found it so, since coming to Washington."

A war of words, a clash of vocabularies, an excited exchange of arguments are as commonplace as clock ticks in the dignified halls of Congress.

Congressman Blanton, of Texas, is a thorn in the side of the House of Representatives as he is a tireless talker and an obstinate objector. He preaches the doctrine of economy in the use of government funds, yet at the same time he is one of the foremost in demanding frequent roll calls in the House. Ordinarily, it takes from 20 to 30 minutes to call roll in the House of Representatives and where this process is repeated three or four times a day Uncle Sam loses about $3,000 to $4,500 worth of the time and service of his legislators.

President Harding addressing Congress

When it comes to a matter of marathon talking, Robert M. La Follette, of Wisconsin, can talk from the time the chickens go to roost until the cock crows the next morning without exerting himself unduly. Mr. La Follette will—and has done so—orate to the empty Senate with deliberation and at great length if the occasion demands. He talks slowly, smoothly, coherently and deliberately. His arguments are always systematic and logical. He uses to advantage his skill and experience as an able lawyer in summoning up the evidence and rounding off his conclusions.

Sometimes known as the "roaring lion of the Senate," W. E. Borah is a powerful and polished orator whose bite is as bad as his bark. None of his colleagues or adversaries like to get him excited as he veritably tears the hide off everything he tackles. He is an earnest, conscientious Senator and ordinarily he does not make speeches unless he has something important to say. Would that there were more like him among our national orators.

Senator James Reed, of Missouri, has one of the sharpest tongues and can say some of the most vitriolic things of any member of the United States Senate. He is a class A orator when it comes to a matter of rapid-fire wit and repartee. Still he does not waste time in useless speechmaking. He says his say at opportune times on matters about which he is informed and in which he is actively interested. If there were more "Jim" Reeds and fewer verbal gymnasts in the Senate, there would be no legitimate excuse for this article.

Senator King, of Utah, is another strong, consistent, tenacious talker who wields an awe-inspiring vocabulary and an irrefutable array of forceful arguments when the occasion demands. Unlike Senators La Follette, Reed and King, there are a number of Senate members who are rarely heard. Proportionally, however, there are a larger number of silent members in the House than in the Senate. Practically nobody can recall reading about speeches by Senator Elkins, of West Virginia or Senator Phipps, of Colorado. Yet when the final vote occurs, these reticent members are just as important in their aggregate influence.

Senator Smoot, of Utah, is probably the hardest working member of Congress. Invariably, he speaks intelligently and authoritatively on matters in which he is interested. He always deals in fact arguments with systematic piles of data and statistics close at hand to back up what he says. Senator Smoot usually talks to a purpose and seldom kills time.

Fifty per cent of the talking in the House of Representatives is done by a group of between 25 and 35 orators who talk whenever they get the chance.

Although surplus speechmaking appears extravagant to most of us, there is something to be said in its favor. If Congress worked rapidly and smoothly without any lost motion, many important measures which now hang fire for months might be passed or rejected just a few days after they were submitted on the congressional gridiron. As matters stand, the bills drag along week after week and month after month. The American press, represented by 800 Washington writers, carries information about the progress of each important bill. In the long run, the public benefits somewhat from the dilatory method of handling prospective legislation which now is followed. If Congress were emotional and easy to arouse and influence, some silver-tongued orators might be able to sway sentiment almost at will and effect the speedy passage of measures and laws by his personal power and magnetism.

A considerable portion of the most vehement and vindictive talkings of Congress occur in the special committee meetings instead of directly in the House or Senate. During and since the war, Congress has been in almost constant session.

Congress convenes daily, except Sunday, at noon, and adjourns at 5 p. m. During rush periods, however, the gatherings frequently last until 6 or 7 p. m. and occasionally until midnight or later. During the war, several all-night sessions were held.

The fact that Congress does not meet until midday does not mean that all the national assemblymen are late sleepers. Many are at their offices early every morning prepared for committee meetings. The members of the Senate are divided into 34 committees, chief of which are the Foreign Relations, Immigration, Appropriation, Indian Affairs, Banking and Currency, Agriculture and Forestry, Finance, Interstate Commerce, District of Columbia, Irrigation and Reclamation, Judiciary, Patents, Pensions, Mines and Mining. There are 60 regular committees and two select committees in the House headed by Elections, Ways and Means, Appropriations, Judiciary, Banking and Currency, Rivers and Harbors, Merchant Marine and Fisheries and the like.

The committee meetings on tariff questions usually occupy many months. Scores of witnesses are examined and these examination hearings when finally printed take up hundreds of pages of close-lined text. In the arguments before the committees, millions of tons of talk are wasted in repetition and duplication. Witness after witness tells practically the same story. Yet all this data has to be recorded and preserved in the government archives.

Any legislation in either the House or Senate runs a roundabout, crisscrossing, overlapping course before it finally reaches the President. To illustrate, the bill is first introduced into either the House or Senate. Let us take the case of a House bill and see what happens to it. It is referred to a committee in the House and hearings are held. It may take many months to complete these hearings. According to its importance, occasional or frequent speeches are made on the floor. Finally, the bill will be reported and be accorded a regular position on the calendar. Then the House discusses the bill in the committee of the whole. This may occupy several weeks. Thereupon, the bill is reported to the House. The House takes up the matter and unless there is a special agreement to limit debate, the proposition may be hashed and rehashed times innumerable. If the bill resists the many and varied onslaughts, it ultimately may pass and go to the Senate.

There the bill is handled as in the House. It is referred to a special Senate committee which holds hearings which cover practically the same material and involve the same witnesses as those examined in the House. After several weeks or months, the bill may be approved and reported back to the Senate. Then the Senate as a whole takes many whacks at the bill. If the bill is passed by the Senate in a slightly modified form to that accepted by the House, it is sent to the conference committee. If Congress ends before the conference committee agrees, the legislation is temporarily killed and the whole program must be repeated. In case the conferees agree, they report it back. If it is approved by both bodies, it ultimately goes to the President for his approval and signature.

Riding Hobbies Through the Race of Life

Inventors Just Men Whose "Crazy Ideas" Handicapped Their Vocations

By an Old Hobby Rider

WHEN horseless vehicles first came to town I lived on a street leading up out of the park. Through that summer, as theretofore, the family often sat out front and watched across the valley the changing glow of the pink and gold of the sunsets.

But every now and then our reverie would be broken by an old one-lunger trying to make the grade. You remember the kind, engine underneath, cranked from the seat, steered with a tiller, and you watched the road over a beautifully curved dash, a copy of a fashion plate toboggan sled. They were short on power, those old buses, but long on noise, and their negotiation of the grade was an ever-recurring mechanical tragedy. One always thought that this time they would surely make it, but they never quite did. Running in high gear at smart speed with delightful confidence at the foot of the hill, they would get slower and slower until at last, near the top, they would go into low with such a distressing final effort as would wring pity from a stone.

It has often seemed to me that many men are like that old "one-lunger." As long as they find easy going, one cylinder is enough, and they drift blissfully along with no ambition beyond the Saturday pay envelope. But when hard times come, and the force is cut, they find their one vocation is not enough to get them over the grade without distress. But if each had spent some of his leisure hours in recreational study, the loss of position need not embarrass him overmuch.

I know a machinist who lost his place last spring because of failure of the firm he worked for. This workman for several summers past had been growing flowers about his little place. In time he became very fond of them, and so took up the study of botany. When he lost his place, he began cultivating flowers in earnest, selling them where he used to give them away. He made more money this past summer with flowers than he did the previous summer at his machinist's trade.

Another workman, when his blue envelope day came, began selling bread his wife made, for she was a locally famed breadmaker. Their trade grew beyond their equipment, and a small baking machine was bought; and now they are about to install a second because the first is already overworked.

It would add to human blessings and individual independence if every man had both a vocation and an avocation. No matter how low or how high the niche he occupies in our industrial scheme, he should be able to do more than one thing well.

I am not forgetful that there are those who advocate specialization, and quote someone as saying, "If he build a mousetrap better than anyone else, a path will be worn to his hermit dwelling in the wood." But if we suppose all the mice to be caught, I think Mr. Hermit would subsist much better if he knew something about gardening as well as mousetrapping.

And I feel that I am entitled to speak with authority, for although I am engaged in the most hazardous of human occupations, that is, inventing, for a living (because it sounds so much nicer, I like to call it research work), nevertheless, in spite of this uncertain employment, my equipment is such that I look forward to the evening of life without timidity. If to make one's point it were permitted to cite personal history, I might venture to recount my own mental and manual endowment, although many another country boy has built up a wider range of knowledge—perhaps the man at my very elbow.

It was my good fortune, then, to have chosen farmer forebears, of sturdy Quaker stock, and so with a native inquisitiveness and a mechanical knowhow, it fell to my lot very early to keep in running order the varied machinery of the farm; to put coal oil on the mold board, of the plows when they were set away in the shed for the winter so that they would scour immediately when put into the ground the following spring; to fix the mower so that it would cut the heavy, the down and the tangled grass; to make the self-binder tie every sheaf of wheat, missing none; to stop a leak in the crown sheet of the boiler of the traction engine, and set the slide valve for lap and lead; to keep the windmill oiled to insure an ample supply of water for the stock; to adjust the trip-trigger on the harpoon fork that put the hay away in the big mow. I also learned to create, to build wagons and sleds; to set deadfalls for game and steel traps for fur. It was on the farm I learned the rudiments of weather cloud and goosebone lore; learned which was the north side of trees, the woodsman's natural compass; and that the Great Dipper would tell me the time.

And as learning is only adding to one's store of knowledge, is it any wonder that, later, when I left home to see the world, even while I was yet a lad, I found the activities of the great logging camps of Oregon and Washington were not so strangely different from our work of clearing the Indiana farm; that mining silver in the Southwest rather resembled well-digging back home; that the great mills were simply enlargements of machinery with which I was already acquainted, and that even new things were simply old familiar principles put together in a new way? I didn't have to lie awake nights to figure out the mechanics of "bronco-busting," or to practice very long before, riding range, I could rope and brand cows, and cook jerked meat on a hot stone.

When building bunk-houses, I found the work and carpenter tools just the same as when, only a little tyker, I built dog kennels with hammer and saw. The construction of an irrigation dam in the desert was quite unexciting, for hadn't I already builded mud dams and water wheels between the clay banks of old Deer Creek?

Even surveying and running levels, while requiring more accurate instruments, was very much like the fun we used to have sighting across the tops of two pins stuck in the ends of a shingle floating on a pan of water; nor was the installation of electrical machinery wholly strange to the boy who had strung a wire to a neighbor's house and set up a telegraph instrument at each end. Neither was I surprised when I found the locomotive like our old traction engine, the evening I enticed away the watchman at the railhead, so that I might borrow the locomotive and take my prairie playmate for a ride.

And ride, why, I've taken her—perhaps there have been more than one of her—rides in buggies, and sleighs, and toboggans; on bicycles, and motor cycles, and automobiles; in canoes, and sailboats, and ice boats, and motor boats; and even flying machines.

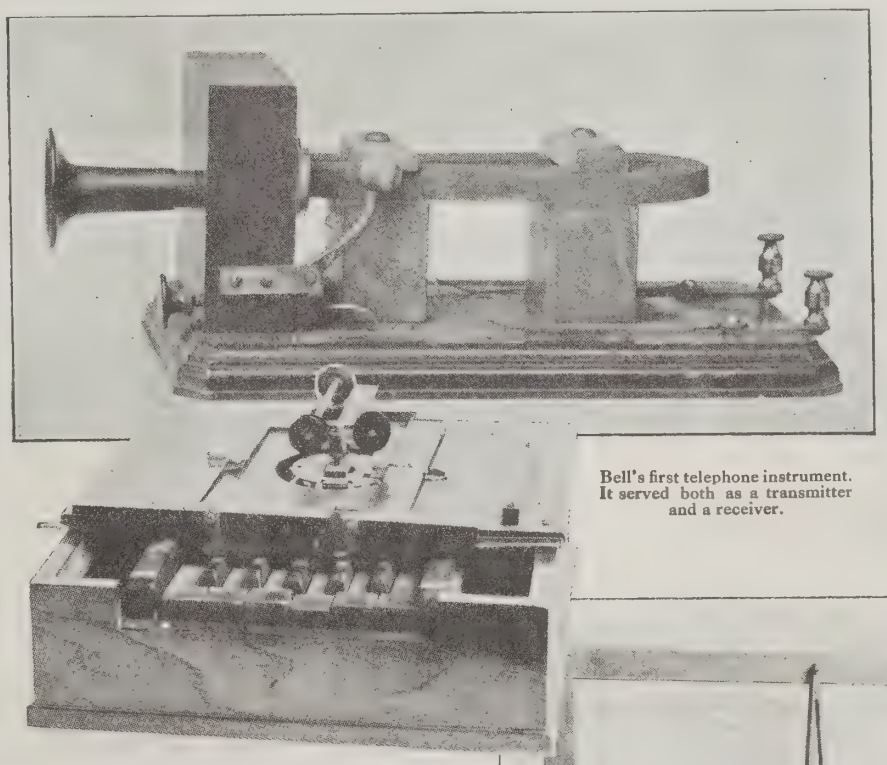
And, by the way, that last is a comforting notation, for I am told flying is a young man's game, and as I became an accredited pilot after I was 50, I feel that I am entitled to consider myself a young man yet.

I have always been an insatiable reader, and perhaps you will say that this is the explanation. So it may be, to an extent, for I learned shorthand sitting on a plow beam while the horses rested, because someone had carelessly left a textbook lying around where I got hold of it. And shorthand led to prize-winning skill on the typewriter, though I vividly remember I thought at my first session with the thing that some of the letters had been left off the keyboard.

My photographic attainments are also without farm-initiated antecedents, although from these came the motion picture, and as a hobby has been pursued until this past summer, pictures, at the rate of 1,600 exposures per second have been made. I drew the architectural and working plans of our Sixteenth street home, I am a designer of machinery, a mechanical draftsman, and a registered patent attorney.

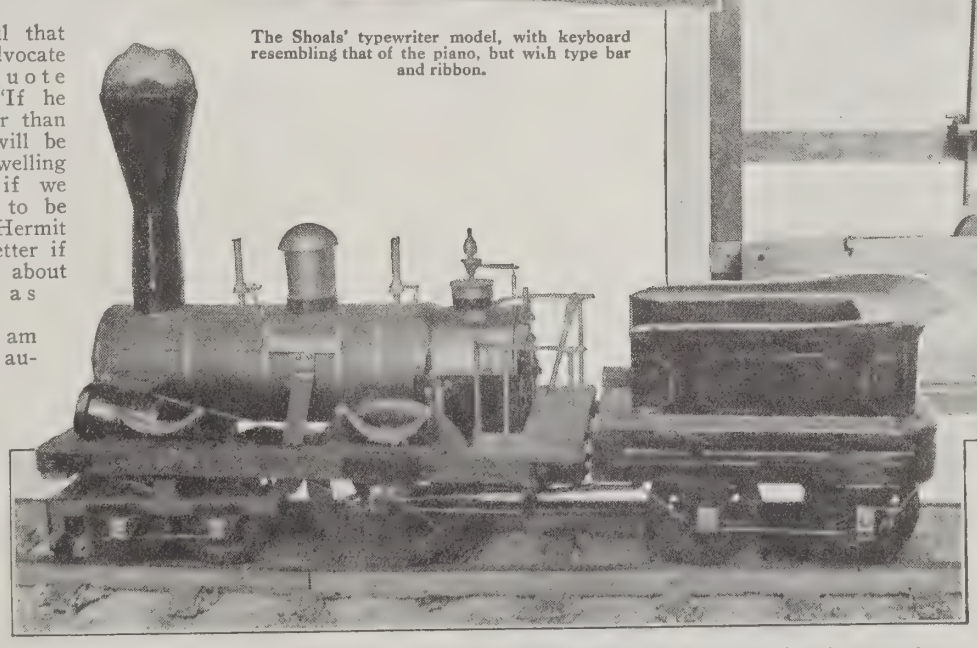
Perhaps there has been an incidental smattering of financial and executive skill, which has relieved me of acute financial worries, but the greatest reward of resourcefulness has been the pleasure which has attended each accomplishment.

However, I do not mean to imply that everyone must have so varied an assortment of attainments to insure smooth sailing, but skill in more than one thing surely gives opportunity to keep employed usefully and profitably, and creative work is the most satisfying thing there is.



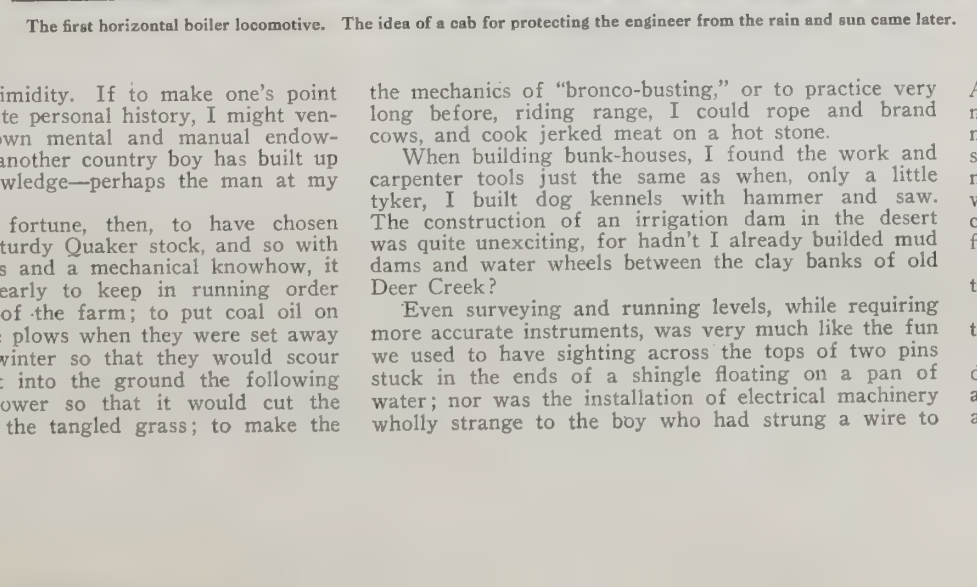
The World War brought to light the avocational talent of many a man and woman. I have in mind a young man who regularly helped his father, a successful builder, between scholastic terms, and during the winter after school hours repaired automobiles. Another winter he tended horses and did chores on a farm. When the United States entered the war, he volunteered. He knew concrete work, and was transferred to an ordnance proving ground, made a lieutenant, and put in charge of all road making, foundations, and other concrete work. He knew automobiles, and presently the tank division was added, with a promotion. Later the stables with 200 horses were put under his charge. He was given a chair on the other side of the desk of the colonel, the post commandant, who also recommended a captaincy for him. Has it ever occurred to you that most of the great discoveries are the result of an avocation, a plaything during rest-time?

The father of photography was an army officer; and of the electric motor, a bookbinder's clerk; the inventor of the telegraph was a portrait painter; and of the Jacquard loom, a dressmaker. A farmer tinkered up the typewriter; a poet, the sewing machine; a cabinetmaker, the cotton gin; and a coal miner, the locomotive. The telephone was the "after-school" work of a teacher of the deaf; the disc talking machine, the night work of a clothing salesman; the wax cylinder phonograph, of a lawyer's clerk; the type-casting machine, a groceryman. A physician made the first pneumatic tire, because his little son was an invalid.

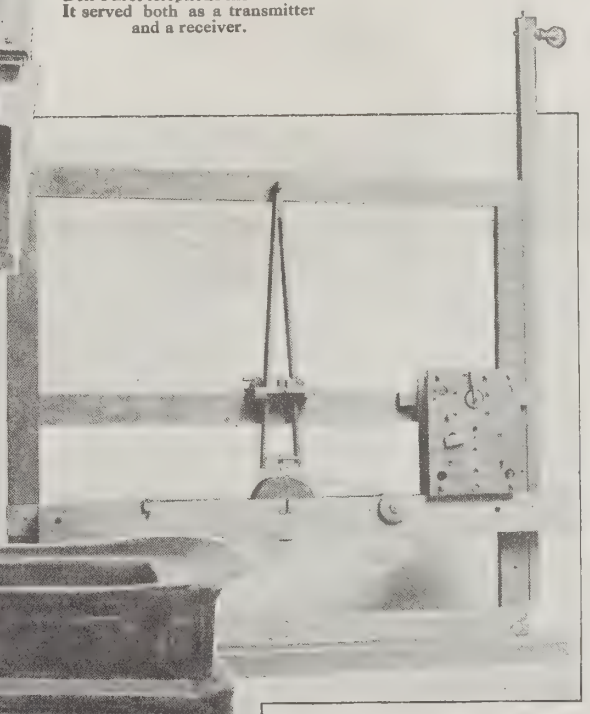


The story of nearly every great invention has been the result of someone's riding a hobby.

And that is encouraging, too, for I am led to hope that I myself may yet do something worth while.



May I, then, go back to the original suggestion—don't be a "one-lunger." Be skilled in your vocation, an expert, even a specialist if you like, but have an avocation.



Bell's first telephone instrument. It served both as a transmitter and a receiver.

The Shoals' typewriter model, with keyboard resembling that of the piano, but with type bar and ribbon.

The first horizontal boiler locomotive. The idea of a cab for protecting the engineer from the rain and sun came later.

The Morse telegraph instrument used on the first line erected. Message received on a paper tape.

Why Is Cleveland's Union Station Still in a Hole?

Concluded from page 7

of such far-reaching importance that it would have to be argued before the entire commission. He stated that the docket was so full that the hearing could not be held until some time in December.

Three weeks later, the Seattle City Council sent for Mr. Witt to fix up the traction troubles in that city. After he had gone to Seattle the announcement was made that November 12 had been set by the Interstate Commerce Commission as the date on which the oral arguments would be heard. As it was out of the question for him to leave Seattle and make the journey to Washington, Mr. Witt protested by wire and letter to the commissioners and urged them to hear the final oral arguments on some day during the Christmas holidays. But he was turned down, and the railroads went on with the hearing, without Peter Witt there to oppose them. W. A. Boyd, a noted criminal lawyer of Cleveland, and Newton D. Baker, former Secretary of War, spoke for the roads. On December 6, 1921, the commission handed down an opinion in which it *reversed* its findings of August 13, 1921. It authorized the New York Central and allied lines to take over the stock of the Terminals Company and to proceed with the erection of the passenger station on the square. However, the roads were not empowered to guarantee the bonds of the Terminals Company.

On April 26, 1922, the New York Central filed another application with the Interstate Commerce Commission, asking for authority to guarantee the $60,000,000 bond issue desired by the Terminals Company to pay for building the passenger station, and this application is now under consideration.

When the commission reversed itself in December and empowered the roads to take over the stock of the Terminals Company, Commissioner J. B. Eastman filed a lengthy, interesting and convincing opinion, dissenting from the action of his colleagues.

As the situation now stands the railroads and the Van Sweringens will be temporary winners if the commission authorizes the roads to guarantee the $60,000,000 bond issue. But that will not end the controversy. It would merely set the stage for an affair in which the entire city would participate.

There is a certain piece of property within the area of the public square terminal site, which must be acquired by the Terminals Company sooner or later to carry through the project. This property is owned by the city, and cannot be sold without action by the council authorizing the sale. The moment such an ordinance is passed any citizen can lead a movement to have the ordinance submitted to a referendum vote.

Peter Witt is the man to start just such a fight. A referendum campaign would give him an opportunity to lay the entire situation bare as he sees it.

"My demand is that the depot be erected on the Mall site because it would cost less there and not tear up so many streets," declared Mr. Witt. "Taking the depot away from the Mall will greatly detract from the group plan on which we have already spent $30,000,000. We would lose the advantage of the passenger station at that point, and have a freight yard right down in front of the city hall and the courthouse. If the people really want the depot on the square, after they fully understand all that is involved, they ought to require the Terminals Company to pay $10,000,000 for that piece of land owned by the city and which the railroads must have. That would partly compensate the city for its losses, and that is what we will insist upon if the matter goes to a referendum."

On the other hand, the Van Sweringens and allied interests say: "The public square is the only logical site for a union passenger station for several reasons. It is easily accessible from all parts of the city, and the undertaking we have under way would provide ample accommodations for all the steam roads and interurbans. Underground passage ways would prevent all traffic congestions. The area of the square would not be reduced in the least, as the depot proper would be on land to the west and south, with a main entrance in the southwest corner. As for the office building to be built over the depot, there can be no possible objection. It is permissible to split a building horizontally as well as perpendicularly. A well-known instance is where the athletic club in Cleveland erected its quarters on the sky line of an office block. In the case of the depot combination the Terminals Company would pay for its share, and the Van Sweringens would do likewise. As far as the $60,000,000 is concerned we will ask for only $12,000,000 at a time to save interest."

In view of the foregoing difference of opinion there is promise of further lively times in Cleveland over the Union Station. Meanwhile, the ancient wooden passenger station is still resting snugly in the same old hole on the lake front where it has stood for 50 years.

Cleveland's Champion Defender

Concluded from page 7

city clerk he was called upon to choose 1,908 names for use as jurors in the police court. The usual custom had been to make up a list from the hangers-on about the city hall, but Witt worked out a better system. He directed his stenographer to take the poll books and begin by picking out the first name in each precinct, and keep on going until a list of 1,908 names had been compiled. That aggregation of good citizens was later called upon to serve on juries.

After the death of Tom Johnson, the tradition that the old warrior had created, carried Newton D. Baker into the mayor's chair, and Baker further strengthened the tradition by making Witt commissioner of street railways, or "tractioner." His duties were to represent the city council in the management of the railways under a plan worked out by Tom Johnson, F. H. Goff and Judge Tayler to settle the street railway controversy.

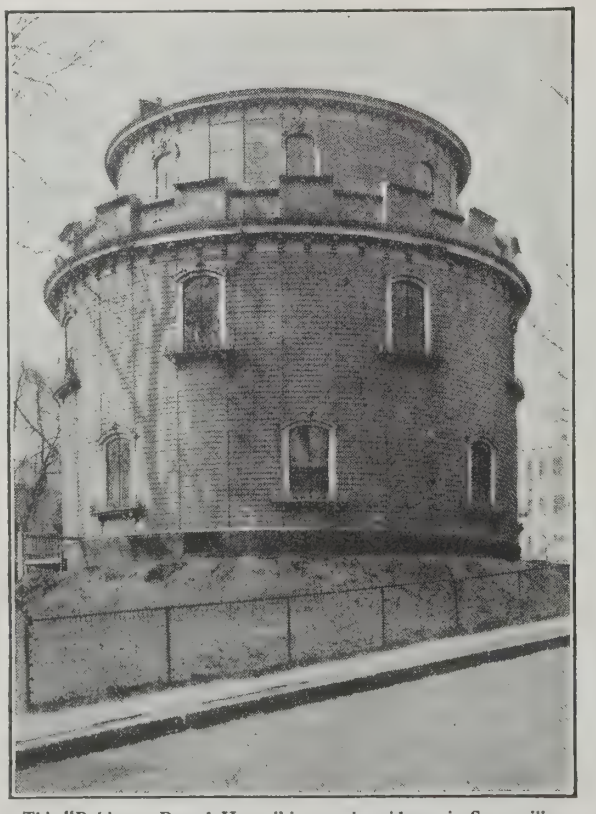
Now that he is out of office, Peter Witt is serving himself and his country by showing street railway companies how to manage their affairs. He has become a traction expert. He makes surveys, locates leaks, and shows how to get the best results in street car service.

During the prohibition campaign in 1914 he did something that put him on the front page of the newspapers, and caused a lot of merriment, for whatever Witt does always has a flavor of humor about it. The wets challenged the drys to debates in the churches, and the drys accepted. Then the wets stalled around in an effort to get out of their predicament, for a real, honest-to-goodness debate is the last thing they want. Then Pete came forward and challenged both sides to meet him in a debate at the Hippodrome, then the largest auditorium in the city. But neither side would accept. Nothing daunted, Pete announced that he would conduct a three-cornered debate all by himself. He named the Sunday night before the election, and said he would charge 25 cents admission, to pay expenses. Anything left over would go to miners who were in need. The auditorium was almost full, and Pete had the whole show to himself. He set the drys up and had the wets knock them down. Then he set the wets up and had the drys wallop them. Then he walloped both sides greatly to the merriment of his auditors. He talked for two and a half hours. When it was all over and the hall rent had been paid he had $500 left which he gave to the miners.

More recently he discussed "The Puerility and Perfidy of Party Politics." This time he used the Opera House and charged $1 admission, the proceeds to go to the North Church Forum. The Forum received nearly $1,000. On that occasion Pete talked for more than three hours, and he would probably be going yet if his voice had not given out.

Witt's devotion to the memory of Tom Johnson is the one consuming passion of his life. One reason that he wants the Union Station on the Mall is because Johnson wanted it there.

Tom Johnson died in Cleveland and was buried in New York. Several days before his death, when the future was uncertain, Witt went to see his leader.



Pointing to a gold medallion of Henry George that he always wore Johnson said:

"Pete, I want you to have this."

Then Pete knew that the end was near. He bade the stricken man goodby, and turned away. He did not return until Johnson's death was announced. When he again went to the house the family gave him the medallion which he now wears on his watch chain. Pete was the first man to be appointed to a political office by Johnson, and the last man to sit with his body before it was taken to New York for burial.

On Witt's desk rests a plaster cast of a statue of Tom Johnson. It is the original of the statue on the square. On the back of the Johnson statue is the inscription written by Peter Witt.

"Erected by popular subscription in memory of the man who gave his fortune and his life to make Cleveland, as he often expressed it, a happier city to live in, and a better city to die in, and erected on the spot he dedicated to the freedom of speech."

This "Robinson Round House" is a real residence in Somerville, Massachusetts. It may be taken as the exception which proves the rule that only locomotives sojourn in roundhouses.

Animal Myths Abound in "Unknown America"

Concluded from page 9

"and I want to look through the bushes where I'm to run."

The request seemed reasonable and the rabbit went into the thicket. He was gone such a long time, however, that the animals were suspicious and sent a messenger to look for him. Away in the middle of the thicket he found the rabbit gnawing down the bushes, and pulling them away, until he had a road cleared nearly to the other side.

The messenger turned around quietly, came back, and reported to the animals. When the rabbit came out they accused him. They agreed that such a trickster had no right to race at all, and gave the horns to the deer, who has worn them since. The animals told the rabbit that since he was so fond of cutting down bushes he might do that for a living thereafter, and he does it to this day.

As time went on and human beings increased rapidly, the animals found themselves cramped for room. To make matters worse, human beings invented weapons, and slaughtered the larger animals and birds for their flesh and skins; and trod upon and crushed the smaller creatures.

Therefore, the animals and other creatures resolved to consult upon measures for their common safety—the bears were the first to assemble. White Bear, the chief, presided.

After each bear had complained of the actions of human beings, it was decided to begin war at once. Some one asked what weapons human beings used to destroy the animals.

"Bows and arrows, of course," cried all the bears.

"What are they made of?" another bear asked.

"The bow of wood, and the string of our entrails," replied the chief. It was then proposed to make a bow and some arrows to see if the bears could not use the same weapons against human beings. One bear got a piece of locust for the bow, and another bear sacrificed himself to furnish a piece of his entrails for the string. But when everything was ready, and the first bear stepped forward to make a trial, it was found that in letting the arrow fly after drawing back the bow his long claws caught the string and spoiled the shot. Some one then suggested that he trim his claws, which was done, and on second trial it was found that the arrow went straight to the mark. But here the chief objected, saying it was necesssary that they have long claws in order to climb trees.

"One of us has already died to furnish the bowstring," he said. "Now, if we cut off our claws we must all starve together. It is better to trust to the teeth and claws that Nature gave us, for it is plain that the weapons of human beings were not intended for us."

No one could think of any better plan, so the chief dismissed the council, and the bears dispersed to the thickets.

The deer held a meeting, and after some talk, decided to send rheumatism to every hunter who killed one of their tribe, unless he took care to ask the pardon of the spirit of the deer for the offense.

The birds and the bugs and the smaller animals met. They elected the grubworm as the chief of their council. It was decided that each in turn should give an opinion, and then the council should vote on the question as to whether human beings were guilty. Seven votes were enough to convict.

One after another the members of the council condemned the cruelty and the injustice of human beings, and voted in favor of their death.

"We must do something to check the increase of human beings," said the frog, "or they will become so numerous that we will be crowded off the earth."

"See how they have kicked me around," he concluded, "because they say I am ugly, until my back is covered with sores."

Then he showed the spots on his back.

Of all the members of the council but one ventured to say a good word for human beings. This member was the ground squirrel. His speech made the others so angry that they jumped on him, and tore him with their claws. The stripes from his wounds are on his back to this day.

The council began to devise diseases to kill human beings, and they devised so many of them that had not their ingenuity run out, no human being would have been able to live in Unknown America. As the name of each new disease was called off the grubworm grew more and more pleased. Some one suggested that even slight hunger should sometimes be made fatal to women.

"Thanks!" exclaimed the grubworm. "I'm glad some more of them will die. They are getting so thick they tread on my people."

The thought of this new disease made the grubworm shake with joy, and he fell over on his back. He could not get on his feet again, but had to wriggle off on his back, as the grubworm does to this day.

When the plants heard of this they determined to defeat the evil designs of the animals. They called a council, at which each tree, herb and shrub, down even to the grasses and the mosses, agreed to furnish a cure for some one of the diseases invented by the animals.

"I shall appear to help human beings whenever they call on me," each member of the council said.

But human beings multiplied, and outwitted the gigantic animals at every turn, and they finally withdrew to the sky arch that is above Unknown America. In their places, asserted the priests of the traditions, came the puny animals we know.

One of the Most Satisfying of Our Snow Peaks

THIS VIEW OF BEAUTIFUL MT. HOOD IN OREGON IS FROM A POINT NEAR THE COLUMBIA HIGHWAY.

What of the Carnival "Under Auspices of—"?

Concluded from page 3

crime committed either by unscrupulous employers or degenerate persons who follow carnivals and take advantage of the crowds they attract. Just a few days ago came another story of crime, the arrest of a carnival attaché on the complaint of a young girl."

Such is what goes on, nine times out of ten, under "auspices" that would seem to speak for and give reliable guaranty of fair dealing to the community. To such aggregations the faith of amusement-hunger thousands in groups of good citizens who invariably are behind the organizations which serve as "auspices" is sold for a paltry percentage of the spoils!

"The carnival is here to stay!" This is the declaration of Rubin Gruberg, owner and manager of a traveling outfit which advertises itself as "The Aristocrat of the Tented World." He calls attention to the fact that last season one carnival company "grossed $150,000 in ten days."

"Much has been said and written on the subject of concessions," he says, "some arguing that they will eventually be entirely eliminated from the carnival business. I, for one, do not believe they ever will be or should be . . . . In fact, my experience has been that the public demands these concessions, and on several occasions where they have been eliminated the management of fairs, and so on, have suffered financially in consequence . . . . . The public wants them and the carnival management needs them—so there you are." Barnum's old theory that the American public likes to be humbugged!

"I am firmly convinced of the great future of the carnival business," Mr. Gruberg declared, "and will say that *I know of no other business in which so much financial prosperity can be brought to so many people* in the short space of time allowed in one season as through this branch of the amusement world." He calls attention to the fact that in five years his own big show has grown from one to five cars, "and flat cars at that!"

No one can deny that a measure of blame attaches to the public for whatever may be wrong with the "carnival show" or other things dependent for life on public patronage. But that blame could be more certainly placed if there did not stand between the showman and the public the artifice known as "auspices."

"I'll tell you where the blame lies," said one of the most reputable of carnival company owners to the writer. "It is on the public official who only needs to enforce the law to drive out of business every improper so-called carnival outfit. But for law violation, the bulk of the outfits so classified could not exist and but for the negligence or the dishonesty of the official the law would be enforced against them. The trouble is that officials too often are restrained either out of deference to those who supply 'auspices' or for purposes of personal graft. Haven't I had them come to me and suggest that I put on some features that would bring in 'real' money? In this connection, haven't I also had staid members of committees representing my 'auspices' ask that private performances at the 'girl shows' be arranged for them? Go after all of them, the crooked showman and concessionaire, the negligent or grafting official, the callous local committeemen—if they are not eliminated from this business all operators, good as well as bad, soon must look for other employment."

As "carnival show" is a term lacking clear definition and is now generally abjured by the branch of the amusement business so classified, it is difficult for statutes to bar them without at the same time barring other traveling amusement outfits that use tents.

But the official who grants the permits easily may adjudge a show by applying the simple test of "entertainment." Does honest effort to "entertain" dominate the facilities and the efforts of the organization, or is it a mere aggregation of makeshift shows surrounded by a swarm of gambling—and worse—concessions? By that test all should be willing to stand or fall—but according to wide observation and considerable data only a comparatively few could meet it.

"By their advertising ye shall know them," is a pretty good rule that is applicable to virtually all commercial activities.

In the voluminous periodical which serves as its trade paper you find pages and pages of "carnival show" advertising. What are the dominating notes in those expressions? They are "auspices" and "concessions."

There lies before me a typical trade advertisement of a carnival company. It announces that it can handle "two more high class shows, one more platform show, also first-class ten-in-one"; also it "can place a few more legitimate concessions of all kinds." Then follows the locations and dates of ten engagements. In all except three cases "auspices" are announced. In three, they are American Legion posts; in two, they are Veterans of Foreign Wars organizations—a state convention in one instance; in one they are Spanish War Veterans and in the other the "auspices" are Modern Woodmen of the World and a local police force!

"Dave (Butch) Cohen wants capable grind store man," says another advertisement.

Here's an appeal to "Magazine People," known in the slang of the carnival world as "sheet-writers" or "papermen." They pretend to be subscription agents of allegedly reputable periodicals. Listen to the advertisement: "Our patented, copyrighted check system wins their confidence, doubles your production and earnings. All standard periodicals. You collect $1, issue our check for $1. Ninety cents your commission."

One periodical advertises direct to "sheet-writers," to whom it offers annual subscriptions at six cents each—to be sold by the "agent" at whatever he can get. And the periodical in question parades as a disabled veterans' publication!

Most of the advertising, however, has to do with "prize" material used in the booths of concessionaries, like dolls, Chinese baskets, blankets and trinkets of various kinds.

You will find that the trade advertising of the business consists largely of matter like that described.

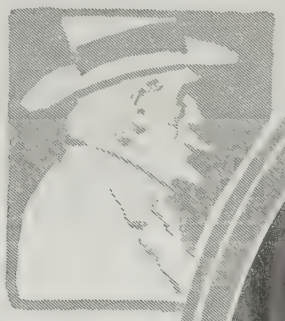
There is little in these productions that is calculated to stimulate healthful impulses. The boy who goes to the legitimate circus sees little which he doesn't benefit from even when he tries to imitate it. The tumblers and trapeze performers are incentives to athletic development, the clowns inspire a healthful, though perhaps rude, sense of fun.

But exhibitions of athletics, excepting wrestlers who too often are fraudulent vulgarians and an occasional "Wild West" exhibition of merit, are rarely seen in "carnival shows." Even the animal show, around which the Bostock show was built, and which long was a feature in most of the big carnival shows, has now been generally abandoned.

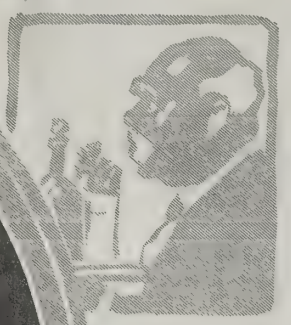
"We had to give up the animal show simply because it didn't pay," said an operator.

"The truth of the matter is," said an old concessionaire to the writer, "people have ceased going to a carnival show for honest entertainment. They go there, I am very much afraid, just to get stung. My observation has been that the average person who attends them likes to boast about how they were robbed by this or that trick, or how much they spent playing some half-crooked game to win some trinket of a prize. 'It ain't worth a quarter,' they'll say, 'and it cost me $5, but after I started I made up my mind to get it and here it is.' Such boobs are meat for the concessionaire."

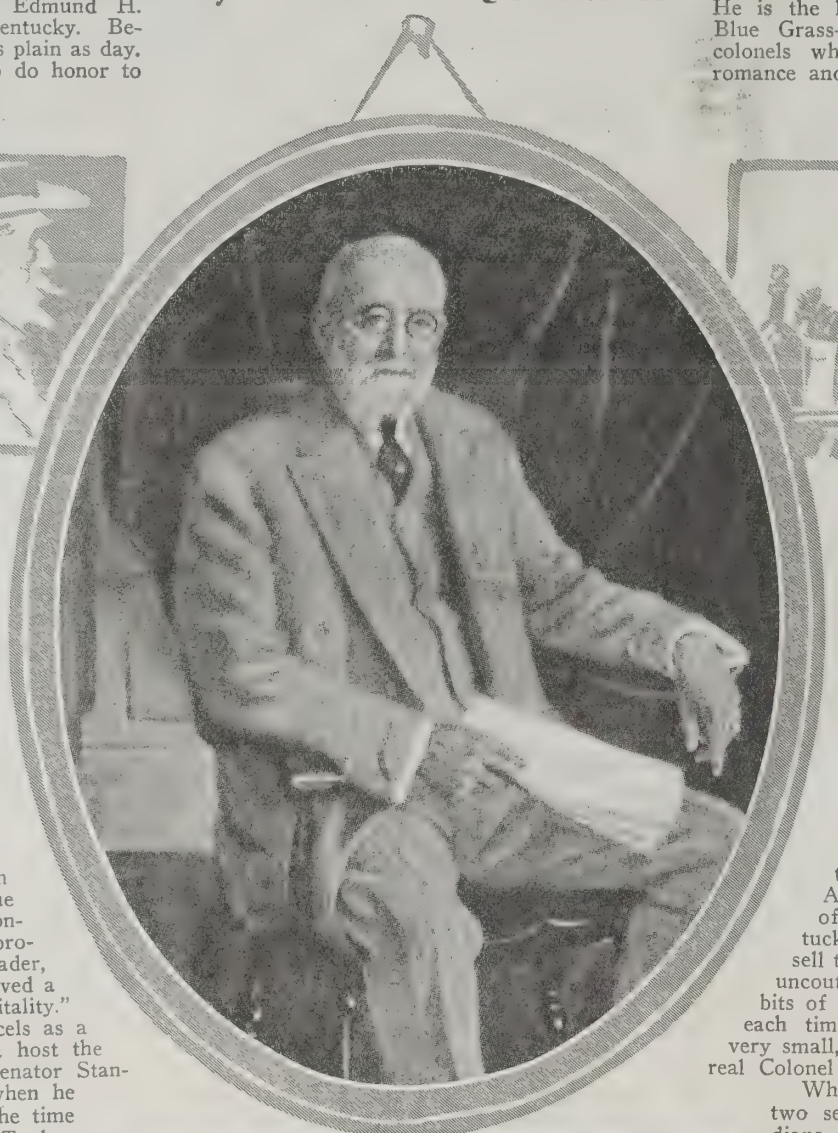
"SHOWMAN—What have you got capable of getting money?" asks one of these organizations in a display advertisement in the business' trade paper. "Book with a show that has the name and will protect its people."



Where does the public come in?



Last of the Real Colonels of the Blue Grass



The Story of the Only Man With the Degree of Master of Hospitality

By HENRY DE QUESTIER

PROFOUND respect is the real natural right of women, believes Colonel Edmund H. Taylor, Jr., of Frankfort, Kentucky. Believing thus, the Colonel makes it as plain as day. But when he wants particularly to do honor to a woman—flapper, matron of middle age, or an old lady—he sends to her by a young Negro boy a solid silver salver that is heaped with rare fruits nestling among flowers and trimmings. The salver is never carried back to Colonel Taylor. It is his gift, along with the fruits and flowers, for once accepted by a woman, the Colonel will not permit the salver to be profaned by further use.

Also, Colonel Taylor is the only man who has had the Degree of Master of Hospitality conferred upon him by the registrars of 58 colleges. The occasion was the 1917 meeting of the American Association of Collegiate Registrars, held in Lexington. For a day the Colonel entertained the members of the association at his Hereford farm, in Woodford County, between Lexington and Frankfort. Before the sessions closed a degree like the standard certificate of graduation was embossed and signed by all the registrars, because they "found convincing demonstration of his proficiency as a lavish host, a genial leader, and a cordial friend, and thus received a signal experience of Southern hospitality."

Furthermore, "the man who excels as a host in Kentucky must excel as a host the world over," said United States Senator Stanley, then governor of Kentucky, when he delivered the principal address at the time the degree was presented to Colonel Taylor. And the Colonel is Kentucky's most noted host. He established this reputation by living up to even the little details of cherished traditions of Blue-Grass hospitality, and also because he always is at it. It's a rare occasion when there is no "company" in his home. About this entertaining, however, there is nothing so ornate that it is gaudy. Liking for gaudiness is not a Blue-Grass trait. The Colonel's entertaining is democratic—and extensive. Members of associations of this sort, and of that, meeting in Louisville or, Lexington, have been his guests in Frankfort through so many years that the trip is on their programs as a matter of course. Frankfort, by the way, is about half the distance between the two cities. A hundred, and even twice that number, at luncheon or dinner is not unusual in the Colonel's home.

Colonel Taylor is well over 90 years old. But he still is going strong. His mind is alert. He is as spry, as erect, as many a young blade—he hasn't reached the age of slippers, baggy pants, and an easy chair before the fire. On the contrary, he is known as "the best-dressed man in the South." Tailors in New York and Chicago fit the clothes he wears.

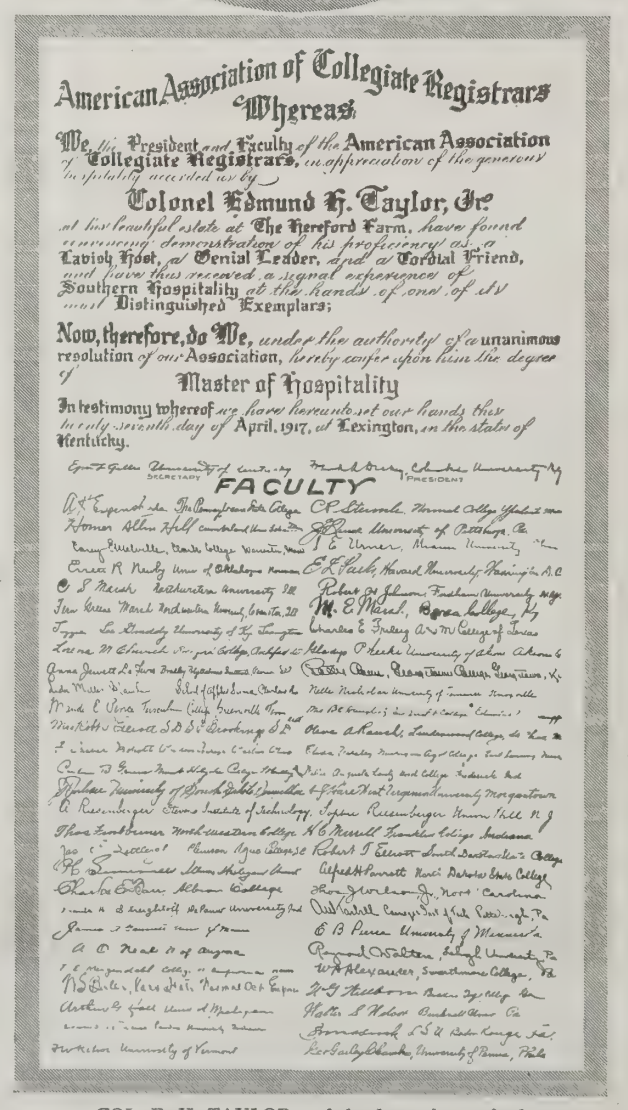
A young man was admitted to the Colonel's office.

"Well, sir," said the Colonel, "what can I do for you?"

"Colonel," was the reply, "I'm just starting in the dry cleaning and pressing business in Frankfort, and I'd like to have your work. They tell me you have a lot of clothes, and I'd like to keep them in shape."

"All right," said the Colonel, "I'll send over a few things this afternoon to see what you can do with them. If they're all right when they come back, I'll send you some more."

Later in the day 24 suits, and 16 overcoats were delivered to the cleaner.



Gossip credits the Colonel with never having less than 100 suits, and each is in style. But the Colonel is far from being a fop. He is the last of the pattern colonels of the Blue Grass—sole survivor of the simon-pure colonels who made that country famous for romance and chivalry. The pattern colonel put his best foot forward in dress as well as in all other things, and Colonel Taylor never got away from the custom.

Colonel Taylor practices the traditions of the genuine Blue-Grass philosophy of life. As a distinct type of American, the picturesque Colonel of Blue-Grass romance and history emerged from the wind-up of the eighteenth century. Kentucky was in a ticklish situation. British and Indians were north of the Ohio River. Spaniards were south of Kentucky, and west of the Mississippi River. The main route from the Blue Grass to market was by barge to New Orleans—barges were loaded at Lexington on a stream that long ago was dried up, its channel covered, and even the location of it lost sight of when river traffic declined. From Lexington the barges floated to the Kentucky River, thence to the Ohio, and to the Mississippi. An interesting chapter in the history of New Orleans describes the "Kaintucks," who brought what they had to sell there. While these "Kaintucks" were uncouth, they picked up and brought home bits of colonial French and Spanish culture each time—perhaps an aggregate that was very small, yet it went into the making of the real Colonel of the Blue Grass.

What Kentucky needed most it got—two sets of leaders. One set fought Indians, and the other took care of the statesman's job. Neither set slighted the things it did, and they finally solved all the bad situations. After a while, "an ideal principality of limited extent, meaning a score or more of counties reaching into the heart of Kentucky, laving its feet in the Onio River, sharply parting company with the mountains on the east, and refusing in its western margin to go beyond the line of uplifted limestone," took title as the Blue-Grass country—a place where "brotherhood of pride and prosperity; an ancestral look of estate; an aristocratic democracy" soon settled like a romantic blanket.

When the men who had straightened Kentucky's tangle gained leisure, they got together and followed the Blue-Grass philosophy of life. Here is how life worked out: "The old families lived in simple grandeur, made up mainly of gentility, and plenty to eat. There was an uncommon amount of brains in the country. Villages were important, and the ruling element was distributed over the land. Power was rural. The city was an appendage—a convenient place to make purchases. In short, it was a life of thrift, plenty, gentility, freedom, enjoyment, intellect." There was plenty of time for all-day visiting, driving parties, house parties, and big dinners. In this setting the characteristics of both sets of pioneers ran together. The performance flowered men and women of an unduplicated stripe. That is the reason upstarts never can gracefully pose as colonels of the Blue Grass, unless they pick another pair of parents, and literally again are born of them. The title was a romance-mark of distinction for uncommon men, and when they passed it on it went to progeny of the same feather—progeny not so picturesque, it is true, because there is less opportunity to be picturesque.

In his boyhood, Colonel Taylor was the close friend of the men whose experiences not only reached far back of his day, but whose experiences then were being used as the foundation for the Blue-Grass philos-

American Association of Collegiate Registrars

Whereas

We, the President and Faculty of the American Association of Collegiate Registrars, in appreciation of the generous hospitality accorded us by

Colonel Edmund H. Taylor, Jr.

at his beautiful estate at The Hereford Farm, have found convincing demonstration of his proficiency as a Lavish Host, a Genial Leader, and a Cordial Friend, and have thus received a signal experience of Southern Hospitality at the hands of one of the most Distinguished Exemplars;

Now, therefore, do We, under the authority of a unanimous resolution of our Association, hereby confer upon him the degree of

Master of Hospitality

In testimony whereof we have hereunto set our hands this twenty-seventh day of April, 1917, at Lexington, in the state of Kentucky.

ophy. What he was born too late to gain by experience the Colonel gained by direct contact. For instance, Henry Clay taught him thrift in a practical manner. When the verbal lessons were out of the way, he autographed and gave to the Colonel one of the first books published containing interest tables for the use of bankers.

Colonel Taylor as a boy went to school in New Orleans. Later, he spent a good deal of his time with the Zachary Taylor branch of the family in Lower Louisiana. His companion was General Richard Taylor, in his day, a famous and typical gentleman of the old and the far South. New Orleans romance of the "good ol' days," as it still is spoken of there, was in full blast, and Colonel Taylor was in the thick of it. Virginia chivalry was absorbed when he lived with the family of his uncle, Edmund H. Taylor. That is where he took on the "Jr." behind his name—it was placed there to distinguish him from his uncle, and the Colonel never dropped it. Blue-Grass philosophy of life afterward expanded marvelously and Colonel Taylor helped spread it. He keeps old-fashioned romance as sprightly as a cricket, because he never has lived any other sort of life. And that explains what otherwise might be taken as a somewhat pompous boast. The Colonel never argues. He states facts, and backs them up, as an example, by saying: "I am, without arrogance, 'deeply informed' on this subject, as the historian Motley has said of himself on another subject. I have been a student in the matter."

Colonel Taylor, when he was nearing 84 years, planned a Hereford cattle farm for the Blue-Grass country, and astonished the world by paying more for a bull to lead the herd than ever before had been paid. The farm turned out exactly as the Colonel planned it, for he never slights a detail—another characteristic of the Colonel of the Blue Grass. When he was 88, Colonel Taylor held the largest sale of Hereford cattle then known.

Attention to detail developed his unmistakable signature. It is famous the world over for the care bestowed upon it—Colonel Taylor was a Kentucky distiller and his signature was part of his trade-mark.

The Colonel lives in "simple grandeur" at "Thistleton." It is a typical Blue-Grass estate of 1,000 acres, out Louisville way from Frankfort, and on a hill that is 400 feet above the Kentucky River. The cattle farm of 2,000 acres is in an adjoining county, and is known as "Hereford Farms." But "Thistleton" is not just a show place. It is a farm that must return a profit. Yet from the house all operations are out of sight. Against this background the flag flies from sunrise to sunset. The flagstaff is at the head of the walk leading from the house to the Louisville pike.

Utility masked by beauty sums up out-of-doors "Thistleton" in a sentence. The kitchen garden, for instance, is located far away from the house, and practically is out of sight, yet to screen it from any possible peep there is a thickset lilac bush fence more than 400 feet long fringing the side of the garden nearest the house. A lake fills a depression that otherwise would be out of keeping with the surroundings. This lake is well stocked with fish, and of a morning the Colonel's guests go there to catch their own fish for breakfast. A bit of the sentiment that you find everywhere about "Thistleton" is a grave lying to the right of the house. Along in 1841 a man named Dana was reporter of decisions in the court of appeals at Frankfort. Dana and the former owner of "Thistleton" were close friends. When Dana died he was buried on the estate of his friend, and since the land came into the hands of Colonel Taylor he has maintained the grave as carefully as ever before.

Stepping across the threshold of Colonel Taylor's home is an experience no one is likely ever to forget. Nothing is complex there. That is the reason "Thistleton" gives you a new experience. Old-fashioned romance of the three types that made the entire South famous—Virginia, Blue Grass, and Louisiana—is youthful all around. Yet none of the three advances too far to leave the other two behind. The practices of famous characters of southern history open before you with a freshness that is fascinating. The library, as an instance, is lined with black walnut bookcases that reach from the ceiling to the floor. And they're not mere wall linings, together with the books that are in them. The latter have the friendly look of familiars—the classics especially—for Colonel Taylor reads, writes, speaks and entertains.

And because he is the last of the real Colonels of the Blue Grass, Colonel Taylor practices his creed wherever he goes. On that account, especially on Fifth Avenue in New York, and on La Salle street in Chicago, the coming of Colonel Taylor is an event. There he is known as the "man who has realized De Soto's dream."

Where Great and Near-Great Become Human

Concluded from page 2

talks in the lighter manner, each telling of his hobbies.

Probably the most famous of all National Press Club stunts of the lighter kind was an old-fashioned spelling bee between selected members of the club and a group of Congressmen and Senators. David F. Houston, then Secretary of Agriculture and a former university president, "gave out" the words, which were selected from the old "blue-back speller" of hallowed memories. The correspondents were defeated by the legislators. The individual winner was Representative—now Senator—Frank B. Willis, of Ohio, a former college professor.

From all this you might be led to think that newspapermen are big successes as "social animals." Quite the contrary, however, is the actual fact; it is one reason perhaps why press clubs have not been so successful generally as other occupational clubs. It often happens that individuals lunch together at the National Press Club for years, sometimes daily at the same table, and become intimate acquaintances without knowing each others' names. Rarely is a new member "introduced" and rarely does a new or old member take the trouble to "introduce" himself to anyone. It is one place where a man may be either aloof or intimate without offending anyone else. Thus the National Press Club is a refuge as well as a social center. There correspondents can escape from that artificial "mixing" which is necessary to get the news and there they can meet, if they wish to, others of similar tastes and activities.

The press galleries, as far as Washington is concerned, are not now the personification of the power of the press in the sense conveyed by Edmund Burke who, pointing to the one in the House of Commons, exclaimed, "There sits the Fourth Estate of the Realm." Today, if in Washington, Burke probably would designate the National Press Club instead. For while most of the newspapers are represented therein, the Congressional press galleries are not of their one-time importance. One reason is that the debates in the House and Senate are no longer of controlling significance, and little of the real work of Congress actually is done on the floor of either House.

Another reason is the pronounced shifting of the center of political gravity from the Capitol to the White House. In these days, important correspondents spend little time in the galleries, to which probably not more than one-third of all the persons who regularly join in keeping the public informed, through the public press, of what goes on at Washington have or need the privilege of admission. But virtually all are members of the press club, which has become in many respects the clearing house for Washington news.

To a large extent, your estimate of national public men and national measures is first formed and passed on for your adoption by members of that very interesting organization of news-gatherers and writers. For it is to them that you must look for most of your information on national subjects.

BRIEFLY TOLD

All University of Arizona students must sleep in the open air. As the climate is dry, mild and equable, it is possible to provide open-air sleeping quarters during the entire college year.

At the time of the Civil War only three per cent of the population of the United States lived in cities, while today more than one-half are city dwellers.

The Chinese prefer a paper of much softer quality for their correspondence than that made for the use of Americans. This is because the Chinese write entirely with brushes and ink. Wrapping paper of a soft, thin variety, light cream in color, is usually found in the better stationery shops, while the native shops sell a cheap brown paper.

Melting ice in the glaciers of the Alps is yielding up the bodies of persons who met their death many years ago.

A radio telephone at each of the 70 tables of a San Francisco hotel enables the diners to listen to one of several concerts that are broadcast daily. Diners now eat while listening and the hotels of the city are making preparations to have wireless phones installed in their guest rooms.

A paper tape measure is being rolled into German bolts of cloth. This permits the salesmen to tell at a glance the measure of cloth remaining in the bolt, thus economizing labor and time. The tape is marked off in yards and meters.

A substitute for cardboard and wood in boxes is a chemical composition of sawdust and ashes. The finished boxes are light, washable, sanitary and non-poisonous. They are waterproof and as fireproof as asbestos and can be made in any degree of flexibility or texture, either as hard as oak, tough as metal or pliable as cardboard. A pound of the substance from which the boxes are made costs not more than five cents.

The shifting sands of the desert of Gobi are gradually burying large portions of the Great Wall of China.

"Armored" aluminum, used in the manner of reinforced concrete, is now obtained by embedding in the aluminum mass thin steel portions which transmit tensile stresses, the surrounding aluminum being relied upon to take care of compressive stresses.

Ammonia is being manufactured from the nitrogen found in molasses in a sugar refinery in France.

"Jewish Influence on American Life," Volume III in the series on "The International Jew," comprises a third selection of articles on the Jewish Question, and is now off the press. It contains 256 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, and "Jewish Activities in the United States," Volume II, 235 and 256 pages, sent for 25 cents each.

A new method of keeping hay without curing it in the sun has been worked out in Switzerland. The newly mowed hay is stored on metal sheets in silos of 400 feet capacity. Another metal sheet closes the top of the silo and the two sheets are connected in an electric circuit, so an alternating current of from 200 to 500 volts is passed through the grass between them. This enables the grass to be preserved in its natural state until required. It can be cut and stored irrespective of weather conditions and it contains twice the nutriment of an equal quantity of hay.

Of 3,000,000 persons living in the mountain counties of eight southern states, nine-tenths are of Anglo-Saxon pioneer stock, the purest blood in America today.

Asbestos suits are made for persons engaged in work that requires fireproof clothing. Asbestos can be spun so fine that 100 yards of the filament will weigh only one ounce and cloth can be made from this weighing only a few ounces to the square yard.

"Becky Thatcher," the little schoolgirl in the Mark Twain book on the adventures of Tom Sawyer and Huckleberry Finn, is a real person living today in Hannibal, Missouri, the old home of Mark Twain. She is 86 years of age and is matron of the Home of the Friendless there.

Charles Darwin's home in the Kentish village of Down, where he lived for 40 years, is being offered for sale.

A community cow, rented out at $1 a week to families in the congregation who have children, is the property of the Church-by-the-Side-of-the-Road in Greensboro, North Carolina. The proceeds realized from this rental are being saved to buy other cows and eventually there will be a community herd to supply milk in large quantities for all the children in the congregation.

A new stump-burning method employed in Washington consists of placing an apparatus against the stump with a flue and blowpipe in position. A draft created by the blowpipe turns the inside of the stump into a mass of coals, the fire eats down into the roots and the entire stump is consumed at half the cost of former methods.

The average pay of 170,000 clergymen in this country is $15.54 a week.

President Harding has a copy of the *Marion Star,* his own paper, delivered at his executive desk every morning and he reads it before he does anything else. Throughout the day it is neatly folded away on the left-hand corner of the desk for ready reference.

The oldest post-office building in the United States is in St. Augustine, Florida. Records at Seville, Spain, show that the structure was erected some time between 1568 and 1603 by Gonzalo Mendez. The King of Spain bought it in 1604 for a residence of the Spanish governors of Florida.

Six hundred letters written by Charles Dickens to the late Baroness Burdett-Coutts, sold recently in London for $2,150.

The first sawmill within the Arctic Circle will soon be established at Herschel Island, at the mouth of the Mackenzie River. The engine accompanying the mill is of the two-cycle kind, without carburetor or ignition, and can be run on fish oil or crude petroleum from the Fort Norman wells.

The Stone Age existed in British Columbia up until as late as a century ago, according to prominent archeologists who have been exploring old community sites, mounds and graves along the coast and in the interior. Stone and bone tools were in common use when white explorers visited the North Pacific, although copper and iron were found almost everywhere. Stone hammers and axes discovered are almost identical with the tools of the neolithic man found in Europe. Old shell mounds on the Fraser and Thompson rivers reveal many things formerly used by man of the Stone Age.

Nearly fifty thousand million dollars is invested in insurance on the lives of Americans.

Flashing across the skies of Virginia, a meteor struck in a grove of oak trees in the south central portion of the state, making a depression in the earth which measured more than 500 square feet in area. The meteor was composed of a metallic substance and several trees were buried beneath the falling body. Homes in near-by towns were rocked by the concussion.

In Washington: Ships, Dinners, Liquor and Lasker

Social Lobby's Methods Perfected, Used More Cleverly Than Ever Before

MAYBE you have wondered why a man you despised at home became a Big Gun at Washington. You wondered, because you thought brains and principle and worth ruled there. They don't. The game is not played that way. It used to be, but not now.

This story tells part of the tale—only a small part. There are reticences which every good citizen wishes to observe. But it is useful to know why, for example, the ships of the United States Shipping Board have not been criticised in the public press, by newspapermen who knew the facts, for their violation of American liquor laws. The explanation is the dinners given to newspapermen by Albert D. Lasker.

Maybe you have wondered why Lasker could get the White House itself to boost Shipping Board affairs into a prominence not granted any other issue—not even those issues important to the welfare of the people. The answer is, Lasker's dinners.

This is only a small part of the story. Some day, if public policy requires, there will be an explosion of truth in Washington, when all the now-suppressed facts will be blazoned before an indignant people and a thorough clean-up inaugurated.

By STEPHEN POOLE

THE social lobby in Washington is not a new institution, but it has perfected its methods, and is being used more cleverly than ever before. It is one of the most potent influences in the life of the national capital. The ends sought are not always visible to the casual observer. The methods employed are often extremely subtle, and even those persons whose high official and personal standing is being traded on are usually unconscious of the purposes which the schemers are seeking to accomplish.

Whether it is a tax bill before a congressional committee, a big claim before an executive department for adjudication, publicity for a governmental subsidy, regulatory measures affecting special interests or a Federal appointment that is sought to be influenced, the social lobby is sure to play a big rôle.

Senator Kenyon, of Iowa, who was recently elevated to the Federal bench, and who had a great deal to do with turning the light on lobby operations at Washington during his service in the Senate, gave it as his matured opinion that the social lobby is one of the most active and pernicious of all. It is in full blast at the present time.

Washington's "Information" Men

IT WAS Senator Kenyon who first brought to light the remarkable case of a former newspaper correspondent in Washington, who, by skillfully ingratiating himself via the social lobby route, reached the point where he was drawing approximately $50,000 per annum as the aggregate of retainers paid to him by various interests having irons in the legislative fire at the National Capitol. This young man was one of the first to see the possibilities of the social lobby. Having a wide acquaintance with public men through his former newspaper connections, he took an apartment in the most expensive downtown hotel in Washington. He and his wife entertained lavishly. Members of Congress and other high government officials were among his guests. He soon developed an almost uncanny faculty of getting what he wanted. He was able to advise his clients, who happened to be interested in food lines, well in advance of the actual appointment, and before it was known outside the White House, that Herbert Hoover would be named American Food Administrator. He was *persona grata* in high government circles and was usually able to tip his principals to any impending action at Washington which it was to their advantage to be posted on before the news gained circulation outside of inner official circles. He obtained much confidential information which made him a valuable political and economic adviser for his clients among the largest business interests of the country.

Many big concerns today maintain "information" men at Washington. Not all these are lobbyists in the accepted sense, but by the judicious distribution of hospitality they are able to get much valuable advance information as to policies that are maturing in the official mind.

The importance of social activities has been so magnified in the minds of some of the lesser lights of the official constellation that publicity machinery appropriated for by Congress, and paid for by the taxpayers, has been used to get out notices of social events to obtain wide publicity and react to the social prominence of those concerned. "Coming out" parties of debutantes in the official set have been press-agented in this manner and details of other social affairs have been given to a waiting world through these channels.

An effort is sometimes made by means of the social lobby to mellow the attitude of the daily press toward pending projects. Recently, when the ship subsidy legislation was submitted to Congress, and was subjected to the fire of newspaper criticism, Albert D. Lasker, chairman of the United States Shipping Board, who is the chief sponsor of the measure, gave a dinner at his home for the Washington correspondents. Invitations were telephoned to all the representatives of the more prominent newspapers. Lasker is comparatively a newcomer in Washington and the newspaper men thought it not strange that he should desire to establish closer contact with the press. More than 80 correspondents responded, a majority of them without knowledge of the purpose of the affair. A pleasant evening was had. When the cigars were reached and the chairs pushed back from the dinner table, many of the guests were surprised when their host trotted out his hobby and in a neat speech extolled its good points.

To make the setting complete, the President of the United States, Secretary of the Navy Denby and Assistant Secretary Theodore Roosevelt were among the guests of the evening. The occasion was not a dull one, despite the Eighteenth Amendment.

A famous Chicago attorney, who recently argued a case of national interest before the United States Supreme Court, entertained several press representatives at his hotel, where the Volstead Act was no deterrent to the Bacchanalian tendencies. It is to be presumed that the spirit engendered by this hospitality did not react unfavorably in the press notice of the case in which this attorney was appearing. This method of currying favor has long been a practice with this lawyer, who has amassed millions and bears all the hallmarks of success.

The influence of White House dinners in keeping members of Congress from straying off the administration reservation has long been recognized. President Roosevelt once said: "A man who can be bought with a dinner is not worth much." Nevertheless, it is well known in Washington that many Senators and Representatives under the present and past administrations have been deterred from insurgency by the pleas of wives and daughters that it might result in their being cut off the invitation list for White House receptions and dinners.

Washington society is dominated by the official element. Once a Senator or Representative is defeated for public office, with rare exceptions, his family loses the coveted privilege of attending teas, luncheons, dinners and receptions in the official set. This is indeed a sad circumstance in the lives of many and it has influenced more than one public man to try a political "come back." Not even St. Elba could be so lonely to some of those who love the social atmosphere of Washington as to be reduced to the society of "mere friends."

The "House of Mystery"

AN APARTMENT hotel in the exclusive northwest section is the domicile of several highly placed government officials, including at least one cabinet officer. This hotel is a favorite with the men who come to Washington on missions which require something more than routine presentation at the departments or before congressional committees. Here they are afforded the opportunity for intimate social contact with the heads or assistant chiefs of departments and others of influence in government circles. This hotel is the scene of many festivities. Many gay parties enliven the evenings there. There, where "dull care" is a stranger and where members of the official set are always on hand for a dance or a dinner, many a big government deal has been made.

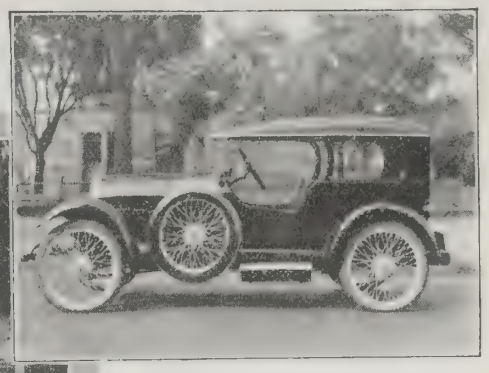
Another place where the social note predominates is a famous "house of mystery" owned by a Washingtonian of more than local prominence and of independent fortune. It is located in the business section of the city and has more than one secret entrance, where those who for official or personal reasons do not wish to have their social activities advertised, may attend its functions without detection. During the past winter, dinners rivaling the Sherry dinners of New York, were held in this house, with dancers from visiting shows supplying the entertainment on at least one occasion.

How the social lobby may be converted into a valuable asset to aid in the development of a lucrative business is well illustrated by a case which has caused much gossip in the inner circle at Washington. The principal is a man whom we will style "an Ohio attorney," although he was not exactly a shining light in his profession at home and his business was not entirely restricted to the arguing of cases in court. He had been connected in a small way with a cabinet member who is reputed to be a close political adviser to President Harding. The Ohio attorney spent several weeks as a hanger-on at headquarters at Marion during the front-porch campaign and had identified himself with the administration in the eyes of many persons who wanted favors here. He took quarters in a Washington hotel and "opened up for business" soon after the last presidential inauguration. The word was passed around by his runners that those who needed help might find it forthwith by applying to this individual. He was a smooth talker and business came fast. Soon larger quarters were required. A pretentious residence on K street, near those of several Senators, was rented. Here big entertainments and dinners were staged, with all the pleasant accessories of music and dancing by professional entertainers. These were invitation affairs.

Only Provided the Scenery

THE dinners at the K street residence are said to have been well-appointed affairs which would have done credit to a cabinet member. Those who received his invitations felt themselves honored. Many of the guests now realize that they were only a part of the interior decorations. They only provided the scenery which made the attorney's entertainments go well. The host's fame grew apace and he thrived wonderfully. He made many new connections. Sometimes he took his "cases" on a contingent fee basis, but more often he insisted that those who needed his assistance should pay a generous fee in advance as an evidence of good faith, with more to come when success crowned his efforts. Prominent persons in the administration were inveigled to dinners, and there the "suckers" were given an ocular demonstration of the standing of the Ohio attorney with the official set. This man prospered at an amazing rate as the early months of the Harding Administration flew by. Finally, his operations became a scandal and the news of his activities is understood to have reached the White House. He was asked to pitch his tent elsewhere. He took the hint and his departure was expedited by an order from the executive to heads of departments to disregard his claims of special influence with the administration. When he shook the dust of Pennsylvania avenue from his well-groomed feet it is reported that he was richer by several hundred thousands for his sojourn in Washington. This man was a clever manipulator. He had the knack of dropping little intimations as to his alleged close personal relations with administration officials without appearing to do so. He had been a "fixer" in Ohio and professed to be able to arrange matters for those who had the price and wanted favors here. Whether he was ever able to deliver anything more tangible than promises is not ascertainable.

These are only a few instances of the modus operandi of the "social bloc" at Washington. Its tentacles reach out and form a network around government operations in the national capital.

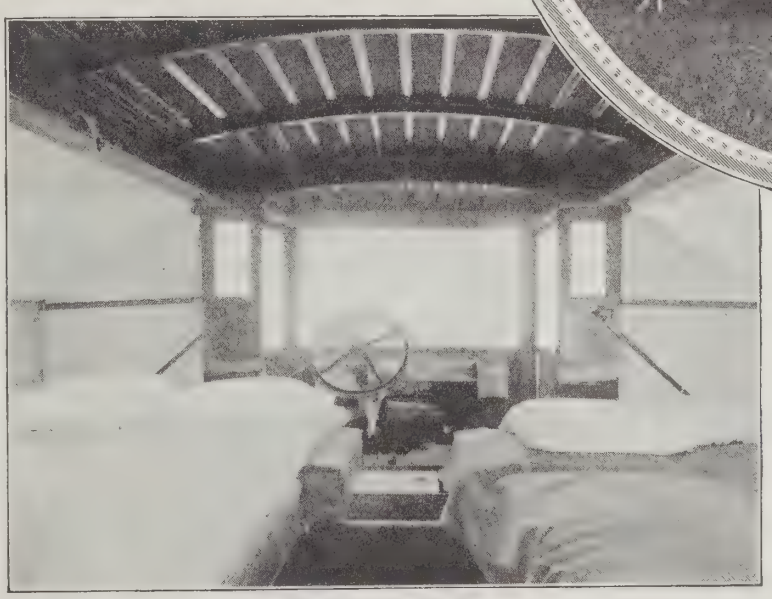


The Call of the High Road: Auto Camping

Some Facts About the Fastest-Growing Sport in the World

By GEORGE W. SUTTON, JR.

A standardized camping body for the Ford chassis. This body comes in sections, like a bookcase. It can be set up in two hours. It has two wide beds, accommodating four persons, rain and dust-proof lockers, refrigerator, folding table, complete cooking and table utensils and stove. It costs $735.



This is a new body and a complete camp car for two persons. The seats fold down forming a bed 48 inches wide, the back folds outward to form extra length for the bed and to supply space for luggage. There is an icebox, and side curtains exclude the public and weather.

A scene in the Los Angeles Municipal Motor Park where many thousands of camping parties stop annually.

A trailer set up in the woods.

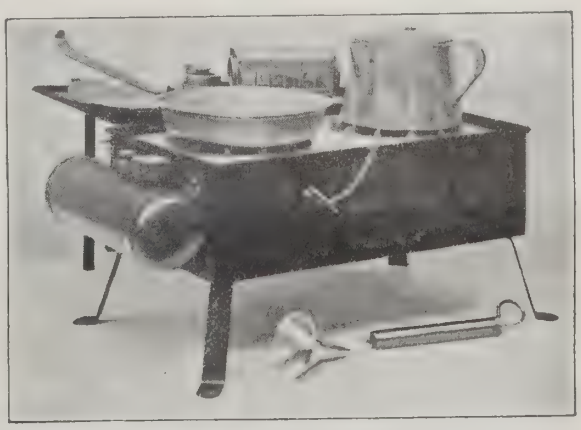
The interior of the car pictured above, at the left, showing sleeping accommodations.

WHEN 1,000,000 Americans adopt a new sport in the short space of five or six years, it is high time for the rest of the population to do a little investigating to discover, if possible, the lure which attracted the original million. This is exactly what the rest of the population is doing—with most gratifying results. The sport under the microscope of public inspection is automobile camping and the thousands of converts to its pleasures this year present ample proof, if any were needed, that here is something new, something wholesome and something practical in the way of recreation.

Back in Robin Hood's day, the gypsy was a picturesque sort of individual, but his habits were bad. Too often he had to be hanged by the neck until dead before he was properly impressed with the desirability of civilization. This was a shame, because, after all, he had the right idea. There is hardly one of us who has not inherited from the wanderer of the glittering wagons a yearning for adventure and freedom; a desire to roam the world at our own sweet pleasure, with no time clocks to punch, no domestic calls to answer.

Formerly, when a citizen and his family desired to go camping, he was surrounded with inconceivable quantities of red tape, inconvenience, expense and lost time. He had to depend upon railroads and horse-drawn vehicles to get him to his chosen camp site. And with his tents set up in a certain spot, it was there that he had to remain during his limited stay in the wilds because moving to another location called for more energy than he was willing to exert and more loss of time than he could afford.

The whole proposition became a Herculean task, not to be repeated except by the most adventurous, most hardy and most persistent of nature lovers. To go camping by the old methods now, with railroad fares sky-high, would call for the outlay of more time and money than the average man can afford. Therein lies the great advantage of motor camping. It is distinctly a sport for the average man and his family.



The great growth of this new method of vacationing is due entirely to its two main characteristics; it is practical and it is cheap. In other words, it has been proved by hundreds of thousands of gasoline gypsies during the past two or three years that automobile camping produces the utmost in pleasure and health for the minimum expenditure of money. That is why increasing hordes of us, who previously got most of our adventure from fiction magazines or wandered the world through the medium of the outing pictures in the movies, are taking to the highways and carrying our own hotels with us. We have discovered, suddenly, if we are in moderately good circumstances, that we can do better globe trotting than the millionaire with his private car and steam yacht, and that for a hundredth of the sum he spends we can take a trip as long as his and get more out of it spiritually, physically and mentally than he does. For the only requirements for successful motor camping are a little money, a little time, a dislike for crowded cities, a love for fishing and good air, a desire to roam, some brains, a good deal of natural decency and courtesy, and a car no matter how small and cheap, or even a motorcycle and side car. We can do proper and profitable motor camping with remarkable ease and lack of fuss, whether our available time is a week-end or a couple of years.

There are four ways of going motor camping. A majority of gasoline wanderers pile a miscellaneous assortment of equipment into a touring car or sedan and set up and take down their tents, beds, stoves and so on, at each stop. With this method great care must be used in packing to secure the best balance. Most beginners carry infinitely too much equipment. There is a happy medium, only learned by experience. The only disadvantages in carrying passengers and luggage in the same car are that there is not much room to move around in and it means all the labor of making and breaking camp at each jump. The trailer presents two other methods of camping. There is the little commercial trailer in which tents and other duffle may be carried so that the leg room of passengers is not taken up. This, likewise, calls for continual making and breaking camp. But there is another kind of trailer which obviates this difficulty. This is the newly conceived camping trailer which is now being made in as many different styles by about 20 companies. These trailers differ in details. Some collapse, when traveling, to a size not much greater than a child's express wagon; others follow along behind the car with their roofs fully expanded and tower above the tonneau of the car. All, however, provide comfortable sleeping accommodations for from four to six persons and many of them have, built integrally, elaborate cooking and eating facilities, folding tables and chairs, full-length clothes closets, tanks for hot and cold water and other aids to comfort on the road. A loaded trailer, contrary to the opinions of the uninitiated, does not add excessive strain to the car. There

(*Concluded on page 11*)

Aluminum dishes and utensils for four persons. The whole outfit fits into the little canvas bag, and occupies little room in the car.

An efficient two-burner gasoline stove which folds into small space. The pump is for creating air pressure in the tank.

Did You Ask for a Revised Tariff?

THE tariff is being revised, at whose request and for what purpose, has not been publicly announced. They are doing it very quietly, yet drastically, but the silence is likely to be broken by sharp popular protests when the teeth of the new tariff begin to bite. The present tariff revision is marked by a kind of secrecy. It has proceeded under cover of other more sounding matters. There is no public discussion, as has been the case in previous tariff revisions. There are no speeches on tariff principles. An utter absence of such wheezes as "protect American industry," "maintain the American standard of living" is probably accounted for by the fact that coincident with the revision of the tariff upward is a revision of the general wage scale downward. It would be exceedingly bad political strategy to bring the two matters to public notice at once. And thanks to the blind publicity which is the people's daily "news" the two have been kept pretty well apart in the public mind.

The folly of tariff revision just now is apparent. First, the tariff is not responsible for any present condition of which the people complain. Second, its half-secret revision suggests the payment of election promises: no one wants the tariff except a few interests who will benefit by it at the expense of the American people: we have learned now that the tariff is paid by the people and by no one else. Third, any tariff made in the present unsettled condition of business and the constant readjustment of values must inevitably be an unfit instrument for conditions that will ensue in the next year or two.

The haste to revise a tariff, while more vital matters are pending, does not give the mind an impression of high statesmanship.

Unfair to Mr. Babson

TRADE papers quote Roger W. Babson, the statistician—but at times only in part. If anything in his reports tends to place their particular interests in favorable publicity, it is certain to be taken from the complete text and made the foundation for views other portions of Mr. Babson's observations might discourage.

As an illustration, the title of one trade paper's condensation of a recent circular states that "Labor Disputes Hold Business Back," but a fact only partially the reason for the slowness of the promised revival of general business.

Mr. Babson is not responsible, of course, for this perversion of his general opinion. He recognizes other contributing causes and mentions them. That the effect of the omission of these has a tendency to convey the impression that to labor disputes alone can be traced laggard business is not his fault.

The truth is that no permanent revival need be expected until agriculture regains its feet and has made at least a partial recovery. With that accomplished, the revival will start, and labor troubles will be found to have been incidental rather than causative.

Labor troubles are merely a symptom of the general business malady. Employers attempt to save themselves by reducing wages; employes resist because they see the cost of living on the upgrade and already have difficulty in making ends meet. With the resumption of demand for the products of labor sequent upon revived agriculture, the question of wages must subordinate itself, since employment will leave none idle on the market.

The man, be he editor or the employer of labor, who seeks an unfair advantage in a case where a part truth has all the deception of falsehood, is as much a distorter of facts as he who utters absolute misstatements. In this case the wrong includes unfairness to Mr. Babson.

Why Do the Financiers Rage?

NEVER was such a flood of bankers' propaganda let loose upon the country as during the past five months. All because THE DEARBORN INDEPENDENT suggested that you cannot run a broad-gauge business on a narrow-gauge monetary system. Literary liars have set forth in bank circulars and financial columns and Wall Street publications that the destruction of the gold basis was being advocated, that the uncontrolled issue of paper money and a general upheaval of sound business policy were being urged. A perfect rage of resentment and deception has characterized the pronouncements of the professional financial world—and not only rage and deception, but an appalling amount of ignorance. The average man who handles the people's money knows less about the monetary structure than the ordinary ribbon counter clerk knows about the textile industry.

THE DEARBORN INDEPENDENT maintains what everybody knows, that business is strangled in its functions because the neck of money through which it must pass is too narrow; and that money also is strangled in its functions because the neck of gold through which it must pass is too narrow. There is more wealth than there is money; there is more money than there is gold; yet the private owners of gold hold the whip hand over money, over industry and thus over the people's life. It is not a question of THE DEARBORN INDEPENDENT shoving the world off the gold basis; it is a question of the world seeing that it is already, by the very force of business necessity, shoved off the gold basis. Seeing this and acting upon it will release the nation's energies and liberate us from the stupid tie-up into which the gold superstition has thrust us.

The propaganda of the financial interests is not a new thing. Indeed, it is older than the Christian Era. We herewith present two such circulars issued in our own country.

One is the famous Hazard Circular, issued in 1862. Read it:

> "Slavery is likely to be abolished by the war, the power of chattel slavery destroyed. This I and my European friends are in favor of. For slavery is but the owning of labor and carries with it the care of the laborer, while the modern or European plan is capital control of labor by controlling wages; this can be done by controlling the money. *The great debt which capitalists will see to it is made out of the war must be used as a measure to control the volume of money.* To accomplish this, bonds must be used as a banking basis. It will not do to allow the 'Greenback,' as it is called, to circulate as money for any length of time. We cannot control them. But we can control the bonds, and through them, the bank issue."

Another circular issued by the American Bankers' Association, in 1877, follows:

> "It is advisable to do all in your power to sustain such newspapers, especially the agricultural and religious press, as will oppose the issue of greenback paper money, and that *you also withhold patronage or favors from all applicants who are not willing to oppose the government issue of money.* Let the government issue the coin and the banks issue the paper money of the country, for then we can better protect each other.
>
> "To repeal the law enacting national bank notes, or *to restore to circulation the government issue of money, will be to provide the people with money* and therefore seriously affect your individual profits as bankers and lenders."

There you have it. The old circulars were more honest than the present ones—they spoke truthfully the animus behind them. But they are still the same in their bludgeoning of popular thought. Differences exist, however, especially in this, that today the agricultural and religious press is no longer the subsidized organ of an insufficient money system. The Money Power has made stupendous gains since 1877, but so has popular understanding of its methods. And that is what brings about change, and evil becoming so big that its removal is necessary, and a public opinion becoming so great that it can effect the removal.

Well, What Can We Expect?

THE American flag still flies over booze, thanks to A. D. Lasker.

Mr. Lasker is an advertising agent who took the solemn oath to support the Constitution and laws of the United States and administer the office of Chairman of the Shipping Board.

Now he is engaged in the business of advertising in every port to which he can send an American passenger ship, that the United States permits its officials openly to flaunt its laws.

Liquor, all kinds of liquor, has been sold for months on the Shipping Board liners. Mr. Lasker by devious methods sought to prevent the subject from being discussed publicly. He failed. His defense, when the charge of impeachable violation of his oath of office was made, was the weakest imaginable. He fell back on the plea that the liners could not sustain foreign competition unless liquor was sold, and in addition the Supreme Court had not finally ruled that the Eighteenth Amendment to the Constitution was applicable to ships on the high seas.

Few minds would have dared to formulate such excuses. The commercial side of prohibition with the question of its financial necessity to government and private individual was argued for long years while this country was considering prohibition as a policy. The overwhelming sentiment which compelled the enactment of the prohibition amendment to the Constitution and the laws for its enforcement have settled that argument, and made it the fundamental law of this land that neither government nor individual shall profit from an outlaw industry.

As for the lack of a high court decision, that excuse is nonsense, and deserves a worse name. United States district courts have ruled the law applies to United States ships. The Department of Justice under a former chief ruled likewise, and Mr. Lasker has sought no opinion from the present Attorney-General to the contrary. He doubtless fears that Mr. Daugherty could only repeat the former opinion. It has been the acknowledged law of the nations since earliest times that a ship on the high seas is territory of the nation in which it is owned.

The United States has held itself out as a nation intent on abolishing the evils which flow with liquor. There are a few, very few, public officials who still express openly their opinion that the enactment of prohibition was a mistake and that the country should return to license. These few have the right to their opinion and the right to express it.

But Mr. Lasker's offense is different: He is the *only* official high in public life *who has dared openly to announce that he will not enforce the Constitution and the law of the land.*

The Newspapers

IN "Pillar to Post," the readable daily "colyum" of the Chicago *Evening Post,* a contributor who signs "E. J. C.," pronounces this judgment of public taste upon the newspapers. All good readers will heartily indorse its sentiments:

THE SCARE HEADS

The multitudes who pay their dough
To make the daily papers go
May get the chance to read, some day,
That news for which they meekly pay—
For "Valentino's free at last"
And "Ganna Walska's suit is past."
When all the matrimonial musses
Of giddy men and painted hussies
Have been announced in twelve-line Gothic
It may be easy to Hypothecate
Some space to use
For printing of the daily news.
When each whozis and whatsername
Are fed up on an inky fame,
And editors enough have got light
To know fit subjects for the spotlight;
When Madelynne's last trial is o'er
And Arthur he shall be no more
A fixture on the premier page;
When Stillman shall grow still—and sage;
When 'Tilchen's fancy for Max Oser
And his for her shall turn sub rosa;
When "reel" news for real news
Is left among the residues;
When gen-u-ine folks
Not gin-and-wine soaks
And public life not public capers
Are given preference in papers—
When these changes all are made
And laws of decent taste obeyed—
Why citizens who pay their dough
To make the blooming papers go
May get a chance to read each day
The news for which they hope and pay.

E. J. C.

Mr. Ford's Page

TARIFF, Subsidy and Bonus—these are the three bugbears which have disturbed Congress for a long time past. Their power to disturb is twofold. First, there is the unnatural character of the things themselves; that is to say, the idea of the tariff, the idea of a subsidy and the form of the bonus are all unnatural. They have no place in the economic fitness of things. They are not rooted in universal principle. There is no basic solvent in them. They are not in any sense final, not even approximately final; at the best they are temporary makeshifts. Extend them universally and they would collapse and bring society down in collapse with them. Everybody recognizes that. And then, second, there is the political complication. Too many men in Washington have been led to believe that political safety depends on getting these things out of the way. To force action on a matter that is economically false for a purpose that is politically puerile, is a very active source of disturbance.

What is wrong with these things? Well, just now, the most apparent fault is that they all have the object of taking money away from the people. Tariff, Subsidy, Bonus, none of them contains a single provision for making money more plentiful among the people by releasing the productive energies of the people. It would seem that in these times, of all times, the effort would be to put the people into ways of earning money, instead of devising more ways of taking money from them.

That is perhaps not a criticism that would appeal to statesmen: it is too simple. But it is a criticism that distinctly belongs to statecraft. Congress cannot be blamed, because Congress is now in a position where it can do little but act upon what is put up to it; that is to say, our system has become stiffened into rigidity, until practically all our public business consists of inventing or operating devices to take money away from the people. What a change it would be, what a welcome change—how it would sweep over the land like the breath of a new Spring—if only there were some effort made to start things in which the people could share prosperously! Why should bills to take money away from the people always be given the precedence to the total exclusion of bills that would put the people in the way of making money?

Take the tariff. After all is said and done about the protection of American industry, what is the tariff? *It is a tax on the people.* It is not a tax on *things,* but on *people.* Our taxes recently have become taxes on *people* more than on *things.* How many times is the same wealth taxed in our income taxes because, forsooth, it has come into the hands of different persons. The workman draws his wages and is taxed on them: he pays his doctor's bill, and the doctor is taxed on that; the doctor pays his bills, and the receiver of the money is taxed on that; and so on. It is not the money which is taxed, but every person who handles it. It is quite proper to tax a thing once for all, to tax wealth once for all, but to tax *people* will lead into paths which this country had better not enter.

The tariff is primarily a tax. Nobody pays the tax but the people. And nobody receives the tax but the interests for whom the tariff was made. We were made to believe ten years ago that the country had learned this and that the government was acting upon it, but in this year 1922 there is proposed a tariff which makes previous tariffs look like amateurs—and it looks as if American education will have to be begun all over again.

Tariff means high tariff—it always does. Tariff boosters are not interested in any but high tariffs. And the winning fallacy about it all is that the government needs the tariff to pay the expenses of government! The fallacy is that the foreign shipper pays the tariff, the government collects it and applies it to government expenses, and we the people are relieved of that much expense. And in the same breath the tariff is said to discourage the foreign shipper so that he shall not interfere with American industry! Now a high tariff cannot do both these things—keep out foreign goods and let in foreign goods at high duty rates. Nor does it. What it does is to permit American exploiters to charge the American people anything they like, at the same time denying the American people access to a competing market. The tariff wall shuts in the American buyer. The American people pay the tariff, *and they pay it not to the government but to private American interests;* so, therefore, the tariff must be classed among those measures whose sole purpose is to take money out of the American people instead of helping them to get more money. The history of tariff operation has been the increase of privilege, the enormous increase of bonded debts, and the consequent increase of uncertain conditions of life among the people. How could it be otherwise when this enormous tax on the consumers, the people of the United States, has been levied by government authority and paid into the profits of private interests?

WHY is it that a bill which will pay money to the people can be sidetracked in Congress for bills which only take money from the people? The tariff is a tax on the people; the American people pay it, and to private corporations at that; yet the biggest tariff tax ever laid on Americans is now being prepared. The so-called "merchant marine measure" is only a subsidy attempt—taxing the people for money to hand out to men who cannot operate ships profitably. Ship operation ought to pay, as steel manufacture ought to; the American people should not be taxed by subsidies or tariffs to make up deficits. We need legislation to start something that will pay dividends to the people, not take more money away from them.

The ship subsidy is simply another tax on the people. Its supposed purpose is to create a merchant marine. We had a merchant marine once and it was not created by subsidies; it was created by the need for ships and by ability to operate a ship profitably. That is the only way a merchant marine can ever be established. The purely industrial or commercial enterprise that is worth anything at all can stand on its own feet. And what is more it will stand on its own feet if it is worth anything at all. A ship subsidy is not a solution of the ship problem. It is merely a postponement of it at great cost, and at private gain. The subsidy, like the tariff, aims at taking money from the people to give it to a class. In the case of the tariff it is taken from the people to give to a class of manufacturers who are not good enough manufacturers to compete with the not-so-good manufacturers of Europe. In the case of the subsidy it is taken from the people and given to a class of speculators who never will learn how to support themselves as long as they are assured of hand-outs from the public treasury.

The Bonus is another proposition. The human element enters so strongly that money sinks into secondary place, but the Bonus—even a Bonus with the kindliest intentions and the noblest spirit (which this proposed Bonus conspicuously lacks) is not what is needed. We promised those boys that we would stand by them, and we have not kept our promise; what is more, we cannot keep our promise by giving a Bonus. We owe them more than any Bonus—we owe them an established place and a first-class opportunity in life. That is what we owe them. And we could pay them, too, if we would only try for once to start something that would pay dividends to the people.

We wouldn't need to lie about "tariff for revenue"; we wouldn't need to propose deceptive subsidies; we wouldn't need to fall back on the beggarly insult of a Bonus if we would only for once use the legislative power to get things going. Then we should be able to laugh at tariffs; we should be able to give profitable business to all the ships at sea, and we should be able to keep our 1917 promises to the soldiers.

Let Congress give most attention to the bills that promise to start something in behalf of the people.

A volume of 346 pages, durably bound, containing 98 of these articles, under the title of "Ford Ideals," will be sent postpaid for $1.00.

The Mississippi Floods—A Permanent Peril

Mightiest River in 1922 Outdoes Former Assaults on Land It Built

Refugees lined up at Jackson Barracks' stables waiting for billets.

Three miles to go to safety and it's an all-day picnic.

This panoramic view of the flooded section below New Orleans was taken from a navigation tower in front of the village of Carnorvan, about one quarter mile below the crevasse. At the right of the building with the smokestack which is the plant of the Star Packing Company, is the Carnorvan canal leading southeast to Lake Lery. The flood extended beyond the canal which, however, acted as a natural spillway and checked the water for several days. The skiff in the foreground is on top of the Louisiana Southern Railroadtrack.

A typical mammy from the Poydras flood area of South Louisiana, with her two treasures and a world of scorn for Ol' Father Mississip'.

MISSISSIPPI River floods deposited the soils which have made Louisiana one of the most fertile spots on the globe. But each year the Mississippi rages down in a new flood, intent on destroying the rich products of the very land it has created.

Each new flood brings new soil deposits to build up more land and enrich posterity hundreds and thousands of years hence. But the prosperity of posterity is small comfort to thousands of Louisianians, driven forth from their homes with their crops destroyed and their future placed in hazard.

This year of 1922 has brought the highest water in the Lower Mississippi in the 200 years since the white settlers began the perpetual battle against the flood ravages.

"The great flood of 1922, the greatest flood in Mississippi River history," is the way this year's tremendous onslaught of the Father of Waters should be known to people who live on the lower river.

But, strangely enough, this superlative effort of the mightiest river has occasioned only the most casual interest, except in the territory most direfully affected. One reason for this lack of attention has been that the high waters this year have been attended with no loss of life directly attributable to the magnitude of the flood. After scores of years the battle of the levees seems finally to have turned in favor of man. In other great flood years, loss of life has accompanied vast property loss. This year, the strength of the artificial defenses against the swollen river, combined with heightened relief methods and a Federal and state warning system of high efficiency, has prevented loss of life.

Gradually, man is winning the battle of the levees. But the battle is not yet won, as witness 35,000 persons rendered homeless and millions of dollars' worth of property destroyed by breaks in Louisiana levees. The last previous so-called "great" flood, that of 1913, saw the destruction of property estimated at $43,000,000. This year's loss is not expected to be so large, despite the vastly increased property values.

Scores of crevasses in the levees were reported in previous floods. This year only five were recorded in Louisiana. In 1897, the Mississippi floods overflowed 13,580 square miles of territory. In 1903, the inundated land totaled 6,820 square miles despite higher water. This year's overflowed territory will total still less.

"But this has been due only to a most desperate fight," Governor John M. Parker, of Louisiana, told THE DEARBORN INDEPENDENT.

The governor has himself been a victim of the Mississippi overflows. His 10,000-acre plantation in Northern Louisiana was inundated during the 1913 flood, and he had a strenuous time saving his workmen and their families, while the waters were sweeping over his crops. He was, therefore, equipped by experience for the situation which faced him this year when he led in person the battle against the breaking of the levees.

The story of this year's fight against the flood is one of day and night work for weeks. Constant watchfulness was necessary all along the levees. Hourly tests were made to determine whether there were indications of the water seeping through the great earthworks which protect the land from the higher water in the river channel. Workmen kept steadily at the task of building the levees higher after it became apparent that this year's waters would exceed in height those of previous years and would overflow the tops of the levees. Where the crevasses actually did occur, it was a desperate struggle to remove the refugees to safety and a determined one to tie up the crevasses and reduce to a minimum the inundated territory.

The warning system was of incalculable assistance in enabling residents of threatened territory to escape ahead of the rising waters.

"We knew where every automobile was located," said Governor Parker. "Rockets and flares, the telephone, watchmen and messengers, were at hand to spread the news of a break in time for all residents to escape."

The first break in a levee had hardly occurred, when on April 27, Dr. I. M. Cline, United States weather forecaster at New Orleans, sent out a flood bulletin. As a testimonial to accuracy, his prophecy on the results which would flow from the crevasse is remarkable. The levee break occurred at 5:30 p. m., on Wednesday. The next day the bulletin sent through the territory said:

"The water from the crevasse in the right bank of the Mississippi above Ferriday will return to the Mississippi and Atchafalaya rivers through the Black, Lower Ouachita and Red rivers. . . . The water will overflow Concordia, Lower Tensas, Southern Franklin, Eastern and Southern Catahoula, and part of Avoyelles parishes."

That prediction was borne out. The territory overflowed from the Ferriday crevasse included several thousand acres of valuable land devoted to general agriculture.

The weather bureau made a similar prognostication in connection with the levee break at Poydras, 14 miles below New Orleans. This break occasioned an overflow which covered the valuable truck farms which do much toward the feeding of New Orleans. The break which occasioned the fear of the greatest property damage occurred about three weeks later at Hamburg. The Ferriday crevasse was just north of Natchez and about 200 miles from New Orleans. The Hamburg break was about 150 miles from New Orleans, and shortly above the great fertile territory in which are located 800,000 acres of cane sugar. The sugar plantations had been inundated in the flood of 10 years ago with vast damage. The Ferriday crevasse had widened into a break of a half mile in width within a short time, and the Hamburg break within 24 hours reached a width of 500 feet.

The Hamburg break, however, did not have the disastrous effects feared. Instead, it lowered the water of the streams flowing into the Mississippi and lessened the flood hazard. Another break at the state penitentiary farm at Angela did $1,500,000 in damage in a few hours, and caused the removal of the convicts who were put to work on the levees near Baton Rouge.

The relief agencies called upon because of the overflows were many. The state and Red Cross co-operated in the relief of families made homeless and concentrations of refugees were made at Jefferson Barracks in New Orleans and in Baton Rouge and elsewhere. The State Board of Conservation carried on an intensive effort to rescue the animals which became flood victims. Previous preparations had made the removal of the live stock merely a matter of execution of plans already made. But the rescue of wild animals was a different matter. Rabbits, muskrats, deer and other wild denizens of the forest were saved from starvation or drowning. It was a difficult task to induce these scary animals to accept human assistance, and the rescue work was not altogether successful. Deer fatally injured themselves in their timid misunderstanding of the attempts at rescue. Delegations of trappers from the Poydras district besieged the Board of Conservation, asking that the enforcement of the game laws be modified so they might save muskrats from starvation by shooting them first. The Board was fearful that this doubtful mercy might be taken advantage of for a general loosening of game law observance.

Louisiana residents resent the situation which makes them bear the brunt of the flood effects.

"Thirty-one states empty their flood waters through the Lower Mississippi," said Governor Parker. "Almost none of the waters which rise in Louisiana go through the Mississippi channel. Instead, they find their way to the gulf through the little rivers and streams which are independent of the great river.

"In 1882, President Arthur declared that he believed the disposition of the Mississippi flood waters was a great national problem. We agree with him."

The efforts of the states on the Lower Mississippi to get the national government to consider the flood problem a national one have been productive of some result, and for years this result had as its by-product the scores of little pork-barrel riders whereby insignificant streams through the country rode to appropriations from the national funds. Under the present flood control act, however, the pork-barrel feature seems eliminated.

The flood control act provides for an expenditure by the national government of $45,000,000, with a permissible expenditure of $10,000,000 a year, provided the states and levee districts co-operating in the improvement, extension and maintenance of the levees, spend one dollar for every two dollars spent by the Federal Government.

The Federal Government has long recognized the Mississippi problem as a national one but the active demonstration of this recognition has not been so strong as the states most affected would have it. The Mississippi River Commission, organized in 1879, took charge of the levee work. Co-operating with the states and levee districts it undertook the work of standardizing the levees and extending them. But the recognition of the Federal responsibility is even now not clear.

Since 1879, a total of $123,000,000 has been spent

in new levees, repairs to old ones, revetments and other Mississippi River protections. There are now 1,774 miles of levees, protecting a territory of 27,303 square miles. At the close of the last year, the Mississippi River Commission reported the levee work as 66 5/10 per cent complete. It would take $30,000,000 to complete the levee work. In view of the fact that a single year's flood might easily cause a loss of that amount of property, the failure to complete the work at once is puzzling.

"When the levee construction work is completed, what will become of the commission?" Colonel Charles L. Potter, a veteran in Mississippi River protective measures, was asked.

"The act provides that the work of maintenance be turned over to the levee districts," he replied.

Colonel Potter thinks, however, that before that time comes the Federal Government will provide some regulative and supervisory control over the levee situation. The tremendous peril which the negligence of a single levee district might afford to the entire country is patent.

The importance of Federal supervision of the levee work is not measurable. The standardizing of the great banks of earth, which have been in the building since the earliest days of the French settlement, has been one of the important tasks toward which government and state engineers have bent their thoughts. Colonel Potter believes that the Ferriday crevasse this year may be traced to the decay below the actual levee of old stumps or foundation matter which date from before the Civil War, rather than to any fault of the levee itself.

That the flood problem is a permanent ailment which may be alleviated but never cured is due to this fact that the bank underneath the levees must always present opportunity for the river to undermine when it may not overflow them. The collapse of the river banks when the water falls is a graver peril than the overflow possibility at the time when the rise of the water reaches its highest point.

Engineering authorities, with exceptions, have agreed that the levee is the best protection under feasible conditions against the Mississippi floods. To mitigate the floods in Lower Louisiana, some engineers have suggested the diverting of the Mississippi through the channel of the Atchafalaya, a small river, to the Gulf of Mexico, a route which would shorten the waterway by 150 miles. This suggestion has received little favor and probably never will be accorded a hearing, due to the fact that the moving of the Mississippi would mean the probable passing of the famous old city of New Orleans. Most of the engineers believed that the Mississippi might be diverted from its present course, but most of them also believe that the appreciable lessening of the current in the present channel would result in the filling of the deltas of the Mississippi, so that New Orleans as a seaport would pass.

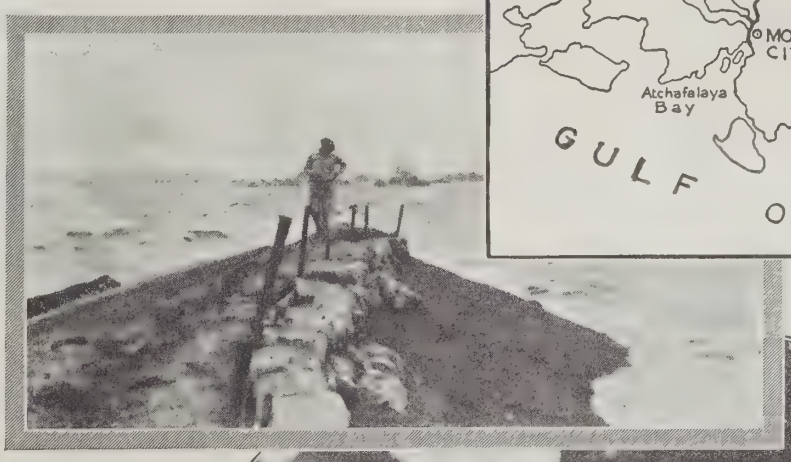
"If it were possible to build enough reservoirs and have them at the right place at the right time, the Mississippi flood situation could be handled by them," said Colonel Potter. "But on one river in Ohio there was spent $38,000,000 for flood control in a basin of 3,200 square miles. In the Mississippi basin of 1,200,000 square miles, the cost of the reservoir solution can be imagined."

Heavy rains, just plain rains, are the causes of the floods of the Mississippi. The upper tributaries of the Missouri, the Ohio, the Red and other smaller rivers join with the waters of the Upper Mississippi to produce the high water which does its greatest damage in the territory nearest the Gulf. The history of former floods has been that the Ohio River, with its branches, was the first to go on a rampage, and news dispatches as early as late February frequently carry accounts of flooded cities in Pennsylvania, Ohio and Kentucky. This flood water forcing its way down, is joined somewhat later by the product of the spring thaws from the Upper Mississippi Valley. This year, however, the Ohio was more placid than usual, and it was the Upper Mississippi which began the trouble. And it was the extraordinarily large contributions of water from the Red, St. Francis and other branches of the Lower Mississippi which produced the record-breaking high water in Louisiana.

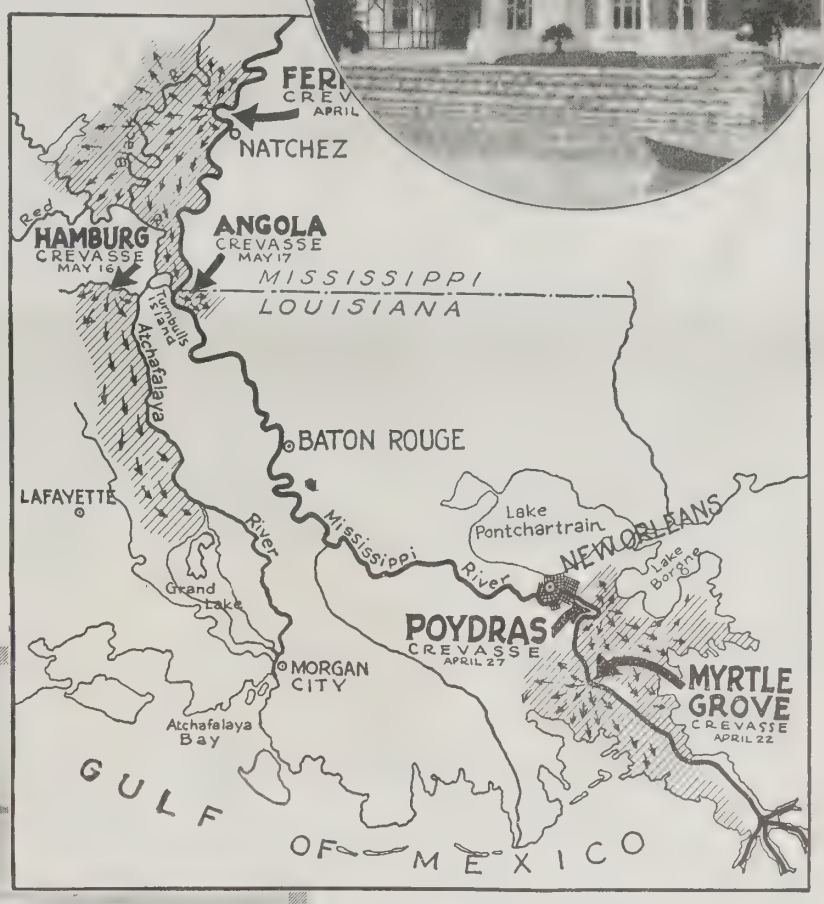
Viewed from the standpoint of the upper portions of the Mississippi Valley, the 1922 flood was not particularly violent. But the water gauges on the lower river showed the highest water in history.

At New Orleans this year the water gauge showed a high mark of 22.7 which means the high flood point was that many feet above the mark adopted years ago as the low water level. Farther up toward St. Louis the gauge sometimes reads 55 feet. The differences in the height of the natural bank cut by the river accounts for this difference in gauge. And all the way from Cairo, Illinois, to the Gulf, the height of the actual levee is practically constant. The New Orleans mark this year was seven-tenths of a foot higher than the previous high record in 1912, which in turn exceeded previous high marks.

Floods on the Mississippi have been troublesome from the earliest days. French residents still surviving in St. Louis in the middle of the last century used to relate stories of the flood of 1785, "l'annee des grandes eaux," the year of the great waters. Early traditions of Louisiana go even farther back. In 1904, John M. Parker, now governor, compiled for the benefit of his personal friend, President Roosevelt, a record of flood and levees which takes the battle against the high waters back to 1717. In that year De La Tour, the engineer who laid out New Orleans, directed that a "dyke or levee be raised in front, the more effectually to preserve the city from overflow." Ten years later, Governor Perrier announced that the New Orleans levee had been completed. It was then 5,400 feet in length and 18 feet wide at the top.



One hundred years later, after development by private enterprise with colonial and later state assistance, the levees extended from New Orleans to the Red River. In September, 1850, Governor Parker's record shows that the Federal act permitting the sale of swamp land for the raising of funds for levee work gave a great impulse to levee building. There was at first no concert in action, though Louisiana, Mississippi, Arkansas and Missouri appointed commissioners and took steps toward levee construction. Since the inception of levee building, most of the work has been by individual work or state effort, though the levees constructed under the supervision of United States engineers have shown the greatest strength.



There is no method ascertaining the total cost of the levee in the 200 years of construction. Federal figures of cost since the organization of the Mississippi River Commission are known, and state costs can be closely approximated. But the levee districts, some of which were the product of wildcat bond ideas, spent a total which never will be known accurately.

At present the levee districts are fairly well organized. The states in which they are located grant the districts a modified taxation power over crops and land in the district subject to overflow. In Louisiana, the annual expenditure for levee work is approximately $2,000,000. In view of the 7,000,000-pound sugar crop, the wisdom of high expenditures for protection from flood peril is clear.

The Mississippi River was once looked upon as the avenue destined to afford the great outlet for the industry and farm products of the Middle West which were to be exported to the great ports of the world. Since the development of the railroad, the river has declined in importance as a commerce carrier. The accident of settlement and seeming auspiciousness of location at the mouth of the greatest river made New Orleans a great seaport.

Now it has become a real question whether the Mississippi can be looked upon *in Louisiana* as a present asset or as a liability. The river is responsible for much of the alluvial richness of the soil, but it is responsible, too, for the costly battle necessary to save that same soil and make its wealth available. *The rest of the country* has the river as an undivided asset.

Circle—At St. Bernard courthouse, in the path of the Poydras crevasse, court routine is carried on by men who come in pirogues. The map shows where the levee break occurred.

Above—Looking north from the 2,000-foot break in the levee at Ferriday, Louisiana. Five minutes after this picture was taken the spot where the photographer had stood flipped off into the rushing flood. What was the land side is to the left of the picture. Below—Sick "Aunties" get their "miseries" treated by a Red Cross nurse at the refugee camp at Natchez, Mississippi.

The first picture of the first crevasse. This photograph was taken by a photographer who reached the scene by fast automobile from New Orleans a short time after the first break occurred this year in the Mississippi levee system. The crevasse was at Myrtle Grove plantation, about 20 miles south of New Orleans on the west bank of the river. The water swept inland about 10 miles and was carried to the Gulf by a network of bayous.

Canada Meets the Human Wave From Europe

Inside Facts of a Critical Situation, New to Canadians, Are Told by a Dominion Journalist; Officials Attacked for Enforcing the Law

By HECTOR CHARLESWORTH

IF YOU ask any thoughtful Canadian public man what is the most important problem that faces Canada today, he will tell you that it is population which, in the case of a young country with vast, sparsely-settled areas, is radically entwined with immigration. The financial problem, created by the country's immense war indebtedness, and the transportation problem, arising from its vast accumulation of unremunerative railroad mileage, are, of course, more immediate. But for the solution of both, measures to increase population by a rational and effective immigration policy are absolutely essential. In all the chief centers of Canada, immigration is becoming more and more a subject of popular discussion. The few public men actually in a position to give information and advice on the subject are widely in demand as speakers before those social and educational organizations which are so marked a feature of Canadian civic life. The course to be adopted on the population question by the new Liberal administration is a matter of eager discussion everywhere.

Undoubtedly Canada by opening wide its doors could obtain in a comparatively brief space of time a vast population of the kind it does not want; in fact, it is almost as much embarrassed as is the United States with this particular phase of the immigration problem. But the grave question is, how shall Canada get the kind of settlers it really does want? Settlers of the wealth-producing rather than the parasitic class.

The results of the decennial census of 1921 illustrate several phases of the population problem. The exact figures have not been given, since the bulletins of population are being issued province by province, and the tables with regard to some of the larger ones have not been completed; but it is known that the totals showed a population of a little less than 9,000,000 inhabitants on May 31, 1921, as compared with 7,206,643 on the same date in 1911. This would be a respectable increase, all things considered, if it were not for the immigration figures of the decade in question. Immigration from 1911 to 1921 amounted to 1,975,398; and taking into account the normal increase in population through natural causes, it is estimated that Canada should today have a population of something more than 11,000,000 instead of less than 9,000,000.

Making every allowance for the retarding of natural increase as a result of war, it is quite clear that more than half the immigrants who came to Canada in that period must have gone elsewhere. It is not difficult to answer the question where they went. It is fairly plain that the United States absorbed them in addition to the quota of native-born Canadians which is constantly drifting southward.

Of approximately 2,000,000 immigrants who came to Canada between June 1, 1911 and the same date in 1921, the major portion arrived in the first three years of that period. The 10 years prior to 1914 were very fruitful in bringing to Canadian soil and especially to the prairie provinces the settler of the type the country most covets. Of 2,500,000 who entered Canada during that period, 1,000,000 were from the United States, chiefly the Middle West—homesteaders with capital, experienced in starting the machinery of production. One million more came from the British Isles and were also for the most part of the desirable order which goes on the land. The balance came from Eastern Europe and they too proved a boon in assisting in carrying out the heavy work of western development. *What Canada needs most today is a resumption of the old flow of real developers.* The fact that worries the government and its officials is that the voluntary increase is offered from sources which do not augur well for Canadian development. Thus the Department of Immigration, while zealous to build up Canada's population, finds itself busier than it has ever been in its history in trying to shut the door. It is obliged to adopt rules and practice a system of surveillance which may possibly tend to discourage or exclude some settlers who might make good.

Don't Want Them Back

THE countries which give Canada the most worry in the matter of sending to her ports immigrants of the type she does not want are Poland, Russia and Rumania; and the spout from which they largely come is Poland. The situation is in some degree affected by the drastic regulations with regard to immigration that have been adopted by the United States. In the opinion of Canadian experts these, especially the debated percentage clause, are the best that have yet been devised for the purpose of checking a class of inflow that is not desired; but they have naturally increased the difficulties of Canadian officialdom. The European undesirable who wants to come to America is pretty generally aware that the task of getting into the United States is hopeless, and so he directs his energies toward getting into Canada. No doubt he hopes that one day he will be able to pass over the border into the fabled land of wealth that lies south of the Canadian boundary. Notwithstanding the additional inconveniences involved, Canada approves and welcomes the American immigration regulations; they are in a sense a protection to her against the loss of population as shown in the figures given above; and they give a warrant for policies which it may yet be necessary to apply in their own country.

The influx of undesired immigrants from Poland last year became so serious that in the early autumn the Canadian Government decided to send Dr. Black, the deputy minister of immigration and colonization, to Warsaw to see what could be done about it. In all the negotiations with the British authorities and with Polish officialdom, which were necessary in connection with this mission, the name of Jew or Hebrew was never once mentioned, but the rumor was spread abroad in Europe that Canada's policy was anti-Semitic. It was only so in the sense that the majority of the undesired immigrants, knocking at Canada's doors, are Hebraic; and they are deemed undesirable not because of their race, but because they come to swell the numbers of civic communities already overpopulated, instead of going upon the land.

Last summer Canadian cities were face to face with an unemployment situation which has not yet been entirely mitigated. During the open months when immigration from Europe flows most freely, between 8,000 and 9,000 Hebrews of Polish, Russian or Rumanian origin obtained admission to Canada's ports as immigrants. The number is not great but it was known that many thousands more were eager to come if they could obtain admission. It was but the vanguard of a new invasion, so to speak. Even 8,000 added to the populations of Toronto and Montreal, where thousands of unemployed were walking the streets, was an economic fact of sufficient seriousness to demand attention; for the newcomers made such cities their objective, and could not be regarded as potential wealth producers. Consequently, it was decided to make direct representations to the Polish Government, and this course was assented to by the British Government.

How Countries Give Trouble

THERE was good reason to believe that Poland was engaged in encouraging the export to American and Canadian ports not only of her own Jewish population but of visitors from the Ukraine and other parts of Russia. Certain of the newcomers bore passports containing the phrase, "Citoyen Polonaise"; but in other passports precisely similar in appearance the certificate of citizenship was omitted. It has been learned that in some instances a condition of the issuance of passports to Canada was a signed undertaking never to return.

The desire of Russian Hebrews to get to Canada is based on different grounds than that of the Polish Jews. They have nothing to complain of in a political sense. According to information in the possession of the Canadian authorities last October, 442 of the 470 members of Lenin's council as constituted at that time were Jewish, and a great many of the district commissars were of that race. The Russian Jew desires to come to Canada because of the economic conditions prevailing in Russia. He is not as a rule a wealth producer, but an auxiliary. Since the production of wealth has largely ceased under Bolshevist rule, the Jewish populace finds itself sorely hit. The Russian peasant produces for himself and limits his production largely to his own immediate needs; and there is no surplus to form a field for Hebraic activities. Up to the present there has been no recognition of Russia's Bolshevist government, which would make its passports valid in the eyes of a Canadian port official. The Russian Jew meets this situation by going into Poland and purchasing a passport there.

The three most important regulations devised by Canada to control immigration are: 1. Continuous voyage; the immigrant must show that he has come direct from the country where his passport was issued and has not stayed over in other lands, except by the exigencies of travel. This, for instance, prevents undesired Greek immigration, for only occasionally does a steamer sail from Greek ports direct to Canada. 2. A certificate of citizenship signed by a British consular agent showing that the immigrant is a citizen of the country from which he sails. It has been shown that the precisely similar appearance of Polish passports, some of which omitted the citizenship certificate and some of which contained it, led to many evasions. Now all passports are viséed at Antwerp where every immigrant ship must call and greater precautions are exercised. 3. The immigrant must have cash to the value, in Canadian currency, of $250. This proviso is almost inoperative and a dead letter. Port officials allege that by a little legerdemain $500 can be made to serve for a large group of immigrants, who pass the money around on an endless chain system. Only by a very strict and necessarily costly system of surveillance can this regulation be fully carried out. It has long been a standing joke among the officials of transatlantic steamship companies. The trickiness of the newcomers from Eastern Europe is one of the constant annoyances from which immigration inspectors suffer. Immigrants from the British Isles and Scandinavia are straightforward and often make admissions of poverty that officials would like to wink at; but the immigrant of the type described seems to be educated in every evasive trick before he sails.

Representations which the Canadian emissary, Dr. Black, was instructed to make to Poland, were to the effect that Canada had it quite within her power, irrespective of Great Britain, to debar immigration from that country; and that it would do so if Poland did not confine the issuance of passports to her own citizens exclusively. *Since then a change of government has taken place in Canada, and one of the unpleasant consequences is a concerted effort to secure the dismissal of all Canadian immigration officials of the old government who tried to put a check on indiscriminate immigration. It is financed by wealthy and influential Hebrews. Other pretexts are trumped up as grounds and the name of Jew is never mentioned; but the source of the agitation against certain officials is well known.*

Even the average well-informed Canadian is quite unaware of what has been going on behind the scenes to promote a large influx of undesirable types to Canada. There exists a strong organization headed by S. W. Jacobs, K. C., of Montreal, an eminent lawyer, a prominent Liberal member of the House of Commons where his party is at present dominant, and a man of genuinely philanthropic instincts who was a close friend of the late Sir Wilfred Laurier and who also enjoys cordial relations with the present Prime Minister, Rt. Hon. William Lyon Mackenzie King. The writer is acquainted with highly cultured Hebrews who are strongly opposed to swelling the numbers of indigent or nearly indigent Jews in Canadian cities and who condemn Mr. Jacobs' methods. Within the present century the Hebrew community has grown from negligible quantities to at least 70,000 in Montreal and about 45,000 in Toronto. As yet it has attained to little or no public influence, because the sinews of finance are firmly held in the hands of Scottish-Canadians; and in politics British and French-Canadians hold the reins, and are jealous of their prerogative. It is the dream of Mr. Jacobs and certain men of his race so to augment the Jewish population that it will become a real political power in Canada; and gain a title to representation in the federal government. Canadian prime ministers still largely adhere to the system of choosing their cabinet colleagues in accordance with the sectional strength they can bring to the support of an administration; and it is argued that if it can but make itself strong enough numerically, the Hebrew population can obtain an influential voice in political affairs—federal, provincial and municipal—that is at present denied them. The type of educated Hebrew to whom I have alluded objects to this policy on the ground that the demand for political influence is undesirable from several points of view.

In no case where a Hebrew immigrant has been rejected, on whatever grounds, has there been failure to appeal. No matter how definitely the immigrant may come under the category of an undesirable, financial assistance is forthcoming to carry the appeal up to the higher powers at Ottawa. Often the best legal talent of a non-Jewish character is employed to secure the admission of a wanderer from Eastern Europe. There is a definite effort to compel existing rules relating to immigration and which are fairly applied to all, Britishers as well as Poles and Russians, to be suspended in the case of Hebrew immigrants.

"Favored Nation" Act?

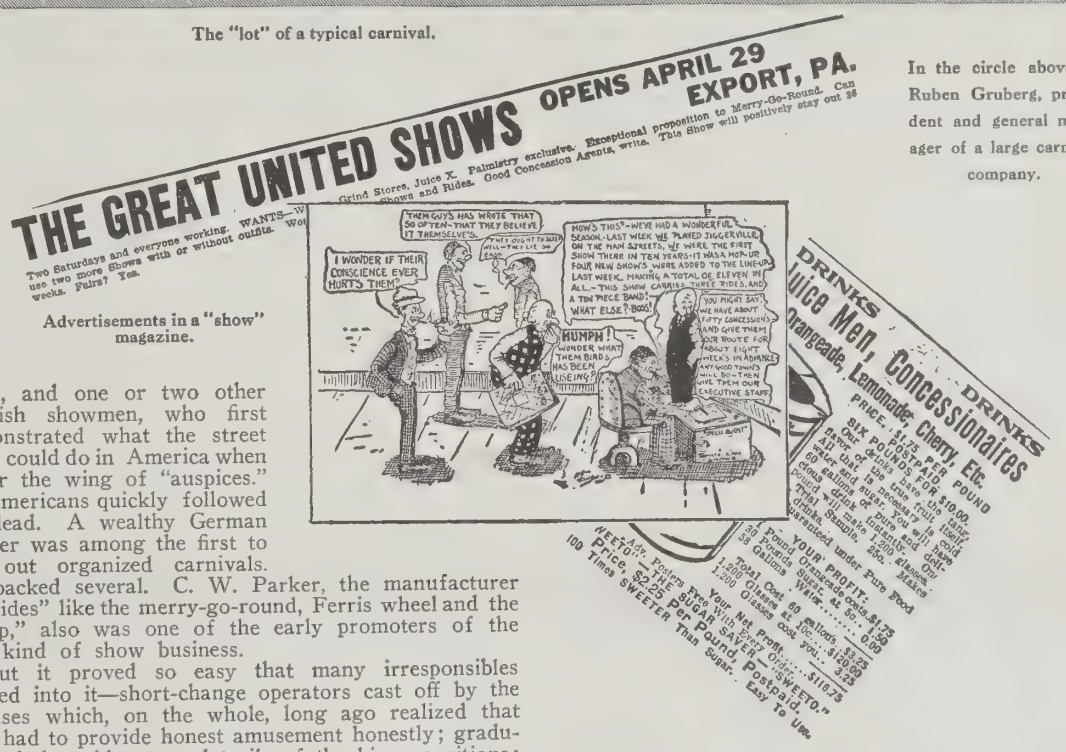
I HAVE dwelt on this phase of Canada's immigration question at considerable length, because it has tended to produce deadlock in connection with the whole matter. In enforcing regulations to keep out the hordes from Russia and Poland that are only too anxious to come in and whose friends in Canada are bound to help them in; it is necessary to erect barriers which tend to exclude settlers from other countries which this country would be glad to welcome. Colonel J. S. Dennis, head of the colonization department of the Canadian Pacific Railroad, which has large holdings of vacant land in the West, complains of the "continuous voyage" clause, on the ground that it is keeping out many decent British immigrants who have entered the United States and would like to come to Canada. He also says the severity of Canadian regulations is frightening away large numbers of desirable settlers, who are poverty-stricken but could be made real wealth producers. Sir Clifford Sifton, formerly Minister of the Interior for Canada, who initiated the policies which brought 2,000,000 people into the Canadian West early in this century, is actively campaigning for agricultural immigration from Hungary, rural Poland and other agrarian sections of Europe.

The only solution seems to be in a "most favored nation" treatment; and in the clear classification of immigrants as far as is possible. Most Canadian experts advocate favored treatment for British immigrants and bona fide Americans of the immigrating class. Immigrants from other nations would be classified according to their status at home; the preference being given almost exclusively to those of agricultural experience. There is also a strong movement in favor of guiding the courses of the agricultural immigrant after admission, that he may not be cheated or become the victim of his own ignorance of Canadian farming methods. Enlightened officials favor the blacklisting of lands unsuitable for settlement so that the newcomer may be sure of a fair deal. Out of the present deadlock, it is hoped that some sane and liberal policy will be developed which will give Canada the population she needs *where she needs it,* and not add to the present evil of congested city populations.

The Carnival Merry-go-round

Scores of "Shows" Form an Immense Business

By ROBERT KENTON



This is the second of two articles on the influence of the carnival.

In the circle above is Ruben Gruberg, president and general manager of a large carnival company.

The "lot" of a typical carnival.

Advertisements in a "show" magazine.

show, and one or two other English showmen, who first demonstrated what the street show could do in America when under the wing of "auspices."

Americans quickly followed the lead. A wealthy German brewer was among the first to put out organized carnivals. He backed several. C. W. Parker, the manufacturer of "rides" like the merry-go-round, Ferris wheel and the "whip," also was one of the early promoters of the new kind of show business.

But it proved so easy that many irresponsibles drifted into it—short-change operators cast off by the circuses which, on the whole, long ago realized that they had to provide honest amusement honestly; graduates of the midways and trails of the big expositions; successful amusement park and fair ground concessionaires. A few hundred dollars was sufficient to organize a "carnival show" of the small-town caliber. The writer is assured by one who should know that a man with nerve and executive ability can now organize and begin the operation of a carnival company without investing a single dollar, except what he spends for advertising the sale of concessions.

For it is not the "shows" nor the "rides" that are the core of 95 per cent of those companies; the core is the concession, for which all else is mere excuse and camouflage.

The carnival show, to illustrate, includes three principal types of amusement. One is the "side shows" of the kind, though not often so good, that operate in connection with the big circuses. The second is the "rides," like the "whip," the Ferris wheel, and the merry-go-round, the last being, despite the novelty of the ones of more recent invention, still the stand-by and the most dependable money-maker. The third and most important of all is the concessions. Generally, the owner of the organization owns the "rides" and at least some of the shows. Often, however, both rides and shows are owned by individuals who operate as concessionaires or priviligees. The first pay lump sums and the other a percentage of receipts for operating rights.

The "rides" invariably are profitable and equally above suspicion. They supply innocent amusement, usually at reasonable cost. One carnival-show operator had the midway at a Canadian fair a year or two ago. The fair authorities asked him to put in a couple of extra "rides." He bought them at a cost of nearly $100,000. Before he moved them from their first location they had repaid the investment.

The "shows" are less certainly profitable—generally they don't deserve to be, for the bulk of them are essentially frauds. A few operators, however, keep the "shows" to the front and thereby provide fairly good ones. Generally speaking they are mere novelties—a half-dozen performances, during a single afternoon or night, by each show is not unusual. Recently, the writer visited most of the shows at an alleged worthwhile "carnival." Few performances lasted more than 10 minutes and none more than a quarter of an hour.

About the only protests that have gone up against carnival outfits have been on the score of the "shows." These protests have been aimed at the immoral and in some cases the depraved features of some of the exhibitions.

At one time "hootchie-kootchie" dancing, a cheap and vulgar imitation of oriental contortions, was a leading feature among the shows of virtually every carnival outfit. The introduction among the public of the "turkey trot," the "bunny hug" and other jazz dances together with the declining conservatism in the dress of many women tended to sap the "kootch" show of its thrills. It ceased to pull as it did when first intro-

Carnival concessions that prove money-winners.

Price Paid Has Naught to Do With His Value

Story of How Dollar Mark Has Overshadowed Romance in Baseball

By a Veteran Sports Writer

IN 1905, the Detroit Tigers were training at Augusta, Georgia. Frank J. Navin, who used to be a bookkeeper for the club and who had obtained enough financial backing to buy an interest, was starting his career as a major league magnate and in that capacity Navin decided to visit his team's training quarters at Augusta.

The late Herman Schaefer, then in his prime as second baseman for the Detroit team, met Navin in the hotel lobby when he arrived in Augusta.

"Say, I got a big laugh for you here," said Schaefer to Navin. "I'm going to show you something tomorrow that'll make you laugh your head off, the funniest thing I ever seen."

"What's the laugh about?" asked Navin, and Schaefer explained:

"They got a crazy kid on this Augusta ball team. He thinks he's a ball player and he does the craziest things you ever saw anybody do. Just wait till you see him!"

"Just what does he do?"

"Why, this simp tried to take two bases on a single and he cuts around first base and breaks loose with all kinds of nut stuff. Wait till you see him run bases! You'll laugh your head off. But don't laugh while he's around because he might get wise to what you're laughin' about and that would queer the best show I have had. They want to keep him around here to amuse people."

Navin saw the "crazy kid" the next day and saw him several days after that. He bought him at the end of the season for $750. Everybody thought Navin was crazy but after they watched the "lunatic" for several years they all thought Navin lucky, for the "nut," as you may have guessed, was Tyrus Raymond Cobb. None other.

The case of Cobb is remarkable but not exceptional. Three of the greatest players in history came into the major leagues for the same price, $750. The other two I have in mind are Grover Cleveland Alexander and Hal Chase. Others were bought for less and some cost but little more. There have been few good ball players who were fixed stars when they entered the major circle. There are fewer who jumped into fame suddenly. Nearly every player of note, whose career stretches over five years or more, came up gradually, and practically all were cast out as useless, not only once but several times, before they succeeded in finding a place.

The "greats" of baseball come up slowly. They ease their way into the major circle gradually. They do not arrive with the blare of trumpets, figuratively speaking, and they do not come heralded with three sheets and many columns of newspaper publicity and half-tone art.

In recent years we have lost much of the color in baseball. I have heard veteran writers, managers, owners and patrons of the sport complain that "there is no more color in baseball." They mean, in other words, that romance has filtered out and that it has become a hard and cold business proposition. Color and romance as applied to baseball are synonymous.

But, the color and romance remain. Romance has not left baseball. There is as much romance as ever but it has been overshadowed temporarily by the dollar mark. Some major league owners believe that huge figures make good publicity. Baseball patrons are expected to get an astounding thrill out of astounding prices paid for players and flock to the parks to see these new "phenoms."

Dollar First Poor Publicity

IN THIS belief the owners are wrong. The stunt is old. A great editor was asked what three subjects furnished the best newspaper reading matter and his ready response was, "mystery, dollars and pretty women." But that was 20 years ago and the dollars trick has been seriously overworked in the amusement line.

Putting the dollar before the man is poor publicity. People are interested in people and what people do. The dollar sign carried no color and no romance. Although it has been shoved to the pinnacle in baseball publicity it has not succeeded in smothering romance but merely in hiding it. The romance is still in baseball.

The dollar mark has played an insignificant part in the making of the "greats" of baseball. Most of them were buffeted about before their value was recognized.

Several years ago a young outfielder was playing in the Texas League. Many major league scouts had seen this young man with several hundred others but he impressed none of them.

John I. Taylor, wealthy sportsman, owned the Boston American League franchise at that time. He bought a large number of players. A friend told him to get this young outfielder and he got him for practically nothing. Had he been asked a hundred dollars more he would never have considered the player. The next spring Taylor happened to come across the name of this outfielder in the Texas League. He had investigated him and discovered nothing to warrant giving him a trial. Taylor decided he was out the few hundred he had spent in purchasing the player but concluded to make the best of a bad bargain by not having him report in spring camp, thus saving railroad fare and board.

"Mike" Finn was managing the Little Rock, Arkansas, club at the time and he needed an outfielder. Taylor wrote him he could have one of his recruits and told Finn to take on this young chap in the Texas League. Finn reluctantly took him but after seeing him work out a few times decided Taylor had not done him a good turn by handing him the recruit. However, Finn needed an outfielder and he had to keep the man. A year or so later he let Boston have him for $500. The outfielder is still in the American League. He is the greatest fielding outfielder the league has produced and he is one of the best managers in the history of baseball, is Tris Speaker, of Cleveland. That's who the young outfielder was. In justice to Finn it must be said that he realized Speaker's possibilities a few months after he had him and might have sold him for a big price in another year or so but he turned him over to Boston for $500 because he considered him Boston property. Taylor really had no legal claim on Speaker.

The history of Connie Mack's ascendancy in the managerial ranks always carried a certain fascination for the baseball follower. Mack was a wizard in taking college and minor league material and whipping these players into major leaguers.

Eddie Collins was a college baseball player who performed at times under the name of Murphy. He played for Columbia, and Mack signed him up for practically nothing. He kept him on the bench for a few years and after these "school days" Collins broke into the regular lineup.

Take the case of J. Franklin Baker: Mack signed Baker when the infielder was 26 years of age, and after an extended career in the minor leagues. Few managers care to sign ball players at the age of 26 and no other manager in the major leagues wanted Baker. He was a butcher in Trappe, Maryland, between seasons and he performed in the Tri-State League while the minors were in operation. All players in the Tri-State had been looked over and the scouts' reports on Baker apparently agreed. They read something like this: "Awkward fielder. Poor batsman. Age 26." No owner would sign a player with this report before him but Mack did and Baker, the man who "couldn't hit," was nicknamed the "Home Run King" a few years later.

The tall tactician's (slang for Connie Mack) experience with Joe Jackson was peculiar. One of Mack's scouts discovered Jackson in the wilds of the Carolinas. He was fast, a free hitter and a good prospect. Mack's scout thought he was. Other scouts did not agree. Detroit, for instance, had a tip on Jackson. Fred Payne, who caught for the Detroit team that won the American League championships, was scouting for the club at the time and Payne was sent into Carolina to look Jackson over. He reported: "Jackson is crazy."

Mack brought Jackson to Philadelphia. Jackson did not like it. He wanted to play in his stocking feet as he had done "back home." Mack would not let him do that and Joe became grieved. Then he told Mack he did not want to play in Philadelphia as there were too many physical discomfitures. Mack wanted to know what they were and Joe explained that the buildings were too high. The buildings, it seemed, shut off the wind, in Jackson's opinion, and he could not breathe. He went back home.

Jackson played in the South Atlantic League and finally landed with New Orleans. Jim McGuire, managing the Cleveland club, saw Jackson play down in New Orleans and liked him. He finally got him, handing Connie Mack several veterans whom Mack preferred to the erratic Jackson.

Some years ago there was a pitcher performing in Galesburg, Illinois. He was tipped off to the Indianapolis American Association club. Indianapolis signed him. Before he left Galesburg he was hit in the head with a ball one afternoon and his eyesight was affected by the blow.

When the pitcher reported to Indianapolis he did not have control. When he looked toward the plate he always saw two batsmen, two catchers. He never knew which one to throw to. His control did not improve and Indianapolis let Syracuse have the pitcher for a few hundred dollars. After one season at Syracuse, Indianapolis did not think enough of him to recall him and later on the pitcher was bought by the Philadelphia Nationals for $750. After he pitched for several months the National League began to realize that a new star had appeared. Such he proved to be season after season. And, the peculiar thing about Grover Cleveland Alexander was that he had almost perfect control. He never used anything but a fast ball, a curve and control and Indianapolis decided, early in his career, that he would never do in organized baseball because he lacked control.

How Wagner Was Obtained

GEORGE TWEEDY STALLINGS knew about a ball player in the West, a player named Wagner. He was a star in his section of the country. Stallings tried to get him but failed. Wagner was a lazy sort and did not care for the strenuous job of pastiming. Wagner would sooner be a ticket taker at the rate of $2 a day than a ball player for $10 a day. Stallings was disappointed because he could not land Wagner but someone told him that Wagner had a brother who was playing on Ed. Barrows' Patterson, New Jersey, club.

Stallings went to Patterson to look over this brother of Wagner's. He happened to be playing the outfield that Sunday. "He looks like a gorilla," said Stallings, "not like a ball player. He's the clumsiest thing in humans I ever looked at." Wagner hit two balls hard that day and he got everything in center field but he looked as if he had all baseball luck imaginable with him on every fielding chance. Stallings passed him cold. Other scouts also passed him but Pittsburgh finally took him on and John Honus Wagner became one of the greatest of all time.

It so happened that on the day Stallings looked over Wagner, Harry Clay Pulliam, Patsy Donovan and Ed. Hanlon were in Patterson scouting for players. None of them liked Wagner but they all liked Hendricks, another outfielder. Stallings had first call on Wagner but he passed that up and took Hendricks in preference. Then he discovered that Hendricks belonged to Cleveland and he got nobody.

But there were others that Stallings picked. He bought Elmer Flick, an outfielder, and Wiley Piatt, a pitcher, for $200 each. They became two of the best in the game. Piatt was one of the characters of his day, the kind that ball players describe as "100 per cent left-handers." When Piatt reported to Philadelphia he entered the clubhouse carrying a "turkey." On the sides in huge letters were the words, "Wiley Piatt, Ball Player." He wore a high top hat and long black coat. Coat and trousers were both much too small for him. The trousers did not reach his shoe tops and the coat sleeves ended three inches below the elbows. Probably no minor leaguer ever carried the same outlandish make-up into the majors that Piatt did. He was a "mark" immediately and the gang took him in hand. Piatt was smothered beneath the joshing until he got into the box and then he had the merry jesters "handcuffed." They had never seen such dazzling speed from a left-hander as Piatt uncorked.

Lajoie "Most Graceful Player"

STALLINGS is also the man who brought Napoleon Lajoie into the major leagues, but for this he deserves no particular credit. Lajoie, says Stallings, was "the most graceful ball player I ever looked at." Wagner was the most awkward. Wagner could be passed up reasonably but it would be difficult to overlook the smooth-working Frenchman. Stallings liked him so well that he paid $1,500 for him and Lajoie, on his first appearance at bat in the major leagues, hit the first ball pitched to him over the center field fence.

Before entering organized baseball (Stallings got him from the Fall River club) Lajoie earned his livelihood by driving a cab in Woonsocket, Rhode Island. He drove the cab at night and he played ball in the afternoon. He made a bare living by holding the reins at night and made nothing by holding a bat in the afternoon.

Lajoie loved the cabby seat and the fascination of driving never left him. After he entered baseball he always made friends with the cabbies and he frequently induced them to take him on errands, permitting him to drive.

In St. Louis, the players were always driven to the park in a big van. It was always the same van driven by a veteran cabby, who owned four fine horses. The St. Louis series was always a matter of keen anticipation with Lajoie and daily he would spend some time

(Concluded on page 12)

WAGNER AND COBB COST LITTLE

RECENTLY, the Chicago American baseball management paid a reported price of $100,000 for Willie Kamm, third baseman of the San Francisco club. Chicago will also turn over two ball players, estimated to be worth $25,000 to any club in organized baseball.

Hans Wagner was undoubtedly the greatest player of all time in the National League just as Tyrus Cobb is the greatest that ever played in the American League.

When Wagner reported down in Ohio for his first engagement as a ball player he carried all his earthly belongings with him. These consisted of the clothes he wore and a baseball suit, wrapped in a newspaper.

Wagner had a baseball outfit that lacked shoes. There was only one extra pair of shoes in the clubhouse and he was given these. They were too small. Wagner, playing the outfield, wore them for three innings and then took them off because his feet hurt too much. He played in his stockings.

The raw recruit wanted to become an infielder. He went to the park early each morning and got boys to hit him grounders. Wagner discovered that it was hard work trying to field grounders in his stocking feet because he could not "grip" the ground, so he dug holes on the infield and stood in the holes. This enabled him to start fast after a ground-hit ball.

In the afternoon when the regular infielders appeared they found the infield dug up. They could not understand this until one morning on arriving at the park saw Wagner at practice. A collection was taken up and they bought Wagner a pair of shoes to save the infield.

The Small-town Carnival and Its Evils

Concluded from page 9

duced and because it sometimes was used for purposes worse than vulgar public opinion in many places proscribed it.

Then the "Forty-nine show" came into existence. At first it was only a crude attempt at the spectacularity which the "carnival show" ever aims at attaining. It was patterned after the dance halls in the mining camps of California in the days when Bret Harte was absorbing material for his stories. It quickly degenerated, however, in many cases, into an atrocious rendezvous of vice of the worst and most demoralizing types. It is now not frequently to be seen. "Hawaiian" dancers generally have taken the place of the "Forty-nine" and "kootch" shows. Rarely are those dancers Hawaiian; as a rule, in fact, the fleshy girls who so pose and wiggle do not take the trouble to stain their faces in imitation of Hawaiians. Frequently, those shows are merely innocuous frauds, consisting only of a little sorry ukulele and guitar playing and grotesque pretense of dancing. But they have all the possibilities of the "kootch" and the "Forty-nine" affairs.

The concession, however, is the mainstay of the carnival outfit. It consists of the privilege sold by the management to individuals to operate stands and booths, like the "juice stand," "cook shop," "wheels," "grind stores," and so on.

The "juice" concession carries the privilege, usually exclusive, of selling lemonade and other soft drinks on the "lot," as the show place always is known. You've seen the glass jars filled with red and creamy colored liquids in which float the halves of lemons. But that doesn't mean lemons necessarily figure importantly in preparing the liquid. In the trade paper of the carnival business you will find many advertisements of powders from which orangeade, lemonade and like drinks can be made in quantity lots, cheaply and quickly. "Just add cold water and sugar," says one of those advertisements. "A pound makes almost a barrel. You make 80 cents clear profit on each dollar you take in." The information as to what the powders contain is not vouchsafed. The lemons with which the "lemonade" may be camouflaged can be used over and over—until they wear out from constant handling.

The "wheels" are outright gambling devices. They are crude adaptations of roulette to communities that abjure gambling as sinful and criminal. In fact, it is unfair to gambling to make the comparison, for in any except the outright crooked kind, gambling presumes something like equal chances between the players. But with the carnival "wheel," even when "honestly" operated, the chances are anywhere from 10 to 1 to 50 to 1 against the player and in favor of the operator.

An investigation made by a Chicago newspaper showed that with the "paddle wheels," the most popular and profitable kind, the chances were 3 in 12 of winning worthless claptrap prizes (such as small crockery dolls worth about a penny apiece) while the chances for winning the more imposing prizes were *nil*. That paper found the operator of a "wheel" raking in more than $6 a minute during one period when never more than eight out of a possible 50 paddles were out at the same time. An old concessionaire tells the writer that, at an indoor carnival given by a war veterans organization in an Iowa city, he cleared more than $5,000 in three and one-half days on the operations of a "wheel." This was after paying 15 per cent of receipts to the "auspices" and deducting for all the prizes won by players. That, if true, is an extreme case, but it is not unusual for a good "wheel" operator to take in from $350 to $500 on a single day.

Some communities that permit carnivals with "concessions" appease conscience by forbidding the operation of outright "games of chance" like "wheels," and permitting all kinds of "games of skill"—such as shooting darts at paper tags or sheets of paper marked off in squares with small circles in the center, the "hoopla," wherein you must ring the prize with a small hoop, the various "roll down" games and the throwing games.

I asked one of the most reputable men in the carnival show game about the policy of such communities.

"Why, they merely play into the hands of the worst operators," he declared. "The 'wheels' are really fairer than the so-called games of skill. The operators of 'wheels' merely sell or raffle off goods, at terrific prices it is true, but yet they deliver. With the so-called games of skill the player has virtually no chance; they can be manipulated dishonestly in dozens of ways."

At a recent carnival attended by the writer, a man lost a total of $183 playing one of the so-called games of skill. It was an outright steal. The man was a member of the fraternal order lodge that was supplying "auspices" for the "carnival."

In that particular carnival show there were 25 game booths, three "rides," two palmists, and six "shows." Each of the "shows" was 90 per cent fraud —that is, virtually nothing was given in return for the admission fees charged.

At another there were 21 games, five "rides" and six "shows." At one which heralds itself as among the very best, there were 13 shows, 35 games and five rides.

At all "carnivals" children were permitted and even urged to play the "games." The only thing that can be said for that is that they never win anything, and thus in some cases the experience may serve as a discouragement to gambling.

Operation of the "carnival show" is characterized by two features not common to other branches of the commercialized amusement world. One is the practice, general but not invariable, of operating under "auspices." The other, general but with a few exceptions, of subordinating amusement to what essentially is gambling—and worse. Therefore, as a business, its appeal primarily is not to men with the showman's instinct. Most of its followers are not showmen in any sense of the word; even when showmen, with scattering exceptions, they are of the third-rate kind. They are not, as were the medicine showmen of old, who in part were the progenitors of the modern "carnival" operators, good fakers.

Only one outfit on the list mentioned above uses the word "carnival" in its name. This isn't owing to any meticulous regard for accuracy but to the fact, already stated, that the methods employed by a majority of the companies which have exploited it have brought the fine old word "carnival" into such disrepute that they now avoid it.

Some of them lately have gone as far as actually to call their outfits "Chautauquas"! Says one who defends that practice against the attacks made upon it by the legitimate Chautauqua organizations:

"I am glad to see that we have made the word 'Chautauqua' of such acceptance that it is today held forth by even the humblest of the show world as a name that has some magic power, a box office asset."

And thus "Chautauqua" may be degraded as has been the fate of "carnival"—all because it is "a box office asset."

The Call of the High Road: Auto Camping

Concluded from page 3

is an additional pull of about 25 pounds, which is not noticeable except on down grades when brakes must be applied a little sooner and a little harder and the gears thrown into first speed on steep inclines. The connections between trailer and car must be scientifically worked out and the vehicle must be packed with a little more of the weight in front of the axle. If these precautions are observed, the trailer will ride along behind at any speed so serenely that you will have to look back occasionally to see if it is still with you. A well-designed trailer will not teeter or slither around corners and will not skid more than the car. In wet weather chains should be applied both to car and trailer. Commercial trailers cost from $150 up. Camping trailers cost from $188 up to $1,200, depending upon make and equipment. The trailer has many uses besides camping. It can be employed to haul luggage and light supplies of all kinds and can be set up in the back yard as a playhouse for the children or an outdoor sleeping room for other members of the family.

The fourth method of motor camping is by the use of specially built camp cars on various chassis. I know one man who is having a camp car built on a foreign chassis for $15,000 and a girl who has ordered a camping roadster for $10,000. However, the majority of camp cars you see on the roads, especially in the West, are of home brew. A typical example is that of an Iowa physician, who did all his own carpenter work and produced a sturdy, comfortable camp car on his own chassis for $250. You can do as well as this if you are handy with tools. If not, a local carriage builder will help you out for a price, depending upon your requirements and his conscience. To design a camp car is not difficult. Unless you already have a lot of ideas on the subject, it would be well to adopt some of those employed in the arrangement of camping trailers—entrance from the rear, let-down beds on each side, cabinets and clothes closets aft of them, lockers below, and pantry and cooking arrangements at the front.

There are several companies building extremely interesting and practical camp car bodies on a number of standard chassis (including Ford, Dodge, Reo speed wagon, White three-fourth-ton truck). In these the arrangements differ somewhat but the object is all the same, to provide comfortable, rolling homes for those who would enjoy voyaging over the country without paying enormous railroad fares and a king's ransom for a hotel room. Many of these cars are the last word in simplicity, consisting of light bodies in which the seats are hinged back to form springy beds for two people. Others are the height of elaborateness and completeness. The cost ranges from $350 up.

It has not taken long for the local authorities in cities and towns to realize that the motor camper spreads wealth in the smoke of his chugging exhaust. Approximately 1,500 communities, especially in the Far West, have established public camping parks. In most of these there is no charge. In others it costs not more than 50 cents a car a night. Practically all have free electric light and water. Others supply free shower baths, firewood, outdoor stoves, laundry machines, dining halls, and so on. Denver was probably the first city to take note of the motor camper. In that city there is established a large 160-acre site for motor campers, called Overland Park, with multitudinous facilities for the motor nomad's comfort. This camp cost $250,000 and has proved so popular that Denver is on the point of doubling its facilities. A nightly attendance of 500 camping cars from every state in the Union is not unusual during the season.

There is no law to prevent the prospective motor camper from spending a fortune on his equipment except, perhaps, the law of common sense. The question of clothing is a simple one for men and it is not much more difficult for women. A comprehensive list of suggestions for motor camping equipment, covering clothing, shelter, cooking, eating and sleeping facilities, motor equipment and miscellaneous requirements, has been compiled by the writer. This list is infinitely longer than any one party of campers could or would carry, but it can be varied to suit individual requirements and will be sent to any reader upon request and receipt of a stamped self-addressed envelope.

Say what you will, the success or failure of camping lies in the eating. Numerous companies have realized this and have placed on the market a wide assortment of stoves, cooking utensils, luncheon sets and other aids to gastronomic contentment. The subject of camping equipment is an endless one, but always interesting, since no two parties ever start out with the same assortment.

Motor camping is growing because it produces the maximum of health and enjoyment at the minimum of trouble and expense. A meal of fresh-caught brook trout in the open beats the best dish prepared by the highest-paid chef in the world's finest hotel. If you doubt this, there is a very simple way of determining its truth or falsity. That is, to study up a little on the subject of motor camping and then try it yourself.

"Symmes Hole" at Hamilton, Ohio

Monument to Capt. John Cleves Symmes, at Hamilton, Ohio.

MUCH of the world today laughs at the so-called Einstein Theory, and much of it ridiculed a hundred years ago Symmes' Theory of the hollow earth, habitable within.

In a small park in Hamilton, Ohio, is a monument to Captain John Cleves Symmes, "originator of Symmes' Theory of Concentric Spheres and Polar Voids." It was erected over his grave by his son, Americus Symmes, when the park was a burial ground. It is topped by a hollow sphere, graphically giving Symmes' ideas. Hundreds pass it daily; few stop to recall the memory of one whose name was on the lips of the civilized world for many years.

Captain Symmes was a nephew of John Cleves Symmes, chief patentee of the Miami Lands, was born in New Jersey and entered the Federal Army when quite young. He served through the War of 1812 with considerable distinction and then retired to St. Louis, where he engaged in the fur business.

It was on April 10, 1818, that the nation was astonished by the promulgation of his theory, in the following:

"I declare the earth is hollow and habitable within: containing a number of solid concentric spheres, one within the other, and that it is open at the poles 12 or 16 degrees. I pledge my life in support of this truth, and am ready to explore the hollow if the world will support and aid me in the undertaking."

In a lengthy postcript, he said that his theory was the golden secret of Darwin, who had declared that discovery of the poles would yield great knowledge to mankind.

Copies of the circular were sent to every institution of learning in the United States and many to Europe. Others were sent to individuals. And for years, or until his death, Captain Symmes was the butt of jokes in newspapers and periodicals. These he did not seem to mind, for he kept steadily at his propaganda until illness forced his retirement.

One often hears today of "Symmes' Hole," but few realize that it kept a world in laughter for 10 years, and that its originator, firm in the belief that his theory was correct, underwent many hardships and poverty and found an early grave in support of it.

Missouri Officer Does His Duty, and Gets Fired

St. Louis Department Stores Prove More Powerful Than the Law

MISSOURI, long accustomed to government by political reward and its consequent audacities, just now is aghast at the most recent manifestation of officeholding brass. It has supinely watched administration of public welfare according to the whim of its servants until it expects little better.

But now comes an officeholder who has calmly tossed a state law reading clear as a primer into the discard on the ground that its enforcement violates "office policy."

The state has a statute that forbids sale of the plumage of any but game birds. The law was the reflection of the public repugnance that arose a few years ago against the custom of women to display the feathers and bodies of birds on their hats. The law has rested quiescent because public sentiment reformed fashion and women who unfeelingly and with no twinge of conscience had carted about the carcasses of sacrificed songsters, sought other foibles when fashion wrote *passé*. But reaction has set in. As they have sipped more frequently of cocktails in resentment to prohibition's "no," so now many have begun to cherish anew birds of paradise and aigrettes when they are told that they must not.

Encouraging this sly contempt of the law, St. Louis department stores recently have been exhibiting birds of paradise, and milady, glorying in perversity, has paid large sums for them. They again have come to wear the birds.

A humble deputy, with an amazing fidelity to his job, noted the reappearance of the forbidden birds and sought the source of supply. When he had found it, he seized all the birds, notified his superior, the State Game and Fish Commissioner, and went home to sleep in the consciousness of duty performed.

When he woke next morning he found that he had been "fired."

The State Food and Drug Commissioner told him that the law was not meant to be enforced and that he would not enforce it and would not brook enforcement by any of his subordinates. He ordered the birds restored to the department owners. But a deputy who had spunk to arrest large department-store owners could not be expected to bow thus meekly. He refused to return the birds.

Thereupon feathers began to fly, while the state interestedly looked on to learn if this was to be its emancipation from government by office rule rather than statute.

Seized in Big Stores

THE deputy is John P. Heller, of St. Louis. The stores in which he seized the feathers included the two largest department stores in the city—Scruggs, Vandervoort & Barney, in which he found two plumes valued at $125, and Stix, Baer & Fuller Dry Goods Company, in which he confiscated five plumes valued at $318. Other stores were Sonnenfeld's, four plumes valued at $214.50; Kline's, one plume valued at $65, and Bedell's, one plume valued at $124. The penalty for sale of prohibited feathers is $25 and $5 additional for each bird, a part of whose feathers are offered.

Heller was accompanied on his visits to the stores by United State Game Warden Barmeier, of St. Louis. Possession of birds of paradise is a presumption of violation of a United States act which forbids their importation. The birds do not exist in the United States.

When Heller heard from his chief, it was in the following language: "My position is this. If Mr. Barmeier did not see fit to seize the plumes under Federal regulations, it ill behooves our department to bull the market and attempt to prosecute in the name of the state. We are in possession of a ruling from the Federal Government to the effect that it will not prosecute in these cases. If it finds itself unable successfully to prosecute, we feel that we would simply be causing trouble to try to do so."

Deputy Heller replied that he didn t give a tinker's darn what the Federal statute was. He was sworn to enforce the state law, the state law was plain to him as forbidding women to display birds on their hats and, as far as he was concerned, they would not be permitted to do so.

Failing to budge his subordinate, the State Game and Fish Commissioner turned the matter over to his chief deputy, E. T. Grether. He wrote Deputy Heller a curt letter, asking for his badge, his commission and instructing him to return the birds instanter.

Heller felt that his fight would be a losing one single-handed and made public the State Game and Fish Commissioner's letter. The result was a pouring in of reinforcements. The Bird Club of St. Louis took the left wing, the Missouri Bureau of Conservation and Wild Life Protection took the right wing and the Audubon Society took its position on the center of the firing line.

The State Game and Fish Commissioner sent Chief Deputy Grether to St. Louis. Grether came down and poured a fusillade of abuse upon Deputy Heller, whereupon a half-dozen other organizations came to his support and he began to receive letters from organizations in other states to hold the fort. W. T. Hornaday, of the New York Zoo, wrote him to insist on enforcement. "The United States Millinery Chamber of Commerce is on record as opposing sale of birds of paradise and other similar plumage," he wrote. "Prosecute vigorously any violators of the Missouri law."

Deputy Heller's reinforcements sought the prosecuting attorney's office. They demanded the issuance of a warrant for the offending stores. The prosecuting attorney looked in the statute book, read the law and announced that warrants would be issued immediately.

A week passed. No warrants were issued. The prosecuting attorney was revisited. He was not so sure by now. The department stores were not supinely sitting by.

The prosecuting attorney looked at Deputy Rand and looked at the list of department stores. Then he announced that no warrant would be issued. However, he said, suavely, the department stores would be called in and he felt sure they would promise to sell no more plumes.

Thereupon the Women's Chamber of Commerce in St. Louis joined the fight and went to the prosecuting attorney. That official ponderously read the law again.

The clear intent of the law, he said, was to protect the birds of Missouri. The bird of paradise did not exist in Missouri. Ergo, the sale of birds of paradise was not to be prohibited.

"Read the law," the women said, and the prosecuting attorney read:

"No person shall within the state of Missouri kill or catch or have within his possession, living or dead, any wild bird, other than a game bird; or purchase, offer or expose for sale, transport or ship within or without the state, any such wild bird after it has been killed or caught, except as provided in this article.

"No part of the plumage, skin or body of any bird protected by this section shall be sold or had in possession for sale, irrespective of whether said bird was captured or killed within or without the state. For the purposes of this article the following shall be considered game birds: (Here followed a long list in which the bird of paradise did not appear.)

"All other species of birds," the law continued, "either resident, migratory or IMPORTED shall be considered non-game birds. Nothing in this article shall be construed to prevent the possession of live canaries and parrots."

Deputy Heller pointed out that the statute protected the bird of paradise, a non-game bird, by its reference to "imported birds." And he explained why the United States Government could not proceed against the St. Louis shopkeepers. The Federal law affecting plumes of birds of paradise is in the tariff act of 1913, which prohibits the importation of feathers of any wild bird, and it is well known to those interested in the protection of wild life that bird of paradise plumage in this country, imported since 1913, is smuggled and that to "make a case" the Federal Government must prove that the feathers were smuggled, a difficult task.

"That is why the Federal Game Warden could not act and you have just learned why I could and did," Heller told the prosecuting attorney.

But that official still was dubious. "We must ask the attorney-general," he said. Now, the attorney-general of Missouri, Jesse W. Barrett, is a candidate for the Republican nomination for United States Senator.

After a bit, Deputy Heller scored his first victory. The attorney-general ruled that the law meant what it said and was not to be superseded by any "office rule." The opinion was as follows:

"We are advised that ever since the passage of the Federal law upon the subject, the Missouri fish and game wardens have construed this section to permit the sale of bird of paradise plumage. This construction, which has been continued through several administrations, seems to have been based upon two points: First, it has been believed that the Missouri legislature did not intend to extend its protection to any species of birds whose habitat is entirely outside the United States; secondly, it has been believed that the Federal law was paramount as far as it concerned birds imported from other countries and which might be subject to interstate commerce. Acting in this belief the Game and Fish Commissioner has notified the St. Louis merchants that no effort would be made to stop their sale of bird of paradise plumage.

"Nevertheless, the section referred to is very specific and could hardly be made more so. It prohibits the catching, killing, or possession of any birds except game birds and proceeds to define game birds by setting out a detailed list of the species included in that class. To make the classification still more specific, the act says that all other species of birds, whether 'resident, migratory or imported,' shall be considered non-game birds. The bird of paradise is not listed among the game birds. The conclusion is unavoidable that the letter of the statute prohibits the possession of bird of paradise plumage.

"Whether the state has the power to enact such a law and whether it is a violation of any Federal law are questions for the defense, but need not be considered by the state at this time. We are bound to give a presumption of validity in favor of the statute and to assert the state's right until the action has been held invalid by the courts.

"It is our opinion, therefore, that the section in question prohibits the possession of bird of paradise plumage; at least the state should adopt that position until a contrary decision is rendered by a court of competent jurisdiction."

Test Case Suggested

THEN, addressing the prosecuting attorney, the attorney-general said: "Of course, this office is not empowered to advise you with respect to any particular prosecution, and can pass only upon the abstract question of the law. It is for you to decide whether the facts in the cases before you warrant a proceeding. If the persons involved have been acting in good faith upon the construction hitherto placed upon the law of Missouri authorities, you are, of course, reluctant to hold them criminally liable.

"I venture the suggestion that all practical purposes might be served by making one of the cases a test case under agreement with the St. Louis stores that no further sales be made until the matter is finally determined by the courts."

Again Deputy Heller and his ever-increasing cohorts visited the prosecuting attorney. That official's back was to the wall. He issued information against the five stores, but singled out only one for prosecution, that against the Kline store. The others will rest until a decision is had in the first.

Meanwhile, Deputy Heller still is without his job which he filled in his own peculiar, refreshing way for 14 years.

But he still has the bird of paradise plumes and what's more he intends to keep them. Meanwhile, no other plumes are on sale in St. Louis stores, not even the most powerful.

Price Paid Has Naught to Do With His Value

Concluded from page 10

with the veteran cabby. Each afternoon Lajoie was permitted to do the driving and Lajoie's skill with the reins was the cause of Philadelphia beating St. Louis regularly. Lajoie would speed up the four horses and tear through the streets, taking corners on two wheels, until by the time the players reached the ball park they were so filled with the spirit of the thing that beating them was beyond the possibilities of St. Louis. Stallings explained the success of his team against the St. Louis club by crediting it to Lajoie's driving skill.

Stallings purchased Phil Gaier at the same time that he got Lajoie. Gaier was stocky, bow-legged, a good hitter and he had a great throwing arm. Stallings still maintains that Gaier would have been the greatest outfielder of all time if he had been able to remain in baseball but his career ended before he could join the Phillies. While working in a steel mill after the season closed, a steel splinter entered Gaier's eye and destroyed the sight of the eye although surgeons succeeded in removing the splinter.

No one save Ty Cobb thought particularly well of Harry Heilmann's hitting ability. When Cobb became manager of the Detroit club he immediately set about to remedy one or two minor faults in Heilmann's batting and all Heilmann did as a result was win the batting championship of the American League. Heilmann was secured on the coast and his reputation was none better than that of a flock of other youngsters in the minors. He was a good prospect and nothing more. It took several years to bring him to the top.

But Detroit has always been noted for hard-hitting outfielders. Detroit manages to get them when others fail. Samuel Crawford was a barber in Wahoo, Nebraska. He tried to play ball and finally got a job with a Canadian team. Cincinnati signed him and let him go to Detroit after playing him a season. He became one of the best sluggers in the history of the league. Bobby Veach was a pitcher in Peoria, Illinois. He was shifted to the outfield. From Peoria to Indianapolis to Detroit was the trail of Veach and in Detroit he won glory as a hard hitter.

When the late William Yawkey was actively interested in the Detroit club as a financial backer, a friend of his wrote him about a pitcher in Weiser, Idaho. This pitcher was striking out 18 to 20 batsmen a game with regularity. Yawkey wanted his associates to buy the pitcher but they said the woods were full of the same kind of pitchers.

This player's reputation continued and one day Washington asked a scout to stop off there and look over this chap. The scout looked him over, stepped into a grocery store, got a piece of wrapping paper, had the player sign the contract that the scout wrote out on the wrapping paper and started him for Washington. He was a bit weak on bunts when he started his major league career but that fault was soon corrected and Walter Johnson was off on a meteoric career.

In the coal mines of Pennsylvania was a "mule" boy. There were a great many of his kind in the coal mines. The mules pulled the carts through the underground tunnels and it was the boys' job to walk behind the mule and keep the flies off the beast, for flies bother mules in coal mines and the mules, under the assault from the flies, are liable to become cantankerous and cause trouble.

Any time this particular boy got a chance he played baseball. He did well on the diamond and later on Louisville gave him a chance. He did not do so well there and became discouraged. But Harry Clay Pulliam was a sporting editor in Louisville at the time. He saw great possibilities in the lad, continually boosted him and became his personal friend, greatly encouraging him. It was Harry Clay Pulliam who enabled Hugh Ambrose Jennings to get a start in baseball. Jennings became a great shortstop, entered Cornell, graduated from that university and in 1907 he became manager of the Detroit Tigers and a fluent after-dinner speaker, also a lawyer.

So you see that the dollar sign really does not come before the man in baseball and that its history is studded with romance and color. The "greats" come gradually, from the far corners and unheralded. And, as history also proves, the price paid for a ball player has nothing to do with his value.

Herbert Quick—Bard of the Great Mid-west

Teacher, Lawyer, Editor and Novelist Who Depicts Hardship of Pioneers

By FRED L. HOLMES

THIS is the story of an American author, who, as a Red Cross representative when taken ill in far-off Siberia, drew his last will and testament and in it requested that his closest literary friend should complete the novel upon which he had himself spent his spare moments, for nearly 20 years. Forty years before, in boyhood, he had planned this task—then delayed its consummation from year to year. Strange legal document it was. It imposed on its main benefactor—not a gift, but a literary debt to humanity. The story was to be a heritage in fiction depicting the hardships of the caravan pioneers. The maker of the will was Herbert Quick. He lived to complete the novel. Otherwise, the burden under the document would have been shouldered by Judson C. Welliver, a well-known Washington editor and magazine writer.

That decade of history which deals with the courageous galaxy of pathfinders and pioneers, who subdued the prairies, has been neglected in fiction. Within a score of years those who had participated in those stirring days of land settlement west of the Mississippi would have passed into silence. Raised in Iowa, a youthful participant, a chronicler of many a historic episode he had learned at his mother's knee, Mr. Quick rose as a troubadour to sing the epic history of this dramatic period.

"Welliver and I have been warm friends since he came to Sioux City as a reporter when I was just beginning the practice of the law there," said Mr. Quick as he slid down in the same old office chair he had used when he worked with me as magazine editor back in Madison, Wisconsin, 12 years before. "I went to Siberia for the Red Cross two years ago, and while there became so very, very ill that nobody thought I could live. In fact, I had no idea of living myself. And the greatest load on my conscience—and that shows what kind of conscience I have—was the vision of 'Vandemark's Folly' lying half written in a drawer down here on the farm. So my dying request was a plea to Jud Welliver to finish it! This is deathbed repentance with the reverse English.

"It is only the middle portion of the history of the Middle West which has been neglected in fiction. When there were Indians and buffaloes and adventures of the more violent sort, it went into the works of the fiction-writers and fitted. What I have done is to use the material which lay all about me in my infancy. I took hold of the life which followed the expulsion of the Indian and the buffalo, in the state which had the most peaceful of histories—Iowa. I think it has been neglected because novelists did not see the wonders of it. To me it is the most marvelous episode of all history—the life of the people who made these rich prairies into the Heart of America."

"Why do you write mostly about the West now that you live in the East?" I interrupted, as this mountain of a man, with the frame of a blacksmith, moved restlessly in his chair.

"I do it because I like to do it," he continued as if my question had been an intrusion. "I feel that I understand the Mid-west. Anyhow, before I was grown I planned this history of these people in fiction form. It always seemed to me that there was a great story in it. For 40 years I thought about it. I have not told all of it. The portions I first planned are still to be written, if they are to be written by me. These people were my people, their home was my home, their problems my problems. My father drove across from Madison to Central Iowa just as Jacobus Vandemark did.

"Here we went, oxen, cows, mules, horses; coaches, carriages, blue jeans, corduroy, rags, tatters, silks, satins, caps, tall hats, poverty, riches; speculators, missionaries, land-hunters, merchants; criminals escaping from justice; couples fleeing from the law; families seeking homes; the wrecks of homes seeking secrecy; gold-seekers bearing southwest to the Overland Trail; politicians looking for places in which to win fame and fortune; editors hunting opportunities for founding newspapers; adventurers on their way to everywhere; lawyers with a few books; Abolitionists going to the Border War; innocent-looking outfits carrying fugitive slaves; officers hunting escaped Negroes; and most numerous of all, homeseekers 'hunting country'—a nation on wheels, an empire in the commotion and pangs of birth.

"In this story are the things I heard when I sat on my mother's lap. I did not feel that I could endure the thought of letting any longer time pass without writing it. I resigned five years of my term on the Federal Farm Loan Board just because I had to finish the book which lay half done in my desk. I wrote it because I couldn't help it."

"What is this lesson of the Mid-west?" was asked, as my mind pictured in panorama the replies that one might make from the stories of Hamlin Garland, of Wisconsin; John Neihardt, the Nebraska poet laureate; Zona Gale, the chronicler of village life, and Grant Showerman, the country school fictioner—all of the West.

"The great lesson of the Mid-west," came the reply without a moment's hesitation, "lies in its proof that all civilized humanity needs to build up a great society is free access to land by free men and women; and its future will be joyful or sad, as it solves the problem of giving men in a settled and civilized community the same liberty they had when land was free; joyful if it solves this problem, sad if it fails in the solution. But this is the problem of the ages for all peoples."

Before Herbert Quick, the novelist, was 40 years old he had won worldly distinction in two professions—education and law. Then almost in a day, at a time when most men believe it futile to begin a new career, Quick closed his busy law office, banished statutes and clients, and began to cultivate a boyhood ambition. He set out to be an author.

Born in Iowa in 1861, repeatedly denied a college education because of a succession of illnesses and misfortunes, this country boy of the prairies had read the limited books of every farmer's library within five miles of his father's home before he was nine years old. He was given a country school education; that completed his formal "schooling." Eight years a school teacher, it was during the last three spent as principal of a ward school at Mason City, that this omnivorous reader took the law office route to the legal profession. Although he ranked first at the examination in competition with the college students of the state, he lingered as a pedagogue for another year. In 1890 he began the practice of law.

"One day I became indignant at the way the county and the city were being robbed by their officials," says Mr. Quick, "so I joined one of those organizations of 'kickers,' unpopular people and business men—a citizens' committee seeking to revolutionize the order of things."

It seems that at that time every species of graft was practiced in Sioux City, by deputies, supervisors, and county officials. Within a short time these grafters had systematically plundered the city of $500,000. And then came Rudyard Kipling and called Sioux City one of the three most wicked cities on earth. That alone was enough to demand action.

Following a reorganization of the citizens' committee in 1894, Quick was appointed one of three to ascertain if graft actually did permeate Sioux City's officialdom. Here was an opportunity. A few days later he had enough affidavits to have imposed penitentiary sentences on three or four officials, if tried before most courts of law. Stimulated by the evidence which Quick had gathered, the committee retained him as an attorney to root out the grafters, and gathered a voluntary fund of $10,000, which was placed at his disposal for hiring detectives. Black-hand letters came; threats, ridicule—what not! Every effort was made to end the investigation. Quick retaliated with more evidence, trapping more people in the net. So completely were the grafters driven from public life that not one of the officials caught in the meshes has since raised his head as an aspirant for public office.

Then the reformers elected him as mayor of Sioux City and under his administration he placed the municipality, almost wrecked by the grafters, on a solid financial basis.

"I did not give up the law to go into magazine work," said Mr. Quick, "but because I had written a successful novel, 'Double Trouble,' and thought I could make a living by writing. Then after I had written another story, 'The Broken Lance,' a book worth a dozen 'Double Troubles,' and got very little out of it, save a bitter disappointment, I went into magazine work because Senator Robert M. La Follette, the publisher of a magazine in Wisconsin, wanted to do so. And I found myself so handy a man about a magazine that it was dreadfully difficult to withdraw from it to write novels. I liked the law, I liked teaching, I liked magazine work. I liked official life. My greatest trouble always lay in the fact that any sort of work was interesting and absorbing to me. That's why I waited so long before doing the thing I always planned to do—write fiction as a serious task."

Both physically and mentally, Quick is a giant. Light blue, twinkling, boyish eyes foretell a fund of stories, as many an enthusiastic audience may testify. None, having been within range of his genial presence, forgets the happy, wholesome face, the magnetism of his manner; the keenness of his wit; the independence of his thought. He is a polished orator and a charming conversationalist. But when writing he acts more like a man in a trance. Often he dictates. The thoughts and sentences falling fast, one after the other, strike harder and harder until the climax is reached.

It is on the farm that Mr. Quick finds the greatest enjoyment. Sitting in his study at "Coolfont," Berkeley Springs, West Virginia, he gazes out across the expanse. When literary tasks grow irksome, when his mind is barren of subjects upon which to write editorials for a syndicate of newspapers, he goes for a stroll through his orchard of 50 acres.

"I fondly hope that when I can't write any more these apple trees will support me," said Mr. Quick gazing down the long rows of evenly planted trees.

Then he turned and it was Farmer Quick who continued: "Unless railway rates go down this will probably be one of my wildest dreams."

The Plow Weds the Soil of Iowa Prairie

By HERBERT QUICK

THE next day was a wedding day—the marriage morning of the plow and the sod. It marked the beginning of the subdual of that wonderful wild prairie of Vandemark Township and the Vandemark farm in Iowa. No more fruitful espousal ever took place than that—when the polished steel of my new breaking plow was embraced by the black soil with its lovely fell of greenery. Up to that fateful moment, the prairie of the farm and of the township had been virgin sod; but now it bowed its neck to the yoke of wedlock. Nothing like it takes place any more; for the sod of the meadows and pastures is quite a different thing from the untouched skin of the original earth. Breaking prairie was the most beautiful, the most epochal, and most hopeful, and as I look back at it, in one way the most pathetic thing man ever did, for in it, one of the loveliest things ever created began to come to its predestined end.—"Vandemark's Folly."

HERBERT QUICK

Revealing the Tricks of the Art Swindlers

Methods Employed to Trick Collectors Often Brought to Light; Modern Synthetic Paints Not Difficult for Expert to Determine

By WILLIAM A. McGARRY

This is the second of two articles on the tricks of art swindlers.

A TRICK of art swindlers that worked without detection for more than a century, and then was discovered only by accident, is that of turning one old master into two. How often it has been done will probably never be known, but from the evidence found among the paintings known as primitives in one great American collection it is fair to assume that nearly all large buyers of that type of ancient art have been taken in. Two examples of the swindle were discovered in the collection of the late John G. Johnson.

One was bought as the work of a pupil of Gerard David, sixteenth-century Flemish master, and is entitled, "The Crucifixion." The other was purchased as the production of Dirk Bouts. It is called "The Adoration of the Child." Bouts was born in Holland about the year 1410, and is known as the founder of the Dutch school of painting. Both examples had been in the Johnson collection for some years when Mr. Johnson brought Professor Pasquale Farina from South America to go over his paintings to pick out the true from the false, and to restore the real masterpieces that needed attention.

A primitive, properly speaking, is the name given to a painting of or prior to the fifteenth century. Since most of the examples of that time were religious works and were on wooden panels instead of on canvas, art dealers and experts generally refer to all panel paintings as primitives when they are more than 200 or 300 years old. Among the panels in the Johnson collection Farina found the two named. Both were dark and foggy with the so-called patina or golden glow of age. Professor Farina knew, however, that that was only varnish put on by somebody who had something to hide. He cleaned the David panel first.

In so doing he made the startling discovery that two-thirds of the panel was genuine, while the other third was false. With the covering of gum and varnish removed, a slight crack became apparent. Someone had split the original panel, attached a new piece of wood treated with chemicals to give it the appearance of age, and had painted on it a clever replica of the painting on the section that had been removed.

The paint on the genuine section responded to the microscopic tests and to chemical analysis, when a bit of it was chipped off, as the elemental substances or natural earth colors used by the masters prior to the nineteenth century. But the paint on the small and newer section was synthetic and already had shown some signs of fading with the passage of but a few years in comparison with the other.

A search was then made through the entire collection by Professor Farina, and he discovered that the Bouts panel also had been partly faked. He made inquiries among confidential sources abroad and learned that the false work was a trick conceived by an art swindler searching for ancient panels. This man located many such panels in the homes of impoverished noblemen. They had sold many of their other paintings, but were retaining the primitives and could not be induced to part with them. So the forger suggested that each panel be divided in the manner described, thus producing two apparent old masters, each of which would be partly genuine. That enabled the owners to retain something that seemed to be the same old painting, to show their friends. And it made possible a profitable sale of another partly genuine to a rich American for anywhere from $3,000 to $5,000.

In each instance, after the new section of panels had been prepared and attached, heat was applied indirectly by an electric furnace, thus causing the paint to crack. It was the theory of the forger that no old painting should be without cracks, and, therefore, he always so supplied his output. But heat applied in such a manner causes a contraction of the filler, and the resultant cracks in the paint are turned inward. In the cracks caused by age the edges turn outward, which offered another proof that the two primitives had been tampered with. By the time the trick was discovered it was too late to do anything. Mr. Johnson had the fake sections removed and retained the originals in his collection, where they still are.

In connection with the foregoing it may be of interest to point out that when an old painting is badly cracked the expert restorer can eliminate the cracks by various processes. In some instances when a really ancient painting is brought to light the canvas is so badly rotted that the whole picture would fall apart if not supplied with a new canvas. That is done by placing the painting face downward on a table covered with tissue paper. The restorer then has methods of softening the paint so that it will stick to the paper. When that is accomplished he begins to remove the canvas, a square inch or less at a time. It is a slow and tedious operation, but eventually the entire canvas is taken away. Then a new canvas, properly treated with filler, is placed over the back of the painting and pressed down until the masterpiece sticks as tightly as it did originally to the old canvas. It is then a simple matter to wash off the tissue paper, meantime pressing out the cracks in the painting.

Photo of a supposed Van Dyke painting of Charles I. of England, purchased by the late John G. Johnson, of Philadelphia. Note how the line of a differently shaped collar is partly revealed under the lace.

Photo of original painting on which the fake Van Dyke was superimposed. Probably the likeness of a Spanish courtier, done by a pupil of the Flemish seventeenth century master.

Many of the finest collections in the country have been ruined by treatment by inexpert restorers, who really know only a little about cleaning. It is their custom to wash the painting with alcohol, a raw potato, or some other substance. Then they apply varnish, covering up the imperfections of their own retouching quite frequently with a dark varnish or wax.

The real restorer, however, must know how to draw and how to master the palette. He must have a knowledge of the anatomical structure of the human body, and be acquainted, if only in a general sense, with psychology and philosophy. He must have some knowledge of mythology, of sacred and legendary history and he must have read the general history of the world. He should be acquainted with social, political and religious events developed in a given period, their surrounding traditions, costumes and usages, in order to judge the time and place of a painting. He must by all means become familiar with the technique of each master of bygone times, with the basic characteristics of a certain group or of schools, and he must possess also fair knowledge of the chemistry of colors, to discern the permanent ones from those subject to chemical change.

"In painting, as in writing," says Professor Farina, "there are some determined touches or lines which will constantly be recognized as belonging to the individual characteristics of the one who paints or writes. The artist worthy the name can never avoid repeating himself in his different productions, in one way or another. He must and will lay down in almost every one of his pictures some note or color or detail that he has been fond of since first he began to paint. That happens more surely if the artist is working by inspiration. A forger, used to copying or imitating, might lose his own characteristics in an effort to make his copy a geometrical rather than an artistic work. But he will never make a copy or imitation so perfectly as to deceive an expert who has devoted himself to the peculiar manner and style of any school.

"A genuine picture is in relation to a forged one as a genuine diamond is in contrast with the chemical imitation. The laying of colors or tints, the stroke of the brush, is never, everywhere in a copy or imitation, given with absolute freedom. It is not possible for a copyist to get any such effects, especially in what are known as high lights, as the creator or originator of a picture obtained by a free, quick, spontaneous stroke of his brush, while he caught it at the instant of spontaneous inspiration. In the work of a copyist there will always be found a certain uncertainty of treatment which gives to the expert the suspicion that something is wrong. The copyist is compelled to go over and over again on certain spots to obtain the closest similarity to the effect obtained in the original, so that the quality of diaphaneity of tint and purity of tone is totally lost in the end."

It was that failure of a forger to develop a free stroke of his brush that led to the discovery of perhaps the most expensive fake in the entire Johnson collection. While Professor Farina was in South America, long before he had ever met the noted Philadelphia attorney, Mr. Johnson purchased at a high price a painting attested by various foreign and American "experts" as the work of Andrea del Sarto, an Italian master, whose period was from 1486 to 1531. It was entitled, "The Holy Family," and when Farina was put in charge of the collection it had been hanging in the Johnson home for many years. Under superficial observation it seemed to be a perfect example of Del Sarto's work. But two horizontal cracks had developed across the picture, just under the chin of the Madonna and across the face of the Child.

When the restorer expressed the opinion after microscopic examination that the painting was spurious, Mr. Johnson at first was loath to believe him. He said he had been told that the painting was of such extraordinary delicacy that he should never permit anyone to clean it, as any such attempt would be fatal to its flower-like beauty. But it happened that the group was painted on a wooden panel and the cracks were not with the grain of the wood, as is invariably the case in a genuine painting. It was finally made apparent to Mr. Johnson that something had been superimposed on the original. He sent the painting to the restorer's studio.

After a further examination that verified his original opinion, Farina cleaned off a bit of the modern, synthetic paint on the chin of the Madonna, revealing beneath it a much heavier and rather ugly chin done in the early elemental colors. Mr. Johnson then authorized the cleaning of the whole portrait, having been convinced that Del Sarto could not have painted the visible group. When all the modern paint was removed there was revealed a Holy Family group painted apparently by some fifteenth century art student of a different school. It was little more than a daub and had no artistic value save as a curiosity. Mr. Johnson thereupon destroyed the panel.

It must not be supposed, however, that every time a valuable painting is cleaned of the dust, varnish and wax, accumulated during the years, a fake is discovered. Quite often the contrary is the case, and beneath the dark and gloomy patina is revealed in all its original brilliance and purity of tone a real masterpiece.

Francis R. Welsh, a Philadelphia banker and broker, made such a fortunate purchase. Several years ago he bought at an art auction in New York a large canvas sold as a possible production of Titian, the Venetian, who is still considered in many respects the greatest painter of all time. Others have arisen with special attributes, but from the point of view of technique and the ability so to manipulate his paints as to present a pleasing composition devoid of defects, Titian is recognized as the greatest of the old masters. Therefore, his paintings are of extraordinary value. In this particular case, however, the work was so dull and covered with dirt that it was impossible to make out

any of the dim figures in the background. There was apparent only the nude figure of a woman half reclining on a couch. Various restorers had refused to attempt the task of cleaning it, mainly because there had been a controversy as to its authenticity and none wished to take the responsibility of revealing a fake.

The painting had been in the hands of Mr. Welsh for some years when he decided to send it to Farina. I had the privilege of watching some of the cleaning process. The restorer first removed all the dirt, varnish and wax from a panel down the center. The effect was startling. Shining out of the smoky background of the rest of the painting, the original colors and flesh tones literally glowed with living brilliance in comparison with the uncleaned portions. The work of cleaning the whole picture required many months, but when it was completed the owner would not have recognized it had not he, too, watched a great deal of the cleaning process. He had been permitted to see a real masterpiece emerge from the obscurity of years.

Prior to the cleaning, Dr. Osvald Siren, noted Swedish authority, was the only one of many art critics abroad who would say positively that the canvas was a Titian. Others refused to deny its authenticity, but doubted it. When the original, everlasting, fadeless colors were brought out in all their glory there was no longer the slightest question of its genuineness. None but Titian could have produced such a work. A survey then was made to determine its history. It was found that it came to the United States from the collection of Earl Dudley, of London, where it had been for many years. While there it was the subject of constant controversy, which is what determined the Earl to sell it.

The search disclosed that up to the time it was acquired by Earl Dudley it had never been doubted as the work of Titian. It was traced back to Manchester, England, where in 1857 it was among art treasures on exhibition. Again in 1871 it was exhibited at Burlington House. The Blakeslie gallery acquired it from Earl Dudley, and at Mr. Blakeslie's death it was sold with other valuable paintings. Quite recently it was estimated in New York by art dealers that the present value of the painting is not less than $150,000, but it is not for sale.

Other restorations of even greater importance have been made by Professor Farina in the Naples National Museum and in other great Italian galleries where the works of great masters had been untouched for centuries, so that the figures had become thoroughly obscured. Commendatore Spinazzola, director-general of the Naples Museum, called his work a "revelation and a revolution in art matters." More than a dozen of the finest paintings in the Italian galleries were brought to their original brilliance merely by the removal of the accumulated dirt of years. But perhaps

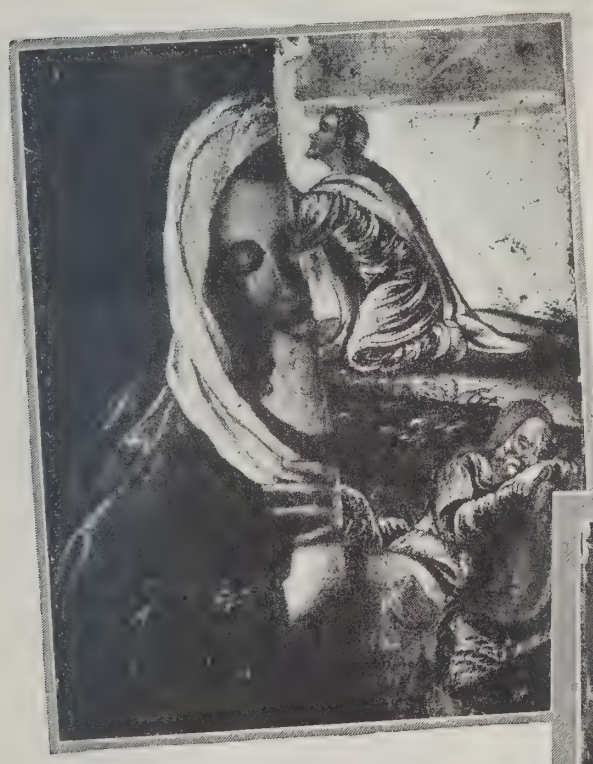
PASQUALE FARINA was born in Naples, and at the age of 17 was appointed assistant professor of chemistry in the Royal Hospice of that city. He had been interested in that science as a side issue to his study of the fine arts, which began in his early childhood. For some years he studied art, painting and sculpture at the Academy of Fine Arts at Naples. He was given the degree of professor of lineal, ornamental and figure drawing by the Academy in 1885.

In 1887, he went to Buenos Aires and during the 13 years he remained in South America studied methods of restoring old masters. Professor Farina has made restorations of famous paintings by early American artists for many public galleries as well as for innumerable private collections.

of another painting beneath. With the zeal of the true antiquarian he decided to remove the work of Pontormo to reveal what was under it.

In the inner angle of the left elbow of the Madonna he first cleaned away a small portion of the last painting which brought to light an old man's head painted with miniature-like care—the head of St. Peter. When the entire painting had been cleaned he found on the wooden panel a well-executed painting of Christ in the Garden of Gethsemane, the work of an unknown artist, but at least a century older than the Pontormo. The photos reproduced herewith show the various stages of the cleaning process, the original Madonna and the more ancient painting on which it had been superimposed. Of course, there was no suggestion that the later Italian master had resorted to trickery. In his time there was not sufficient demand to make art forgery pay. He had simply grasped the nearest panel when seized with inspiration, and had used it as the foundation for his idea of the Madonna.

The foregoing incident is sufficient to show that every painting over an earlier one is not a fake. The practice of using studies and sketches on wood and canvas as the foundation for more finished work has been universal since men first learned to work in colors. It exists until this day. When an artist is in a hurry it saves time, as the first painting has primed the canvas. When the new paint is of the modern synthetic structure, however, and when the whole work is attributed to some artist who had never heard of such mixtures, it becomes obvious that trickery has been used.

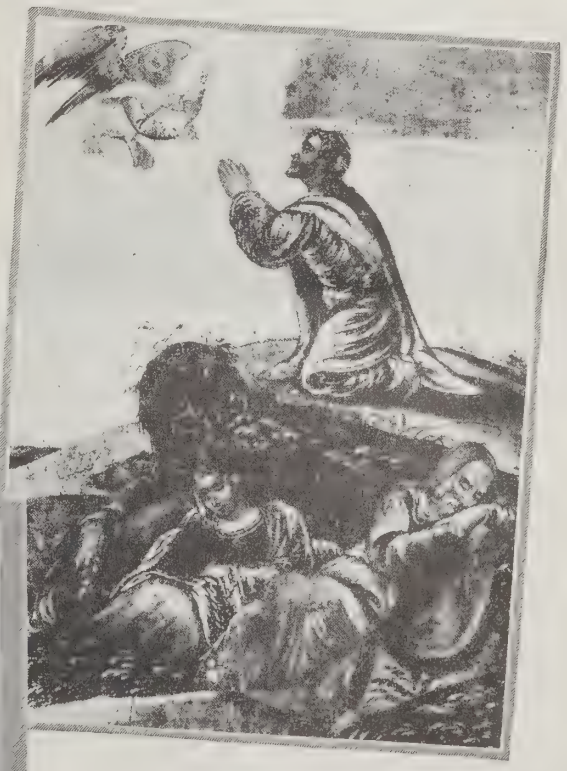


A few years ago Professor Farina was engaged to restore and clean the more valuable works of art in the Wilstach Collection, previously referred to as owned by the city of Philadelphia. Included in that collection as one of its most prized objects was a painting that had been tentatively labeled "Youth and Love" and that was unquestionably the work of Carlo Dolci, famous Florentine master, who rose to fame in the middle of the seventeenth century and died in the year 1686. Dolci is chiefly noted as the man who created a new school of painting in religious works to replace that of Correggio. It was a smoother, more pleasing form that still persists. The Wilstach example was one of the best of the school, but nowhere in the published lists of Dolci's work could any reference to it be found. The painting was described in the Wilstach catalog as follows:

"A charming picture, in which is shown a woman standing at a table, on which there is a great dish, filled with fruits of all kinds. Behind her is an attendant, and in the foreground is a delightful little cupid. The background is very dark, but the coloring is exceedingly rich in tone, and the picture is painted with a great wealth of detail and with the most exquisite charm and sweetness."

When Farina went to work to restore this painting he first examined it with the most minute care. And he became convinced, before he had made any analysis of the pigments, that there was something wrong with it. "No meaning can here be deduced from certain kinds of beautiful fruits, perfectly rendered, placed before a group of figures seemingly surrounded by a tragic atmosphere," he wrote in a preliminary report. "There is a standing figure, manifesting pride and a self-conscious sense of physical beauty, with a disdainful expression on her face. A maiden at her side with a very sad face inclines toward her while observing the contents of the silver dish filled with fruit and holding a pitcher with both hands. At the left-hand lower corner there is an angel, holding a garland of flowers. This forms a peculiar ensemble of conflicting persons, with things as accessories very far from according in symbolism with the individual meaning of each figure, and still less, therefore, with the large imaginative thought of the artist's conception."

On the basis of that report he was authorized to make a more detailed analysis. In so doing he discovered that the pigments of the fruit, the dish and the scroll held by the supposed cupid were all modern. Then, in the presence of the curator, he removed the paint from the center of a rosy-looking apple, and disclosed beneath it a human eye, closed. Removal of all the fruit revealed the head of John the Baptist, while the garland of flowers became a scroll containing the inscription "Parate viam Domini"—(prepare ye the way of the Lord). The paint of these objects, as of the rest of the composition, was in the everlasting primal colors used in the time of Dolci.



In many of the older catalogs of Dolci's work there is listed "Salome with the Head of John the Baptist." But for 200 years the masterpiece had been lost, and it had never occurred to anyone that the work was hidden merely by changing a head to a basket of fruit. What happened, in all probability, is that some art dealer sought to sell it to a rich patron years ago, and objections were made to the severed human head. So the artist covered it with a basket of fruit to be accommodating. The picture was bought for the Wilstach Collection by a committee headed by Mr. Johnson. It is far more valuable today than when the purchase was made.

The same painting as that shown below, partly cleaned, reveals beneath it a still more ancient masterpiece.

Photo of a Madonna by Pontormo, Italian master, purchased by Professor Farina.

Revealing the painting of Christ in the Garden of Gethsemane which Pontormo used as the basis for his Madonna, disclosed beneath the Madonna shown below.

the greatest achievement in the restorer's record was his work on a large group of masterpieces owned by John Wanamaker, of Philadelphia. They were rescued from a burning building years ago, but had been so thoroughly blackened by smoke that it was thought they were ruined. There was no vestige of the coloring and the supposition was that the paint had been burned and the compositions lost. Professor Farina spent months in the cleaning process and found that the ancient paints were still intact. When the smoke was removed they were as good as when first painted.

Professor Farina was responsible for the destruction of a real masterpiece painted by Pontormo, the teacher of Il Bronzino and by far the greater master of the two. The subject was a Madonna. It was acquired by the restorer at Naples in 1910 from Chevalier Menuzzi. At that time the painting was so covered with the so-called "golden glow" that it was almost impossible to discern the features of the subject's face. It had been attributed to Pontormo, but no one could say for a certainty that the attribution was correct until the painting had been cleaned. In cleaning it Professor Farina discovered in one corner traces

BRIEFLY TOLD

The clang of the fire gong roused the chief of the Corvallis, Oregon, fire department, who was coming out from under the ether following an operation. Doctors, attendants and nurses in the hospital failed to hold him and, half dazed, he jumped in his car, dashed up the street and arrived at the fire in time to direct operations.

An extensive art fraud was made known recently when experts discovered many bogus antiquities in the Li Hung-Chang collection, purchased by a Swedish syndicate in 1919 for more than $250,000, from the son of Li Hung-Chang, deceased. According to the story published in Stockholm, Li Hung-Chang's son used a few pieces of his father's art treasures as the nucleus of a large collection which he purchased in Chinese shops for almost nothing and advertised as Li Hung-Chang's own collection of a lifetime. The Swedish syndicate bought the lot upon supposedly expert advice.

The Prince of Monaco has been awarded the Vega medal for his oceanographic research. This medal is regarded as a great distinction and has been awarded 20 times, the last three recipients being Sir Ernest Shackleton, Captain Roald Amundsen and Knud Rasmussen.

Fifteen per cent of all cloth manufactured in Germany is made of sweepings, rags, clippings and cotton waste.

The latest method of sinking concrete piles was recently demonstrated in Omaha, when four piles were sunk, the first, 40 feet long, in 90 seconds. One pile, weighing more than six tons, and 45 feet in length, was sunk to bedrock at a depth of 84 feet. Each pile carried a water pipe set in the reinforced concrete. Water is forced at a high pressure through this pipe, digging a hole as the pipe sinks by its own weight.

Nearly every Sunday afternoon a prominent Chicago business man takes a whistle and stands at an intersection of Sheridan road directing traffic for pleasure. At this point the pleasure traffic is so heavy that an average of 40 machines pass every minute in the afternoon hours.

A journalist in France, 101 years old, contributes an article every week to a French provincial newspaper.

The airplane thief is the latest type of criminal. In Spokane two men appropriated a Curtiss biplane, started the engine and ran the plane a quarter of a mile down the field wrecking it in a collision with a board fence. The damage amounted to $1,000, and the thieves escaped.

The United States spent $600,000,000 for roads during 1921.

"Aspects of Jewish Power in the United States," Volume IV in the series on "The International Jew," comprises a fourth selection of articles on the Jewish Question, and is now off the press. It contains 246 pages, and will be sent for the cost of printing and mailing, which is 25 cents.

"The International Jew," Volume I, "Jewish Activities in the United States," Volume II, and "Jewish Influence on American Life," Volume III, 235, 256 and 256 pages respectively, sent for 25 cents each. The complete set is one dollar.

While the district attorney was making an impassioned appeal to the jury in The Dalles, Oregon, recently, "Indian Spencer," in from the Warm Springs reservation, stepped to the judge's rostrum, and, in tones audible in all parts of the crowded courtroom, asked the judge, an old friend for the loan of 50 cents. The district attorney paused, stammered, and joined in the laughter. The Indian got his 50 cents and departed, the judge's gavel pounded and the trial was resumed.

The reputed discoverer of the Klondike gold fields died in Vancouver, British Columbia, recently. He kept 22 nuggets from the first two pans of gold he washed on Bonanza Creek and had them made into a golden telegraph key which was presented to President Taft in 1909 and used by him in opening the Alaskan-Yukon Exposition in Seattle.

Ice cream was first made in Japan and reported by travelers to that country as early as the thirteenth century.

Radio compass stations on the Great Lakes will rob the "Graveyard of Ships" of its terrors. Stations are being opened at White Fish Point, Detour and Grand Marais and when they are in operation the passing ships will receive their locations from two of the stations, and plotting those two lines on the chart, the skipper will know his ship is at the point where the lines meet on the chart.

Mount Kenia, in Africa, is nearly three and one-half miles high and straddles the equator. The summit is always covered with snow and in climbing to the top one passes through all the climates known from the tropics to the arctic.

New York City has more than 500 women physicians and surgeons.

The brewery that made Milwaukee famous is now turning out chocolates by the ton and helping the candy industry to maintain its position of fifth place in the industries benefited by prohibition.

Seven trainmen were recently asphyxiated in a tunnel near Bourg, France, by the coal gas fumes from the engines.

The rainbow trout has been successfully introduced into the streams of Louisiana.

Not only is the Passion Play being presented at Oberammergau and Los Angeles, but a version of the life of Christ is to be played at Erl in the Tyrol. Like Oberammergau, the plays at Erl were originally performed in aid of the plague-stricken districts and date back to 1613, since when they have taken place every 10 years, all profits going to the church or charity.

Americans from many states paid tribute recently to Pocahontas, the Indian maiden who saved from death, famine and utter confusion the first struggling colony of white men of this nation, when they attended the unveiling ceremonies on the historic ground of Jamestown Island, Virginia.

Railroad crossings have killed an average of 18,000 persons annually for the past three years, according to the general safety agent of the New York Central Lines.

All staterooms on the liner Leviathan are to be equipped for radio receiving.

A new anti-bandit gun, shooting at the rate of 1,000 shots a minute, was recently demonstrated in New Jersey. It can change from .45 caliber steel jacketed bullets to fine birdshot. It weighs nine and one-half pounds and does not overheat during action.

Doctors and lawyers of Japan advertise extensively and it is not considered a violation of professional etiquette for them to do so.

The *Daily Berlin American*, a new English language paper, began publication in Berlin in March. This is the first daily in English language ever printed in that city. It is five marks a copy, about eight times more than that of the German dailies.

Germany launched more shipping during 1921 than in any previous year of her history.

"Hokum": The Tarnish on the Silver Screen

Poor Pictures Result of "Jazzing Up" to Bring Out "Heart Interest" Effects

ONE of the large number of publications, devoted exclusively to the motion picture industry, tells the reading world in general, across its cover page:

> "Our duty is sacred—for Pantomime, the mother of the Motion Picture, determines the future—determines it because Visualization is the mother of Thought. And Thought controls the destiny of men."

The motion picture industry is only halfway like the hero of the musical comedy who "seen his duty and done it noble." The motion picture industry realizes that it has a duty to perform but how to perform it continues to be a matter much argued without any decision being arrived at.

The most powerful instrument in the United States is the daily newspaper and next in power is the motion picture. The motion picture is thought by many to be even more powerful than the newspaper. The human race has been reading for the last 200 years (reading was not much indulged in before that) but people have been looking at pictures ever since Adam and Eve looked upon the apple.

Pictures Hold Attention

ONE of America's most successful publishers built up a vast circulation for his papers by basing his operations upon this fact. He emphasized the value of illustrations and saw to it that his papers each day printed plenty of pictures. Along with the pictures he used large type. The pictures and type caught the eye and he knew that if he could get an attractive picture upon a page, that page was certain to be looked at. The first thing the reader does is to look at the picture. If the picture holds his attention he will let his gaze wander to the type that surrounds the picture. So this editor, making illustrations of paramount importance built up a mammoth circulation. It was more natural for people to look at pictures than at type, so he gave them pictures and by having them look at the pictures he got them to read the type later. That was his logic. To prove its value he shows you his circulation figures.

Since people will look at pictures before they will read, or since they would rather look at pictures than read, the silver screen has a greater drawing power than the public print and more power can be wielded by illustrations than by the printed word. So the motion picture industry has even greater possibilities than the newspaper.

That this power has been misguided and misused is generally charged. The layman says the motion picture business has failed utterly to take advantage of its remarkable opportunities. The student makes the same charge. And now comes the motion picture producer and admits it.

But, why? The reason for the failure is difficult to determine. The old excuse that it was the fault of the directors no longer holds good. The directors were long blamed. Then the performers drew the burden, then the producers. No one denies the failure but all deny being guilty.

During a conversation with a prominent motion picture director he admitted pictures were bad and most of them extremely bad. He said:

"I have never made just the kind of picture that I would like to make. I have never yet turned out what I would call a good picture. I hope to some day.

"I am a successful director, successful according to the standard by which success and failure are judged in the industry. I am successful because the pictures I produce are successful. They make money and since they make money my employers consider them successful.

People Like the "Hokum"

"I HAVE just left our manager's office. One of my pictures, released two months ago, is proving a remarkable success. Why? It has paid the company every nickel that was used in producing it. The picture is still running in first-class houses. It did not cost so much to produce it. It will run in this country for another year or so and it will be produced in many foreign countries.

"You have seen the picture and don't like it. Well, it isn't a good picture. But it draws. Our manager tells me it is the biggest money-maker of the year.

"Why does it draw? I will tell you why. It is filled with 'hokum.' I jammed it up with a lot of 'hokum,' the sort of stuff that you and I regard as silly trash. But the public eats it.

"Pictures are produced to make money. Remember that when you criticize them. I am not saying that they should not be criticized but when you ask me why we don't make better pictures all I can say is, it is because we cannot run the studio at a loss.

"A studio is just like a factory. It did not used to be that way but it is so now. Everything is done on a business basis. We have efficiency experts and all that sort of thing. Before I start 'shooting' a picture I have to submit all my plans to the business experts. They go over every scene and minutely figure out the cost. They know what the picture will cost before a camera crank is turned. They study the scenes carefully. If I am planning on a desert scene and want to use 30 camels, the efficiency expert will try to figure out how the same scene can be shot with five camels. Saving the hire of 25 camels reduces the price of the picture considerably. If I want to use 10 elephants, they will show me how I can get along just as well with two. If one of the important scenes of the picture calls for a mob of, say, 500 persons they will figure out some way in which that scene can be eliminated. They will change the story so that the scene will not be needed, if there is no other way to cut down the size of the crowd.

"I am just trying to show you how things are conducted. It is a business proposition, not art. A picture costs so much money and it must bring in so much money to pay for itself and so much more to provide a profit.

"It is aggravating, but those are the conditions and, from the standpoint of the men back of the company, the men whose income depends upon the profits, I suppose they are correct. No one can manufacture pictures and lose money on them, as a regular thing, any more than a man can manufacture matches and sell them below actual cost. Art comes secondary and if art in any way lessens the chance of profit, art is entirely eliminated.

"I have tried to show you that it is necessary to make money to continue making pictures. One cannot go without the other. To make money you have to make the kind of pictures that the public will pay to see and if you do not make the kind of pictures the public wants the public won't pay to see them.

"So, after all, it is the public that is to blame if the pictures are not what they should be. We have made money in the business by catering to the public taste and if we had not catered to the public taste we could not have built up this enormous industry.

"You may laugh at the pictures and I may laugh at them. I have told you why my latest picture is such a success—because I have filled it with a lot of 'hokum,' plain bunk. The public relishes that 'hokum.'

"During the army examinations, when soldiers were tested as to education, I believe the tests showed the average to be the same as the normal average intelligence of a 15-year-old boy. So, if the army conclusions are correct, the motion picture producers, to be successful, must produce pictures that will appeal to the intelligence of a 15-year-old child.

"That is nothing new or novel. One of the most successful theatrical producers this country has had is George M. Cohan. He made a fortune out of his productions. They were the biggest money-makers for successive seasons and when Cohan was asked for the secret of his success he replied that he employed only such things as would appeal to a boy of 14. His argument was that the same things that appeal to a boy of 14 will appeal to a man and woman of 40. And no one can deny that Cohan was not successful. He catered to the popular taste.

The Motion Picture Defense

"CONSIDER our daily newspapers. How often have you heard people remark that they are filled with trash? Maybe so, but the newspapers, like the motion pictures, are conducted to make money. The publisher watches his circulation as the picture producer watches the little pink slips that tell him the receipts. A paper's success depends upon circulation and to obtain circulation the newspaper aims to give the public not what the public should have but what it thinks the public wants and if the circulation rises then the paper is satisfied that the public is getting just what it wants and the public gets more of the same thing in the same columns.

"Mrs. Margot Asquith, giving her impressions of the United States after her recent lecture tour, devoted considerable space to telling what she thought of American newspapers and the shallowness of them. Her observations were correct, also her conclusions and her conclusions were that the papers fed the public exactly what the public wanted to be fed instead of what the public should be fed. Publishers and motion picture producers both must live. I have known both and have still to find a pure philanthropist among them."

That is the motion picture defense. The directors and producers say they will give the public anything it wants and it is up to the public. They will not give the public what the public will not buy for that would be creating financial disaster.

That it is impossible for the motion picture industry to make better pictures is not correct. They can be made. There have been several excellent pictures released. Every now and then the producers have experimented with pictures that lacked the 'hokum.' Each and everyone of these has proved a failure financially.

One producer pointed out to us, when we mentioned three pictures that were far above the average standard of motion pictures, that they were flat failures. We retorted that we had seen these pictures screened in three of the leading cities and that in all three cities the pictures were shown before packed houses.

"You are correct. You saw the pictures in three cities. They played before packed houses. But, these were what we call 'first run' houses. And, you can take all the 'first run' houses in the country and you will have a small percentage of the houses that we have to depend on for our profits. The pictures you mention did go remarkably well in the 'first run' houses. They packed them in there but, when these same pictures were shown in the 'second run' houses and in the theaters that come after the 'second runs' they did not draw at all and what we made on the 'first run' houses was all lost after the reels left there. Not one of the pictures you mention made a dime and all of them lost big sums of money for the producers."

There appeared in this country several German films, produced abroad. Featured in these films was an actress named Pola Negri, incidentally the best actress of the screen. One picture was released under the name of "Passion." Now, this picture called "Passion" was really "Du Barry." The film version was true to the stage play of that name. That is unusual, for when a stage play is adapted to the screen it is generally changed about, sometimes so much that one hardly recognizes the connections between the picture and the play. But this "Du Barry" of the screen was really better than the "Du Barry" of the stage, with every feature intact and pictures used to broaden the scenes and the story. The situations were not changed.

"Du Barry" was a remarkable picture, one of the best ever released. However, the purchasers of the rights to produce the film in America, were certain that the picture would never draw under its proper name so they called it "Passion," believing that noun much more powerful in attracting customers than the proper name of "Du Barry."

Since that time David Wark Griffith, generally regarded as the foremost producer and director in the country, produced a picture called "Orphans of the Storm," a film version of "The Two Orphans."

Griffith's "Hokum" Spoils Film

IN "ORPHANS of the Storm," as in "Du Barry," several of the situations dealt with the French Revolution. These situations called for the same scenes and here was an excellent opportunity to compare the work of one of the best European directors with that of the leading American film director. The difference was vast. The American picture was to the European film as musical comedy is to grand opera. Griffith, to put his picture on a successful basis, filled it with "hokum." He "jazzed it up," or "hopped it up," as the expressions go. He put in what the aforementioned Mr. Cohan would call "ten-twenty-thirty stuff," referring to the cheapest brand of melodrama. The Griffith production was maudlin. In many places it was stupid. It was a sort of vaudeville version of the French Revolution. In a pictorial way he introduced the sort of matter that the newspaper writers who are known in the profession as "sob sisters" write. He relieved the cold facts of history with up-to-date stage tricks, plain "hokum."

Griffith was making a picture that would make money for the men financially interested in the picture. Griffith was trying to create a popular seller and he undoubtedly did. But Griffith did not produce the kind of picture that Griffith would like to produce. Griffith is an able man, a good director but Griffith tried to make the kind of pictures that he thought the public should have. That is why Griffith today is producing pictures for other people instead of for himself. Griffith discovered that to make money it is necessary to give the public what the public will pay to see.

There are, in the motion picture industry, plenty of intelligent and intellectual men. In the leading studios there is equipment that would startle the average critic of pictures. With plenty of financial resources the producers are able to get the best literary talent in the world today. They have access to everything needed to make any sort of picture they want to make. In the studios are laboratories where constant experiments are made, experiments with light, photography, effects. Experiments in developing pictures, in screening them. High-paid scientists are at work every day trying to improve the pictures mechanically.

Actors Ofttimes Not Wanted

IN THE motion picture industry are many men and women who can act. Their talents have been declined in favor of men and women who cannot act. As long as the public prefers a pretty face and a shapely figure just so long will pretty faces and shapely bodies move in close-up procession upon the silver screen.

There have been few actors of talent on the legitimate stage in the last 10 years who have not had their fling at the motion picture game. Practically all of them, at some time or other, have tried it. But, there is really not one leading performer on the screen today who was, before entering the motion picture end of the entertainment field, a prominent headliner on the stage. It is true that nearly every prominent motion picture star of today had stage experience before entering the picture-making field, but not one of them stood out on the legitimate stage.

The motion picture business is something else again. What makes an actor successful on the stage does not make him successful on the screen. The theater-going public and the so-called "screen fans" have different tastes and although the producers have tried the choice of the theater taste on the motion picture patrons they failed to find it appealing.

Probably, when the picture-going public develops a preference for the same talents that make for success upon the legitimate speaking stage then will there be a different kind of pictures produced.

The motion picture industry cannot make a serious appeal to the public as long as the periodicals devoted to the industry follow their present policy. This includes the motion picture weeklies and monthlies. Of these there are an amazing number. The subject matter is handled in the same way as the articles that appear in the Sunday supplements of the so-called

(Concluded on page 13)

The Banking Myth Is Exploded by Engineers

Heart and Conscience Invade Profitably Sacred Finance Realm

By FRANK HILL

A "BANK with a soul" is the way Warren S. Stone describes the Brotherhood of Locomotive Engineers Co-operative National Bank of Cleveland, Ohio, of which he is president. This institution is pointing the way to a new era in finance in which credit will be used exclusively for the production of wealth and not for the exploitation of the people. The Brotherhood Bank opened for business on November 1, 1920. May 5, 1922, it had nearly $15,000,000 in deposits, and money was still coming in from all over the United States.

During the first year, the bank earned expenses, paid the stockholders six per cent, set aside 20 per cent to be added to the surplus, and on November 1, 1921, issued the first dividend check ever paid by a national bank, paying more than five per cent on savings. This record is phenomenal, for a national bank is not expected to make more than expenses at the outset.

Mr. Stone, president, is Grand Chief of the Brotherhood of Locomotive Engineers and in telling how the bank came to be organized, said:

"Some of us had been thinking about starting a bank for a number of years, but we were restrained by the thought that the banking business was a great mystery, which could be understood only by the elect few. However, we decided to look about and find what the people were doing in other countries. A close study was made of the little co-operative banks of Europe. To our surprise and gratification, we found that they were being managed by ordinary people. There are 65,000 small banks or credit unions scattered over Europe and Asia. They did a business in 1918 of $7,000,000,000. Sixty per cent of the workers and farmers in charge of this business cannot read or write. Yet during the 70 years these banks have been in operation they have not lost a cent. We decided that if the illiterate working people of Europe could succeed as bankers, we might hope to do likewise. So we decided to make the venture.

"The proposition was laid before the International Convention of the Locomotive Engineers in Cleveland in 1918, and the advisory board of the 12 grand officers was given power to act. A capitalization of $1,000,000 was fixed, the stock to be held exclusively by members of the Brotherhood of Locomotive Engineers. In the stock subscription blank, we inserted a provision that the maximum annual dividends should not exceed 10 per cent on the capital stock, and that any surplus may be distributed as the board of directors may decide in carrying out the co-operative purposes which underlie the organization. This is the big point in our institution. The average earnings on bank stock in the United States is 28 per cent, which goes to the stockholders. In the Brotherhood Bank, stockholders are restricted to 10 per cent, all over that amount being divided among savings depositors. We pay four per cent on savings accounts, compounded quarterly, in addition to which savings depositors share in the surplus savings. It is possible for depositors to receive as much in interest as the stockholders do in dividends.

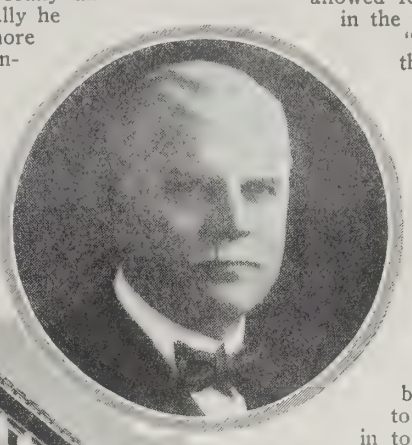
"In July, 1920, we mailed stock subscriptions to the 90,000 members of the brotherhood. During July not a dollar was received. In the latter part of August, subscriptions began to come in with the cash, and, by November 1, we had received $1,300,000, an over-subscription of $300,000. Deposits have been made at the rate of $1,000,000 a month for 15 months. The stream of money is still flowing. Our depositors live all over the United States from California to Maine."

The Brotherhood of Locomotive Engineers is housed in its own 14-story office building in Cleveland, a short block north of the public square. The bank occupies a building on the opposite side also owned by the brotherhood.

The bank occupies the basement and first floor, while the upper floors are rented for offices. Eventually, this building will be removed and a 21-story office and bank building erected.

Undoubtedly a great deal of money that had been hidden in old tin cans has been called into activity by this bank. People who were not suspected of having a dollar have opened accounts. Numerous business and professional men, in no way identified with labor organizations, carry accounts with the Brotherhood Bank. The institution is open to all and does a business similar to that of any national bank.

One day, a queer specimen of humanity entered and began making inquiries. He was a typical tramp. His clothes were old and baggy. Hair stuck through holes in his hat, and his face was covered with bristles. Although he seemed a very unpromising prospect, Mr. Stone talked with him pleasantly, and answered his questions carefully. Finally he shot out the query, uppermost in his mind:



"Say, if I should put some money in this bank could I get it out again?"

"Yes," replied Mr. Stone with a smile, "you can get it out any time you want it."

"All right," was the response, "I guess I'll leave some with you."

He began pulling out bills. He had money hidden in every pocket, in his shoes, in the lining of his coat, and under his hatband. The bills were crumpled and wadded, and had to be carefully unfolded and smoothed. Finally he counted the pile. It was more than a foot high and contained $762 in one-dollar bills.

While the bank does a good local business, a feature is made of "banking by mail." The fact that a labor organization is back of the institution inspires confidence and brings deposits from all classes. Money is placed in small banks to aid wheat growers, stock raisers, fruit men, and others who have difficulty in getting credit. Co-operative elevator enterprises are often helped. In one instance, the Brotherhood Bank bought up an issue of school warrants in a Nebraska town, supplying cash to teachers who had not received pay for months.

The building shown above was erected by the Brotherhood of Locomotive Engineers. President Warren S. Stone (shown above) has plans completed for the banking and office building shown at the right.

A striking instance occurred recently. A customer approached Mr. Stone and said:

"I want to borrow $100,000 on an apartment house worth $250,000. It is a perfectly good loan as the property is now paying 12 per cent."

"What are you going to do after you get the $100,000?" inquired Mr. Stone.

"Oh, I'll raise the rent on the apartments $50 all around, and then the investment will bring 15 per cent."

"Your security is good," replied Mr. Stone, "but we don't care to make the loan."

"Why, what's the matter?" asked the applicant, very much astonished.

"We refuse to loan to any man who is going to make living conditions harder, just as you propose to do by increasing your rents."

"Well, well," exclaimed the would-be borrower angrily, "if that is the way you intend to do business, you will soon be on the rocks." He walked out enraged.

Mr. Stone had not been in the banking business very long before he crossed the trail of the loan brokers, who make a living by charging a bonus for getting loans for clients. A loan had been granted to a widow, and when the final papers came to Mr. Stone he discovered that the note had been made out to draw 10 per cent interest in place of seven.

"How is this?" asked Mr. Stone. "This loan was allowed for seven per cent, but I see it is 10 per cent in the note."

"Oh," replied the broker who was handling the transaction, "the three per cent difference is my rake-off for getting the loan for her."

"That don't go in this bank," exclaimed Mr. Stone. "If this lady wants a loan she can get it in the regular way without paying anything to a broker."

"Why," exclaimed the broker, "there are 300 of us in Cleveland."

"I don't want any of them around here," said Mr. Stone.

Widows and orphans of locomotive engineers who belong to the brotherhood are the special care of the Brotherhood Bank. The brotherhood pays out between $2,500,000 and $3,000,000 a year in death benefits and many beneficiaries are not qualified to take care of the money. The bank steps in to safeguard the families from loss. Brotherhood men are being advised to make wills naming the bank as trustee so it can collect and manage insurance and other money that falls to the heirs and protect them from swindlers.

During an interview, Mr. Stone pulled a five-dollar bill from his pocket and held it up for inspection.

"I want to show you a curiosity," he remarked. "That is one of our first issue of currency, the first bank notes ever put into circulation by a labor organization bank anywhere in the history of the world. It is just as good as any other bank note. It was printed by the government and issued in the usual way. Our notes are in general circulation along with Federal Reserve notes and gold certificates."

The face of the note bore the inscription, "Brotherhood of Locomotive Engineers Co-operative Bank of Cleveland, will pay to the bearer on demand five dollars. Cleveland, Ohio, October 25, 1920. William B. Prenter, Cashier, Warren S. Stone, President."

The Brotherhood of Locomotive Engineers Building previously mentioned was erected without assessing the members of the organization. The brotherhood bought the land outright, and then erected the structure with borrowed money. Within 10 years the rentals had paid off the loan, and now the building stands free of debt. It cost $1,250,000. Recently the brotherhood rejected an offer of $3,000,000.

It was a long leap from the cab of an engine to the promoter of a $3,000,000 office building and the presidency of a $15,000,000 bank, but Mr. Stone made it. After serving as a fireman for five years, he ran an engine for 19 years and three months. In 1903 he became Grand Chief of the Brotherhood of Locomotive Engineers, and has been re-elected to that office six times unanimously. His term expires in 1924.

There is no organic connection between the engineers and other railway brotherhoods, but they pull together on a co-operative basis. Mr. Stone does not have the authority to call a strike of engineers, that being decided by vote of the members, but he does have the power to stop one after it has been ordered. He exercised that power about a year ago, and halted a strike after 95 per cent of the men had voted to go out. In other labor organizations, officers can call a strike without submitting the question to a vote. Stone led in the fight for a Federal eight-hour law for railway men, and on his wall, neatly framed, hangs the pen held by President Wilson in signing this law.

In extending the co-operative banking system, the Brotherhood of Locomotive Engineers has recently acquired control of the Peoples' State Banking & Trust Company, of Hammond, Indiana, and of the Nottingham Banking & Trust Company, Nottingham, Ohio. Other co-operative banks have been or are being formed in Detroit, St. Louis, Cincinnati, San Bernardino, Tucson, Philadelphia, Indianapolis, Birmingham, Minneapolis, Kansas City, Denver, Seattle and Spokane.

"Labor organizations are just beginning to find out," said Mr. Stone, "that after all it is the money of the people that is being used by the bankers for their own profit. For every dollar invested in a bank by a so-called capitalist, the people put in $12. In place of paying big dividends to non-productive stockholders, they can limit the dividends and divide the surplus. There is an immense field in which the co-operative idea can expand in America."

Another Diagnosis by Mr. Hays

"THIS country must have its amusement or it will go red," says Will H. Hays, high priest of moviedom. That is what they said in ancient Rome. So they had their amusement, and Rome did not go red, but rotten. There was a money question in ancient Rome; the interest question was pressing hard as it is today; elemental human rights sacredly belonging to every individual were overlooked in the false glare of general success; politics became increasingly corrupt, and social life grew infamously loose—and whoever the Will H. Hays of the period was, he said that Rome had to have her amusements or she would go red, or whatever the ancient equivalent to "red" may have been.

Besides being as old as the declining period of Rome, Mr. Hays' remedy is also as recent as the late prohibition of liquor. The increased social agitation which has come up since men's minds have been de-alcoholized is blamed on the absence of the saloon. It is perhaps true that the stupefaction procurable in the corner saloon might have postponed the social awakening for some years, maybe a generation. But on the other hand, it is also likely to be true that it was the social awakening which is responsible for getting the saloon out of the way as a hindrance to straight social thinking. Anyway, the cry we hear now is that "Bolshevism and the Reds would not have had a chance if we had kept the saloon." It is just a paraphrase of Mr. Hays—"This country must have its liquor or it will go red."

This country is not going "red." And it will not be liquor nor amusements that will prevent it. The American spirit is going to shake off its attitude of cowed subservience, is going to look its problems in the face, is going to ask its self-appointed rulers to stand aside, and is going to put its life on a basis of justice and progress. That will not be revolution, but the liberation of the nation from all its unnatural and uneconomic bondage. Nothing will suffer but unjust systems which cause suffering. But as for amusements helping, there is this to say: most of the revolutionary and immoral ideas now current have come to the popular mind through the channels of its amusements. Amusement has been subsidized by the vilest forms of propaganda.

The Help the Farmer Really Needs

BILLS in aid of agriculture are as plentiful in Congress as mosquitoes in damp weather, and quite as annoying. While all of them seek to improve the present cumbersome plan, which finances bankers rather than farmers, and others seek the replacement of the War Finance Board with another of like powers under a different designation, all have the same indirect method of reaching the beneficiary.

Most of the bills seek to reorganize the farm loan system by creating a second Federal Reserve System, and widening the scope to include not only the actual producers of crops and breeders of live stock, but all engaged in the marketing of agricultural production. Thus, warehouse receipts would suffice for collateral for loans, enabling trading agencies to turn over their capital more frequently.

Like the immense profits of the Federal Reserve System, these added profits in any of the proposed Farm Loan systems must be paid by producer and consumer; by producer in lower crop prices, and by consumer in enhanced retail prices. They are the goats. The schemes all seem to increase the opportunities for tolling the grist.

Agriculture has just two paths to permanent prosperity. The first must come gradually, the second is within reach in the near future.

Path No. 1 is to get out of debt and stay out.

Path No. 2 is to insist on the refunding of all maturing obligations of the government into non-interest (or a very low interest) bearing bonds carrying the circulation privilege, sell them to any organized bank without reserve and issue Treasury Notes to the amount of bonds deposited.

The notes would be the only currency in circulation; the bank of issue would be under no obligation to ask a central bank to rediscount its collateral, and could not be squeezed at will by the Money Trust. The farmer would have his paper in hands acquainted with his circumstances.

From the date (Nov. 27, 1914) of the opening of the Federal Reserve banks for business until October 26, 1921, the aggregate capital stock of the 12 regional banks has increased from $18,050,000 to $103,007,000, the surplus fund from nothing ($15,000,000 being declared at the end of the first year) to $213,834,000. Total assets rose during the same period from $270,018,000 to $5,094,915,000.

It must be remembered that these profits, fabulous as they seem, are not complete, since the last dividend of last year had not been paid when the figures were compiled and the last addition to the surplus had not been announced. Also that during all the time the shareholding banks have been receiving cumulative interest at six per cent, while enormous salaries and extravagant building reservations had been approved, and $124,000,000 in round numbers had been awarded the United States Treasury.

The plan here suggested would save to the people this immense USURY charge, and what profit came to the system would be shared in by the people to the extent of the saving in interest of the refunded bonds.

It's Going to Turn Out All Right!

ANOTHER step toward the restoration of amicable diplomatic relations between the United States and Mexico has been taken after extensive conferences in Wall Street, New York. The first important move in that direction was made when mining properties and ranches owned by persons influential in this country were afforded safeguards by the Obregon government.

The Wall Street conferences were attended by Adolfo de la Huerta, Mexican finance minister, and by representatives of the powerful international banking firms of the United States, England, Germany, France, Belgium, Holland and Switzerland. Discussions were held over the payment of the Mexican debt with its back interest. A rapprochement satisfactory to all was reached, the international bankers laying down terms for the operation of Mexican railways and other internal affairs of the republic below the Rio Grande.

The early period of the conferences was characterized by some predictions of failure, and some of the scary speculators let loose of their Mexican securities. But persons close to the negotiating influences retained their confidence. The satisfactory conclusion of arrangements between the international committee and the Mexican finance minister was followed naturally by a sharp rise in Mexican stocks, and those who bet that way are happy over the result.

Gradually, the obstacles to pleasant relations between the neighbor republics are being removed. The Obregon government is determined that no properties of belligerent American newspaper owners shall be destroyed, and reciprocally, interventionist American editors are beginning to believe that Mexico can govern itself properly. The assurance that Wall Street influences have confidence in the stability of the Mexican government leaves only the farmers and laborers in the United States and the peons in Mexico in the way of the complete restoration of diplomatic relations. And they are too busy working to cause trouble.

Fair and Warmer

IT WOULD be unjust for this world to go on another day, without a word of appreciation being said for that sublime philanthropist, the inventor of the electric fan.

His name is unhonored and unsung, but his glory will last as long as the sun shines. Somewhere, perhaps in some dusty encyclopedia, in the dim recesses of the patent office, in Who's Who, his name may be known. But, thanks to the pleasant zone which his invention provides, it is beyond mortal courage to labor forth into hot libraries to determine the identity of him we honor.

There are many persons who have sought to bestow great favors upon humankind. Millions of dollars have been given. Monks have spent their lives in dismal cells, seeking bits of learning with which to enrich mankind. Explorers have dared the perils of unknown lands. Patriots have offered their lives for liberty. But in all coolness, who has done more to make pleasant the human pathway than the inventor of the electric fan?

In Civilized America, A. D. 1922

THE following extract is from the Associated Press account of the mine riots at Herrin, Illinois:

"Out in a road near the mine, six men, tied together and all wounded by bullets and blows, lay in a scorching sun, while hundreds of men and women laughed at their pleas for water.

"One of the men, his face bloody and one shoulder shot away, apparently was within a few minutes of death.

"'Please, boys, give me a drink,' he moaned.

"A laugh from the hundreds of spectators was the only reply.

"The correspondent rushed to a house for water and when he returned he was faced by a sword and quickly drawn pistols and told to keep away.

"When the man begged again for water, 'for God's sake,' a young woman with a baby in her arms placed her foot on the mangled body and said:

"'I'll see you in hell before you get any water.'

"The men apparently had been dragged down a rock road behind an automobile. Their clothes were torn and pieces of gravel were imbedded in their mangled flesh.

"A miner told the Associated Press correspondent that he had seen 15 bodies thrown into a pond with rocks around their necks, Thursday. About 20 imported workers are missing."

The Right Method

SUPPORTERS of Philippine independence are buoyed with warm hope that the realization of their desire is near. The average observer can see little perceptible change in the attitude of the United States Congress toward this 23-year-old issue.

But a little consideration will show that the Filipinos are not entirely without warrant in their hope.

They are going to establish a publicity agency in the United States.

Manuel Quezon, president of the Senate, and Sergio Osmena, speaker of the House, are in the United States with a mission, advocating independence. They were received courteously at the White House, in the Capitol, and at various places throughout the country. They will shortly return home.

But their announcement that they plan to leave a publicity agency behind affords abundant food for thought. Think of what it will mean to have such justifiable arguments for independence as they possess, garnished with the sentimentalist adverbs, argumentative adjectives and convincing nouns with which the facile publicity man puts across his hokum! The Filipinos had but to consider the number of times the American people have been "sold," to determine that a splendid indirect advertising campaign was just the thing they needed. And if, as is to be expected, they just pick the right kind of a glad-hand operator to mix with the Congressmen in Washington, perhaps their dream of independence may not be so far-fetched after all.

Unheralded Legislation

THE United States Senate has passed a bill extending the corporate life of national banks, so that a renewal of charter will be for 99 years instead of 20, the present limitation. It is significant that a measure of so great importance should be disposed of without arousing discussion or even causing a serious division in the body acting on it.

The passage of this bill seems a step toward fixing the bank monopoly on the country. No provision is made for the issue of a national bank currency. In fact, the design of the ruling class now is to retire the national bank currency as rapidly as possible. After that has been done, the retirement of the greenback will follow and the country be limited to the Federal Reserve issues.

Of an interest-bearing indebtedness of practically 24 billions of dollars, less than a billion ($793,116,930) is available for national bank circulation. Eighty per cent of the amount available is in consols, falling due in 1930. Except for obligations aggregating $181,489,900, falling due in 1925, there is no chance to refund.

Here is a problem that requires study. Why should the limit of national bank charters be extended to perpetuity at a time when the object of their incorporation, the issue of money, is about to be eliminated by the expiration of the debt on which that circulation is based?
